CHAPTER 1

Introduction

This information explains Ansible and the Dell EMC Networking Ansible integration.

1.1 Ansible

Ansible is a simple agentless automation framework. It can configure systems, deploy software, and orchestrate more advanced IT tasks such as continuous deployments or zero downtime rolling updates. Ansible supports network automation as part of its core framework.

See Integration: Network Automation with Ansible for more information.

1.2 Dell EMC Networking Ansible integration

Starting with Ansible 2.3, the Ansible core supports Dell EMC Networking modules. You can use these to manage and automate your Dell EMC switches running OS6, OS9, and OS10. All modules are currently executed in local connection mode, using CLI and SSH transport.

See Integration: Ansible and Dell EMC Networking for more information.

CHAPTER 2

Installation

You can install Ansible roles on the control machine using Dell EMC Networking devices.

2.1 Ansible modules

Dell EMC Networking Ansible modules are part of the Ansible core. Install Ansible 2.3 or later to use these modules. See Ansible documentation for more information.

2.2 Ansible roles

Install all Dell EMC Networking Ansible roles.

```
ansible-galaxy install -r dellemc_roles.txt
```

where dellemc_roles.txt is defined as:

```
Dell-Networking.dellos-acl
Dell-Networking.dellos-bgp
Dell-Networking.dellos-copy-config
Dell-Networking.dellos-dcb
Dell-Networking.dellos-dns
Dell-Networking.dellos-ecmp
Dell-Networking.dellos-flow-monitor
Dell-Networking.dellos-image-upgrade
Dell-Networking.dellos-interface
Dell-Networking.dellos-lag
Dell-Networking.dellos-lag
Dell-Networking.dellos-logging
Dell-Networking.dellos-logging
Dell-Networking.dellos-ntp
Dell-Networking.dellos-prefix-list
```

```
Dell-Networking.dellos-qos
Dell-Networking.dellos-route-map
Dell-Networking.dellos-sflow
Dell-Networking.dellos-snmp
Dell-Networking.dellos-system
Dell-Networking.dellos-users
Dell-Networking.dellos-vlan
Dell-Networking.dellos-vrf
Dell-Networking.dellos-vrrp
Dell-Networking.dellos-vrrp
Dell-Networking.dellos-xstp
```

You can also install an individual Dell EMC Networking Ansible role using a single command. For example, to install the AAA role use ansible-galaxy install Dell-Networking.dellos.aaa.

See Ansible Galaxy for more information on Dell EMC Networking Ansible roles.

2.3 Dell EMC Networking devices

Dell EMC Networking devices require minimal configuration to run Ansible playbooks.

2.3.1 OS6

- 1. Create a username and password for Ansible.
- 2. Configure the Management interface (static/dynamic IP address).
- 3. Enable the SSH server.

```
console(config) # username admin password ansible@123
console(config) # enable password ansible@123
console(config) # interface out-of-band
console(conf-if) # ip address 10.16.148.79 255.255.255.0 10.16.148.254
console(conf-if) # exit
console(config) # ip ssh server
```

2.3.2 OS9

4

- 1. Create a username and password for Ansible.
- 2. Configure the Management interface (static/dynamic IP address).
- 3. Enable the SSH server.
- 4. Set the maximum connection rate limit.

```
Dell(config) # username ansible password ansible
Dell(config) # enable password ansible
Dell(config) # interface managementethernet 0/0
Dell(conf-if-ma-0/0) # ip add 10.16.148.72/24
Dell(conf-if-ma-0/0) # no shutdown
Dell(conf-if-ma-0/0) # exit
Dell(config) # ip ssh server enable
Dell(config) # ip ssh connection-rate-limit 60
```

2.3.3 OS10

- 1. Create an Ansible username and password.
- 2. Configure the Management interface (static/dynamic IP address).

```
OS10(config) # username ansible password ansible
OS10(config) # interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1) # ip address 10.16.149.62/16
OS10(conf-if-ma-1/1/1) # no shutdown
OS10(conf-if-ma-1/1/1) # do commit
OS10(conf-if-ma-1/1/1) # exit
```

- > **NOTE**: SSH is enabled in OS10 by default.
 - 3. 2017 Dell Inc. or its subsidiaries. All Rights Reserved.

CHAPTER 3

Dell EMC Networking Ansible modules

Note: Ansible has deprecated support for the template module (see Deprecations).

3.1 OS6 modules

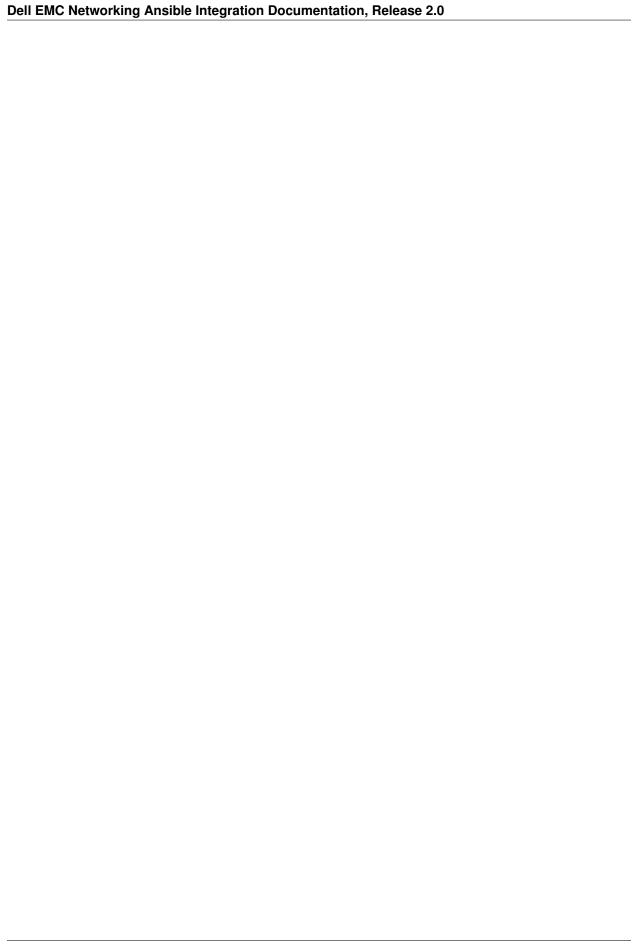

- dellos6_command: Run commands on remote devices running OS6
- dellos6_config: Manage configuration sections on remote devices running OS6
- dellos6_facts: Collect facts from remote devices running OS6

3.2 OS9 modules

- dellos9_command: Run commands on remote devices running OS9
- dellos9_config: Manage configuration sections on remote devices running OS9
- dellos9_facts: Collect facts from remote devices running OS9

3.3 OS10 modules

- dellos10_command: Run commands on remote devices running OS10
- dellos10_config: Manage configuration sections on remote devices running OS10
- dellos10_facts: Collect facts from remote devices running OS10

CHAPTER 4

Dell EMC Networking Ansible roles

The Dell EMC Networking Ansible roles facilitate device provisioning running Dell EMC Networking OS6, OS9, or OS10. This information describes the Dell EMC Networking Ansible roles.

4.1 AAA role

The dellos-aaa role facilitates the configuration of authentication authorization accounting (AAA), and supports the configuration of TACACS and RADIUS server and AAA.

Abstracted for OS9

4.2 ACL role

The dellos-acl role facilitates the configuration of an access control list (ACL). It supports the configuration of different types of ACLs (standard and extended) for both IPv4 and IPv6, and assigns the access-class to line terminals.

Abstracted for OS9

4.3 BGP role

The dellos-bgp role facilitates the configuration of border gateway protocol (BGP) attributes, and supports router ID, networks, neighbors, and maximum path configurations.

Abstracted for OS6 OS9 OS10

4.4 Copy-config role

The dellos-copy-config role pushes the backup running configuration into a device. This role merges the configuration in the template file with the running configuration of the Dell EMC Networking device.

Abstracted for OS6 OS9 OS10

4.5 DCB role

The dellos-dcb role facilitates the configuration of data center bridging (DCB), supports the configuration of DCB map and DCB buffer and assigns them to interfaces.

Abstracted for OS9

4.6 DNS role

The dellos-dns role facilitates the configuration of domain name service (DNS).

Abstracted for OS9

4.7 ECMP role

The dellos-ecmp role facilitates the configuration of equal cost multi-path (ECMP). It supports the configuration of ECMP for IPv4.

Abstracted for OS9

4.8 Flow-monitor role

The dellos-flow-monitor role facilitates the configuration of ACL flow-based monitoring attributes. Flow-based mirroring is a mirroring session in which traffic matches specified policies that are mirrored to a destination port. Port-based mirroring maintains a database that contains all monitoring sessions (including port monitor sessions).

Abstracted for OS10

4.9 Image-upgrade role

The dellos-image-upgrade role facilitates upgrades or installation of an OS10 software image.

Abstracted for OS6 OS9 OS10

4.10 Interface role

The dellos-interface role facilitates the configuration of interface attributes. It supports the configuration of administrative state, description, MTU, IP address, IP helper, and port mode.

Abstracted for OS10

4.11 LAG role

The dellos-lag role facilitates the configuration of link aggregation group (LAG) attributes. This role supports the creation and deletion of a LAG and its member ports, and supports the configuration of type (static/dynamic), hash scheme, and minimum required link.

Abstracted for OS6 OS9 OS10

4.12 LLDP role

The dellos-lldp role facilitates the configuration of link layer discovery protocol (LLDP) attributes at global and interface level. This role supports the configuration of hello, mode, multiplier, advertise tlvs, management interface, fcoe, iscsi at global and interface levels.

Abstracted for OS9 OS10

4.13 Logging role

The dellos-logging role facilitates the configuration of global logging attributes, and supports the configuration of logging servers.

Abstracted for OS6 OS9 OS10

4.14 NTP role

The dellos-ntp role facilitates the configuration of network time protocol attributes.

Abstracted for OS6 OS9 OS10

4.15 Prefix-list role

The dellos-prefix-list role facilitates the configuration of a prefix-list, supports the configuration of IP prefix-list, and assigns the prefix-list to line terminals.

Abstracted for OS9

4.16 QoS role

The dellos-qos role facilitates the configuration of quality of service attributes including policy-map and class-map.

Abstracted for OS10

4.17 Route-map role

The dellos-route-map role facilitates the configuration of route-map attributes.

Abstracted for OS10

4.11. LAG role 11

4.18 sFlow role

The dellos-sflow role facilitates the configuration of global and interface-level sflow attributes. This role supports the configuration of sflow collectors at the global level, enabling and disabling of sflow and specification of sflow polling-interval, sample-rate, max-datagram sizs, and so on are supported at interface and global levels.

Abstracted for OS9

4.19 SNMP role

The dellos-snmp role facilitates the configuration of global snmp attributes. It supports the configuration of SNMP server attributes like users, group, community, location, traps, and so on.

Abstracted for OS9 OS10

4.20 System role

The dellos-system role facilitates the configuration of global system attributes. This role specifically enables configuration of hostname, NTP server, and enables the password for dellos6, dellos9, and dellos10. dellos9 supports the configuration of the management route, hash alogrithm, clock, line terminal, banner and reload type.

Abstracted for OS6 OS9 OS10

4.21 Users role

The dellos-users role facilitates the configuration of global system user attributes. This role supports the configuration of CLI users.

Abstracted for OS6 OS9 OS10

4.22 VLAN role

The dellos-vlan role facilitates configuring virtual LAN (VLAN) attributes. This role supports the creation and deletion of a VLAN and its member ports.

Abstracted for OS6 OS9 OS10

4.23 VLT role

The dellos-vlt role facilitates the configuration of the basics of virtual link trunking (VLT) to provide a loop-free topology.

Abstracted for OS9 OS10

4.24 VRF role

The dellos-vrf role facilitates the configuration of basic virtual routing and forwarding (VRF) that helps in the partition of physical routers to multiple virtual routers.

Abstracted for OS9

4.25 VRRP role

The dellos-vrrp role facilitates configuration of virtual router redundancy protocol (VRRP) attributes. This role supports the creation of vrrp groups for interfaces, and setting the vrrp group attributes.

Abstracted for OS6 OS9 OS10

4.26 xSTP role

The dellos-xstp role facilitates the configuration of xSTP attributes. This role supports multiple version of spanning-tree protocol (STP), rapid spanning-tree (RSTP) protocol, multiple spanning-tree (MST), and per-VLAN spanning-tree (PVST). This role supports the configuration of bridge priority, enabling and disabling spanning-tree, creating and deleting instances, and mapping virtual LAN (VLAN) to instances.

Abstracted for OS6 OS9 OS10

4.24. VRF role 13

CHAPTER 5

Support matrix of Dell EMC Networking Ansible roles

This table shows the support matrix between Ansible roles and Dell EMC Networking OS6, OS9, and OS10.

Role	OS6	OS9	OS10
dellos-aaa	No	Yes	Yes
dellos-acl	No	Yes	Yes
dellos-bgp	Yes	Yes	Yes
dellos-copy-config	No	Yes	Yes
dellos-dcb	No	Yes	Yes
dellos-dns	No	Yes	Yes
dellos-ecmp	No	Yes	Yes
dellos-flow-monitor	No	No	Yes
dellos-image-upgrade	No	No	Yes
dellos-interface	Yes	Yes	Yes
dellos-lag	Yes	Yes	Yes
dellos-lldp	No	Yes	Yes
dellos-logging	Yes	Yes	Yes
dellos-ntp	Yes	Yes	Yes
dellos-prefix-list	No	Yes	Yes
dellos-qos	No	No	Yes
dellos-route-map	No	No	Yes
dellos-sflow	No	Yes	Yes
dellos-snmp	Yes	Yes	Yes
dellos-system	Yes	Yes	Yes
dellos-users	Yes	Yes	Yes
dellos-vlan	Yes	Yes	Yes
dellos-vlt	No	Yes	Yes
dellos-vrf	No	Yes	Yes
dellos-vrrp	Yes	Yes	Yes
dellos-xstp	Yes	Yes	Yes

Dell EMC Networking Ansible module examples

These module examples explain how to create a simple Ansible playbook, run the Dell EMC Networking Ansible modules, then configure a switch using Ansible roles.

6.1 Create simple Ansible playbook

1. Create an inventory file called *inventory.yaml* and specify the IP address.

```
spine1 ansible_host=10.11.182.16
```

2. Create a host variable file called *host_vars/spine1.yaml* then define the host, credentials, and transport.

```
hostname: spine1
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_become_method: enable
ansible_become: yes
ansible_become_pass: xxxxx
ansible_network_os: xxxxx
```

3. Create a playbook called *showver.yaml*.

```
hosts: spine1
connection: network_cli
gather_facts: no

tasks:
- name: "Get Dell EMC OS9 Show version"
  dellos9_command:
    commands: ['show version']
  register: show_ver
- debug: var=show_ver
```

4. Run the playbook

ansible-playbook -i inventory.yaml showver.yaml

6.2 Run Dell EMC Networking Ansible examples

Use these sample Ansible playbooks to understand how to use Dell EMC Networking Ansible modules.

6.2.1 Installation and setup

- 1. Install Ansible.
- 2. Clone the Ansible-dellos-examples repository in the control machine.
- 3. Update the *inventory.yaml* file to configure the device IP.
- 4. Update the corresponding host variables (use hosts_var/dellos10_sw1.yaml for device credentials).

OS6

dellos6_facts module that collects the facts from the OS6 device example

```
ansible-playbook -i inventory.yaml getfacts_os6.yaml
```

dellos6_command module that executes the show version command example

```
ansible-playbook -i inventory.yaml showver_os6.yaml
```

dellos6_config module that configures the hostname on the OS6 device example

```
ansible-playbook -vvv -i inventory.yaml hostname_os6.yaml
```

OS9

dellos9_facts module that collects the facts from the OS9 device example

```
ansible-playbook -i inventory.yaml getfacts_os9.yaml
```

dellos9_command module that executes the show version command example

```
ansible-playbook -i inventory.yaml showver_os9.yaml
```

dellos9_config module that configures the hostname on the OS9 device example

```
ansible-playbook -vvv -i inventory.yaml hostname_os9.yaml
```

OS10

dellos10_facts module that collects the facts from the OS10 device example

```
ansible-playbook -i inventory.yaml getfacts_os10.yaml
```

dellos10_command module that executes the show version command example

```
ansible-playbook -i inventory.yaml showver_os10.yaml
```

dellos10_config module that configures the hostname on the OS10 device example

```
ansible-playbook -vvv -i inventory.yaml hostname_os10.yaml
```

6.3 Playbook using Ansible roles example

Use these examples to configure the switch using Ansible roles.

1. Create an inventory file called *inventory.yaml* and specify the device IP address.

```
spine1 ansible_host= <ip_address>
```

2. Create a host variable file called *host_vars/spine1.yaml* then define the host, credentials, and transport.

```
hostname: dellos9
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_become: yes
ansible_become_method: enable
ansible_become_pass: xxxxx
ansible_network_os: dellos9
dellos_interface:
        fortyGigE 0/32:
         desc: "Connected to Spine1"
          portmode:
          switchport: False
          mtu: 2500
          admin: up
          ipv6_and_mask: 2001:4898:5808:ffa2::5/126
          suppress_ra : present
         ip_type_dynamic: true
         ip_and_mask: 192.168.23.22/24
         class_vendor_identifier: present
          option82: true
          remote_id: hostname
        fortyGigE 0/20:
          portmode:
          switchport: False
        fortyGigE 0/64:
          portmode:
          switchport: True
        fortyGigE 0/60:
          portmode:
          switchport: True
        fortyGigE 0/12:
```

```
portmode:
         switchport: True
       loopback 0:
          ip_and_mask: 1.1.1.1/32
          admin: up
       Port-channel 12:
         switchport: True
dellos_vlan:
       vlan 100:
         name: "Mgmt Network"
         description: "Int-vlan"
         tagged_members:
                - port: fortyGigE 0/60
                 state: present
          untagged_members:
                - port: fortyGigE 0/12
                 state: present
          state: present
```

3. Create a playbook called *switch_config.yaml*.

```
---
- hosts: dellos9
gather_facts: no
connection: network_cli
roles:
- Dell-Networking.dellos-interface
- Dell-Networking.dellos-vlan
```

4. Run the playbook.

```
ansible-playbook -i inventory.yaml switch_config.yaml
```

Provision CLOS fabric using Dell EMC Networking Ansible modules example

This example describes how to use Ansible to build a CLOS fabric with Dell EMC Networking OS10 switches. The sample topology is a two-tier CLOS fabric with two spines and four leafs connected as mesh. EBGP is running between the two tiers.

All switches in spine have the same AS number, and each leaf switch has a unique AS number. All AS number used are private. For application load-balancing purposes, the same prefix is advertised from multiple leaf switches and uses BGP multipath relax feature.

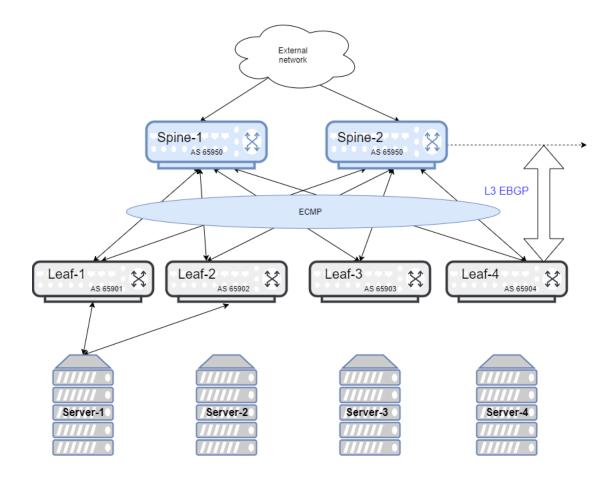

7.1 Creating a Simple Ansible Playbook

Step 1

Create an inventory file called inventory.yaml and specify the device IP address:

```
spine1 ansible_host=10.11.182.25
spine2 ansible_host=10.11.182.26
leaf1 ansible_host=10.11.182.27
leaf2 ansible_host=10.11.182.28
leaf3 ansible_host=10.11.182.29
leaf4 ansible_host=10.11.182.30

[spine]
spine1
spine2
[leaf]
leaf1
leaf2
leaf3
leaf4
```

```
[datacenter:children]
spine
leaf
```

Step 2

Create a host variable file called host_vars/spine1.yaml, then define the host, credentials and transport:

```
hostname: spine1
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_network_os: dellos10
dellos_interface:
    ethernet 1/1/1:
           desc: "Connected to leaf 1"
            mtu: 9216
            portmode:
            admin: up
            switchport: False
            ip_and_mask: 100.1.1.1/24
            ipv6_and_mask: 2001:100:1:1::1/64
            state_ipv6: present
    ethernet 1/1/17:
            desc: "Connected to leaf 2"
            mtu: 9216
            portmode:
            admin: up
            switchport: False
            ip_and_mask: 100.1.33.1/24
            ipv6_and_mask: 2001:100:1:21::1/64
            state_ipv6: present
    ethernet 1/1/25:
            desc: "Connected to leaf 3"
            mtu: 9216
            portmode:
            admin: up
            switchport: False
            ip_and_mask: 100.1.17.1/24
            ipv6_and_mask: 2001:100:1:11::1/64
            state_ipv6: present
    ethernet 1/1/9:
            desc: "Connected to leaf 4"
            mtu: 9216
            portmode:
            admin: up
            switchport: False
            ip_and_mask: 100.1.49.1/24
            ipv6_and_mask: 2001:100:1:31::1/64
            state_ipv6: present
dellos_bgp:
   asn: 64901
    router_id: 100.0.1.1
    best_path:
       as_path: multipath-relax
       as_path_state: present
       med:
       - attribute: missing-as-worst
```

```

```

Step 3

Create a playbook called datacenter.yaml:

```
---
- hosts: datacenter
gather_facts: no
connection: network_cli
roles:
- Dell-Networking.dellos-interface
- Dell-Networking.dellos-bgp
- Dell-Networking.dellos-snmp
```

Step 4

Execute the playbook:

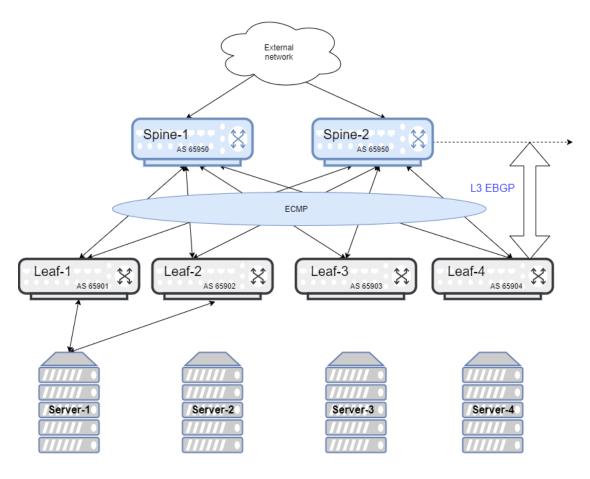

ansible-playbook -i inventory.yaml datacenter.yaml

3. 2017 Dell Inc. and its subsidiaries. All Rights Reserved.

Provisioning hot swap use case using Dell EMC Networking Ansible modules

This example use case topology includes a simple two-tier CLOS fabric with 2 spines and 4 leafs. These steps will show how you Spine 2 will be hot swapped without traffic loss.

8.1 Create simple Ansible playbook

- Part 1 covers creating an inventory file and host variable file for spine2, creating a pre-step hot swap playbook, then running the playbook
- Part 2 covers creating an inventory file and host variable file for each leaf (4), creating a playbook to delete the ecmp path for spine2 from each leaf, then running the playbook
- Part 3 covers replacing spine2 with a new switch, booting an OS10 image, creating inventory and host variable files for the new spine2, creating a post hot swap playbook, then running the playbook

8.1.1 Part 1

Refer to the CLOS fabric example to configure a 6 node CLOS fabric with EBGP. Use the example and run the playbook.

Create an inventory file called *inventory* yaml, then specify the device IP address for spine2.

```
spine2 ansible_host=10.16.204.57

[spine]
spine2

[leaf]
[datacenter:children]
spine
```

Create a host variable file called host vars/spine2.yaml, then define the host and credentials.

- Take a backup of the running configuration to a remote location
- Shut down the BGP neighbors in the hot swap switch to avoid traffic drop

```
hostname: spine2
ansible_ssh_user: xxxxx
ansible ssh pass: xxxxx
ansible_network_os: dellos10
copy_running_remote:
    - copy_type: scp
     username: linuxadmin
     password: linuxadmin
     host_ip: 10.16.204.62
      file_path: /home/linuxadmin/running-config
dellos_bgp:
   asn: 64901
   neighbor:
      - type: ipv4
        remote_asn: 64801
        ip: 100.2.1.2
        admin: down
        state: present
      - type: ipv4
        remote_asn: 64802
        ip: 100.2.33.2
```

(continues on next page)

```
admin: down
   state: present
  - type: ipv4
   remote_asn: 64803
    ip: 100.2.17.2
    admin: down
   state: present
  - type: ipv4
   remote_asn: 64804
   ip: 100.2.49.2
   admin: down
   state: present
  - type: ipv6
   remote_asn: 64801
   ip: 2001:100:2:1::2
   admin: down
   state: present
  - type: ipv6
    remote_asn: 64802
   ip: 2001:100:2:11::2

  - type: ipv6
   remote_asn: 64804
   ip: 2001:100:2:31::2
   admin: down
   state: present
state: present
```

Create a playbook called hot_swap_pre_step.yaml:

```
- hosts: datacenter
 gather_facts: no
 connection: network_cli
   tasks:
      - name: Assembling configfurations
       assemble: src={{ build_dir }} dest={{ build_dir }}/{{hostname}}.conf regexp=
\rightarrow'\\S_{{hostname}}\\S'
      - name: "copy running config to remote location"
        dellos10_command:
          commands:
             - command: 'copy running-configuration {{item.copy_type}}://{{item.
→username}}:{{item.password}}@{{item.host_ip}}:{{item.file_path}}'
               #If the switch asks for credentials for copy command, use the below_
\rightarrowcommented statements to give the prompt and password
               #prompt: 'admin:'
               #answer: 'admin'
        with_items: '{{copy_running_remote}}'

    hosts: datacenter

 connection: network_cli
 vars:
```

(continues on next page)

```
build_dir: "/root/debug"
roles:
   - Dell-Networking.dellos-bgp
```

Run the playbook.

```
ansible-playbook -i inventory.yaml hot_swap_pre_step.yaml
```

8.1.2 Part 2

1. After shutting the neighborship in the spine2 switch, check if the ECMP path to spine2 is deleted in each of the leaf switches.

Create an inventory file called inventory. yaml, then specify the device IP address of all leaf switches:

```
leaf1 ansible_host=10.16.204.27
leaf2 ansible_host=10.16.204.28
leaf3 ansible_host=10.16.204.29
leaf4 ansible_host=10.16.204.30

[spine]

[leaf]
leaf1
leaf2
leaf3
leaf4

[datacenter:children]
leaf
```

Create a host variable file called host_vars/leaf1.yaml, then define the host and credentials. The remote_neighbor_ip is the EBGP neighbor IP of spine2 with each of each leaf switch (see the CLOS fabric example for EBGP configuration):

```
hostname: leaf1
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_network_os: dellos10
remote_neighbor_ip: "100.2.1.1"
```

Create a host variable file called host_vars/leaf2.yaml, then define the host and credentials:

```
hostname: leaf2
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_network_os: dellos10
remote_neighbor_ip: "100.2.17.1"
```

Create a host variable file called host_vars/leaf3.yaml, then define the host and credentials:

```
hostname: leaf3
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
```

(continues on next page)

```
ansible_network_os: dellos10
remote_neighbor_ip: "100.2.33.1"
```

Create a host variable file called host_vars/leaf4.yaml, then define the host and credentials:

```
hostname: leaf4
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_network_os: dellos10
remote_neighbor_ip: "100.2.49.1"
```

Create a playbook called waitfor_ecmp_path_delete.yaml

Note: A debug message will print when the ECMP path for spine2 is deleted in each of the leaf switches.

```
- hosts: datacenter
 gather_facts: no
 connection: network_cli
 vars:
   build_dir: "/root/debug"
 tasks:
   - name: Assembling configfurations
       assemble: src={{ build_dir }} dest={{ build_dir }}/{{hostname}}.conf regexp=
→'\\S {{hostname}}\\S'
   - name: "Wait for spine2 routes delete in {{ hostname }}"
       dellos10_command:
         commands:
            - command: "show ip route bgp | grep {{ remote_neighbor_ip }}"
     retries: 10
     delay: 5
     register: result
     until: result.stdout[0] == ""
       msq: "{{ hostname }} has deleted the ECMP to spine2 switch"
     when: result.stdout[0] == ""
```

1. Execute the playbook.

ansible-playbook -i inventory.yaml waitfor_ecmp_path_delete.yaml

8.1.3 Part 3

- 1. After checking the spine2 ECMP path deletion in all leaf switches, replace spine2 with a new switch. The new spine2 switch should be connected as the old spine switch after it boots up with an OS10 image.
 - Manually assign the same spine2 management IP address (for example, 10.16.204.57)
 - Use the Management IP provided by the DHCP server
- 2. Create an inventory file called *inventory.yaml*, then specify the device IP address for spine2. The device IP can be same spine2 IP or an IP obtained from the DHCP server (x.x.x.x).

```
spine2 ansible_host=x.x.x

[spine]
spine2

[leaf]
[datacenter:children]
spine
```

1. Create a host variable file called *host_vars/spine2.yaml*, then define the host, credentials, and apply the same backup configuration that was saved earlier.

```
hostname: spine2
ansible_ssh_user: xxxxx
ansible_ssh_pass: xxxxx
ansible_network_os: dellos10

copy_remote_running:
    - copy_type: scp
    username: linuxadmin
    password: linuxadmin
    host_ip: 10.16.204.62
    file_path: /home/linuxadmin/running-config
```

Create a playbook called hot_swap_post_step.yaml

```
    hosts: datacenter

 gather_facts: no
 connection: network_cli
   tasks:
     - name: Assembling configfurations
       assemble: src={{ build_dir }} dest={{ build_dir }}/{{hostname}}.conf regexp=
→'\\S_{{hostname}}\\S'
     - name: "copy running config to remote location"
       dellos10_command:
         commands:
            - command: 'copy {{item.copy_type}}://{{item.username}}:{{item.password}}
→@{{item.host_ip}}:{{item.file_path}} running-configuration'
               #If the switch asks for credentials for copy command, use the below.
→commented statements to give the prompt and password
               #prompt: 'admin:'
               #answer: 'admin'
       with_items: '{{copy_remote_running}}'
```

Execute the playbook:

```
ansible-playbook -i inventory.yaml hot_swap_post_step.yaml
```

Install or upgrade devices running Dell EMC Networking OS10 using Ansible

This example explains how to use Ansible to install or upgrade the software image on a device running Dell EMC Networking OS10. The example playbook uses the *dellos-image-upgrade* role to upgrade or install an OS10 image on a specified switch. Before using Ansible to install the software image, you must download the software image via FTP/TFTP/SCP/HTTPDS, then specify the path to the image in the playbook.

The dellos-image-upgrade role uses the dellos10_command to install or upgrade the switch, then and wait_for is used to identify the progress of the upgrade operation. Validation of the upgrade operation is handled using the dellos10_facts module.

9.1 Creating simple Ansible playbook

9.1.1 Step 1

Create an inventory file called inventory.yaml, then specify the device IP address.

```
spine1 ansible_host=2.2.2.1
[spine]
spine1
[datacenter:children]
spine
```

9.1.2 Step 2

Create a host variable file called host_vars/spine1.yaml then define the host, credentials, and transport:

9.1.3 Step 3

Create a playbook called datacenter.yaml:

```
---
- hosts: datacenter
gather_facts: no
connection:network_cli
roles:
- Dell-Networking.dellos-image-upgrade
```

9.1.4 Step 4

Execute the playbook:

```
ansible-playbook -i inventory.yaml datacenter.yaml
```

Frequently asked questions

You can easily find answers to commonly asked questions about Dell EMC Networking Ansible modules and roles.

- Q: Which version of Ansible supports Dell EMC Networking Ansible modules?
- A: Ansible 2.2 and later.
- Q: What are the minimum OS versions for Ansible support?
- A: OS version 6.3.1 and above; OS version 9.10.0.1P13 and above; OS version 10.2 and later.
- Q: What do the Dell EMC Networking Ansible roles provide?
- A: The roles are a package of multiple Dell EMC Networking OS features which are provided for easy installation, configuration, and packaging. They currently contain configuration for system, interface, VLAN, LAG, BGP, and xSTP.
- Q: Do Dell EMC Networking Ansible roles work with Ansible Tower?
- A: Yes, these roles work with Ansible Tower for management.
- Q: Is there dnosX_template module support for OS6/OS9/OS10?
- A: No. Ansible has deprecated support for the template module, replacing it with the config module (see Deprecations).

Dell EMC Networking Ansible Integration Documentation, Release 2.0	

Release notes

This information contains the release notes for Dell EMC Networking Ansible support.

11.1 Release 3.0.0

This release introduces new roles:

- · dellos-copy-config
- · dellos-flow-monitor
- dellos-image-upgrade
- dellos-ntp
- dellos-qos
- dellos-route-map

11.2 Release 2.0.0

This release introduces new roles:

- dellos-aaa
- dellos-acl
- dellos-dcb
- dellos-dns
- dellos-ecmp
- dellos-lldp
- · dellos-prefix-list

- · dellos-sflow
- · dellos-vlt
- · dellos-vrf
- dellos-vrrp
- · dellos-snmp*
- · dellos-users*
- · dellos-logging*

Note: Roles with an asterisk (*) are part of dellos-system role in version 1.0.0.

11.3 Release 1.0.0

This release introduces:

- Initial Ansible support for Dell EMC Networking OS6, OS9, and OS10.
- New modules:
 - dellos6_command
 - dellos6_config
 - dellos6_facts
 - dellos9_command
 - dellos9_config
 - dellos9_facts
 - dellos10_command
 - dellos10_config
 - dellos10_facts
- New roles:
 - dellos-bgp
 - dellos-interface
 - dellos-lag
 - dellos-system
 - dellos-vlan
 - dellos-xstp
- Known issues:
 - dellos9_command ansible hangs after reload command issued to remote device (see Issue 5462)
 - dellos9_command confirm prompt timeout (see Issue 5534)

Support

You can submit issues for Dell EMC Networking modules at Ansible Github Issues.

Submit issues for Dell EMC Networking roles at:

- dellos-aaa role
- dellos-acl role
- dellos-bgp role
- dellos-copy-config role
- dellos-dcb role
- dellos-dns role
- dellos-ecmp role
- dellos-flow-monitor role
- dellos-image-upgrade role
- dellos-interface role
- dellos-lag role
- dellos-lldp role
- dellos-logging role
- dellos-ntp role
- dellos-prefix-list role
- dellos-qos role
- dellos-route-map role
- · dellos-sflow role
- dellos-snmp role
- dellos-system role

- dellos-users role
- dellos-vlan role
- dellos-vlt role
- dellos-vrf role
- dellos-vrrp role
- dellos-xstp role
