Contents:

# CHAPTER 1

---

Stm32

---

## 1.1 Udev rules

Copy *49-stlinkv2.rules* and *99-dfu.rules* from this repo to */etc/udev/rules.d*.

Reload udev rules by running:

```
sudo udevadm control --reload-rules && udevadm trigger
```

## 1.2 Firmware Build Dependencies

Install by running:

```
sudo add-apt-repository ppa:team-gcc-arm-embedded/ppa
sudo apt-get update
sudo apt-get install gcc-arm-embedded
sudo apt-get install openocd
sudo add-apt-repository ppa:jonathonf/tup && sudo apt-get update && sudo apt-get
→install tup
```

Install python 3.7:

```
sudo apt install python3.7-dev
```

Set python3.7 to default python version in bash:

```
echo "alias python=python3.7" >> ~/.bash_aliases
```

Verify successful installation and versions:

```
arm-none-eabi-gcc --version
arm-none-eabi-gdb --version
openocd --version          # should be 0.10.0 or later
tup --version               # should be 0.7.5 or later
python --version            # should be 3.7 or lat
```

## 1.3 Visual Studio Code

Download and install [Visual Studio Code](#).

Extensions:

- C/C++
- Cortex-Debug
- PlatformIO IDE

# CHAPTER 2

---

## Docker

---

Install docker by running:

```
sudo apt update
sudo apt install apt-transport-https ca-certificates curl software-properties-common
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -
sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu_
↳ bionic stable"
sudo apt update
sudo apt install docker-ce
```

Check that installation is successful:

```
sudo systemctl status docker
```

Run docker without sudo:

```
sudo usermod -aG docker ${USER}
```

Restart the computer for the groups to update.

Install docker-compose by running:

```
sudo curl -L https://github.com/docker/compose/releases/download/1.21.2/docker-
compose-`uname -s`-`uname -m` -o /usr/local/bin/docker-compose
sudo chmod +x /usr/local/bin/docker-compose
```

# CHAPTER 3

---

CAN

---

## 3.1 USB-CAN

We at Dyno use two slightly different clones of the Lawicel CANUSB USB can interface.

- 70200 from Auvidea with muCAN firmware
- CANable with cantact firmware

Full instructions for setup and troubleshooting with socketcan on Linux can be found [here](#).

Here are the necessary steps in short form:

- Copy 90-slcan.rules from [this repo](#) to /etc/udev/rules.d/.
- Copy the contents of the slcan folder in this repo to /usr/local/bin and make sure the scripts are executable.
- Run sudo apt-get install can-utils at in a terminal.
- Add can, can\_raw and slcan to /etc/modules as a list (each goes in a separate line).
- Restart the computer.

---

**Note:** With this default setup, the speed of the CAN bus is set to 1000 Kbit/s

We also have a PCAN-USB interface.

---

To test that everything is working, connect an interface run candump can0 in one terminal and cansend can0 123#DEADBEEF.

You should see the message you sent in the terminal where you ran candump.

# CHAPTER 4

---

C#

---

## 4.1 .NET

Install .NET Core for Linux.

```
wget -q https://packages.microsoft.com/config/ubuntu/18.04/packages-microsoft-prod.deb  
sudo dpkg -i packages-microsoft-prod.deb  
sudo add-apt-repository universe  
sudo apt-get install apt-transport-https  
sudo apt-get update  
sudo apt-get install dotnet-sdk-2.2
```

Check that installation worked:

```
dotnet --version
```

Should version should be 2.2.x

## 4.2 Monodevelop

```
sudo apt install apt-transport-https dirmngr  
sudo apt-key adv --keyserver hkp://keyserver.ubuntu.com:80 --recv-keys 3FA7E0328081BFF6A14DA29AA6A19B38D3D831EF  
echo "deb https://download.mono-project.com/repo/ubuntu vs-bionic main" | sudo tee /  
etc/apt/sources.list.d/mono-official-vs.list  
sudo apt update  
sudo apt-get install monodevelop
```

Usage: Navigate to project folder in terminal and run `monodevelop <some\_project>.csproj`

# CHAPTER 5

---

Balena

---

## 5.1 NVM

Balena CLI requires npm to install.

```
curl -sL https://raw.githubusercontent.com/creationix/nvm/v0.33.11/install.sh -o _  
↳install_nvm.sh  
bash install_nvm.sh  
source ~/.profile  
nvm install 10.16.0  
nvm alias default 10.16.0  
nvm use default
```

To get nvm working with sudo, use the following commands:

```
n=$(which node); \  
n=${n%/*}; \  
chmod -R 755 $n/bin/*; \  
sudo cp -r $n/{bin,lib,share} /usr/local
```

## 5.2 balena CLI

Installing

```
npm install balena-cli -g --production --unsafe-perm  
sudo npm install balena-cli -g --production --unsafe-perm
```

Logging in

```
balena login
```

For local mode development tips, use [this link](#).
