CHAPTER 1

Code Documentation

The code library and toolbox consist of two principle types of software - ready to use programs and tools as well as reusable components designed to be used in other scripts and programs. This portion of the documentation focuses on the latter

remote_cam.py

```
code_library.common.image.remote_cam.get_remote_cam_image_metadata(image_name,  
                           strip_units=True)  
  
code_library.common.image.remote_cam.get_baropressures_from_image_folder(folder,  
                           strip_units=True)  
    Gets the baropressures, datetimes, and sites, from all of the remote camera images in a folder, and creates  
    a dict for each image with those data. Returns a list containing a dict for each image. image data keys are  
    ('site','datetime','baropressure','filename') :param folder: a fully qualified path to a folder containing jpg im-  
    ages with remote-cam baropressures in the EXIF :return: list of dicts containing image data  
  
code_library.common.image.remote_cam.baropressures_to_file(input_folder,  
                           output_file,  
                           strip_units=True)  
    Obtains metadata for all of the remote camera images in an input folder, and writes it out to a csv :param  
    input_folder: str The folder to get the images from :param output_file: str The file to write out to :param  
    strip_units: boolean Whether or not to include units in the data elements that contain them. If True, units will  
    removed from output. If False, they will be included. Default: True :return: None
```

CHAPTER 2

Indices and tables
