
Cece Documentation

Release 0.1.0

Dave Korhumel

November 22, 2016

1	Contents	3
1.1	Getting Started	3
1.2	Code Documentation	3
2	Quickstart	7
3	Indices and tables	9
	Python Module Index	11

Cece is a static site generator for how to sites.

Contents

1.1 Getting Started

Coming soon!

1.2 Code Documentation

1.2.1 `cece.compiler`

The compiler takes a parsed set of guides and compiles and writes the output to the file system.

`class cece.compiler.Compiler(config, guides)`

The compiler object.

Parameters

- `config (dict)` – The configuration
- `guides (dict)` – The parsed set of guides to output

`_make_id_url(id)`

Make url from an id.

Parameters `id (string)` – The id to form into a url

`compile()`

Compile the provided guides and write out the result to the file system.

`_compile_folder(path, folder)`

Compile a folder, which is a listing of links to other folders or pages.

Parameters

- `path (string)` – The path of the folder
- `folder (dict)` – The data for the folder

`_compile_page(path, page)`

Compile a page.

Parameters

- `path (string)` – The path of the page
- `page (dict)` – The data for the page

1.2.2 cece.main

The main module for cece. This contains the entry point for the application.

`cece.main.main()`

The main entry point for cece.

1.2.3 cece.parser

The parser reads the files and metadata from the file system, and builds a list of files to write out to the file system.

Functions

`cece.parser._get_breadcrumbs(path)`

A utility method for getting the breadcrumb links from a path. They are built by repeatedly taking the dirname of the path.

For example, "category1/category2/variant1/variant2" would produce:

```
[  
    "category1",  
    "category1/category2",  
    "category1/category2/variant1",  
    "category1/category2/variant1/variant2"  
]
```

Classes

`class cece.parser.ParsingException(path, message)`

A custom exception that is thrown when there are errors parsing the files.

Parameters

- **path** (*string*) – The path of the file that raised the exception
- **message** (*string*) – The error message

`class cece.parser.Parser(config)`

The parser object.

Parameters **config** (*dict*) – The configuration

`parse()`

Parse the files and cache the parsed result.

Returns The parsed files, as a dictionary

`_load_folder(meta, path)`

Load the contents of a folder into the cache.

Parameters

- **meta** (*dict*) – The meta data for the folder
- **path** (*string*) – The path of the folder

`_load_guide(meta, path)`

Load the contents of the guide into the cache.

Parameters

- **meta** (*dict*) – The meta data for the guide
- **path** (*string*) – The path to the guide folder

`_load_dirs(root_dir)`

Load a directory and its children.

Parameters `root_dir` (*string*) – The path to the root dir to parse

1.2.4 `cece.util`

Utilities for cece

`cece.util.load_yaml_file(path)`

Open and read a file, convert the contents to yaml, and close the file.

Parameters `path` (*string*) – Path to the yaml file

Returns The parsed yaml file contents

`cece.util.natural_sort(lst, key=<function <lambda>>)`

Sort a list in a natural way.

This works by splitting the key, which must be a string, into string and integer parts. The list of all of those parts is then used as a key for Python's built in sort function.

Parameters

- **lst** (*list*) – The list to sort
- **key** (*function*) – The key function to use

`cece.util.makedirs(path)`

Safely make a directory by ensuring every parent directory is created.

Parameters `path` (*string*) – The directory to create

`cece.util.iterate_list_subsets(lst)`

Iterate over the sublists of the given list. Each sublist starts at the beginning of the given list, and is one item longer than the previous one.

For example, [1, 2, 3, 4, 5] would yield:

- [1]
- [1, 2]
- [1, 2, 3]
- [1, 2, 3, 4]
- [1, 2, 3, 4, 5]

Parameters `lst` (*list*) – The list to iterate

Returns An iterator over the sublists

CHAPTER 2

Quickstart

Coming soon!

Indices and tables

- modindex
- search

C

`cece.compiler`,³
`cece.main`,⁴
`cece.parser`,⁴
`cece.util`,⁵

Symbols

`_compile_folder()` (`cece.compiler.Compiler` method), [3](#)
`_compile_page()` (`cece.compiler.Compiler` method), [3](#)
`_get_breadcrumbs()` (in module `cece.parser`), [4](#)
`_load_dirs()` (`cece.parser.Parser` method), [5](#)
`_load_folder()` (`cece.parser.Parser` method), [4](#)
`_load_guide()` (`cece.parser.Parser` method), [4](#)
`_make_id_url()` (`cece.compiler.Compiler` method), [3](#)

C

`cece.compiler` (module), [3](#)
`cece.main` (module), [4](#)
`cece.parser` (module), [4](#)
`cece.util` (module), [5](#)
`compile()` (`cece.compiler.Compiler` method), [3](#)
`Compiler` (class in `cece.compiler`), [3](#)

I

`iterate_list_subsets()` (in module `cece.util`), [5](#)

L

`load_yaml_file()` (in module `cece.util`), [5](#)

M

`main()` (in module `cece.main`), [4](#)
`makedirs()` (in module `cece.util`), [5](#)

N

`natural_sort()` (in module `cece.util`), [5](#)

P

`parse()` (`cece.parser.Parser` method), [4](#)
`Parser` (class in `cece.parser`), [4](#)
`ParsingException` (class in `cece.parser`), [4](#)
