
OceanHeatFlux PDF analysis

Release 0.1.1

Nov 08, 2017

Contents

1	Contents	3
1.1	library usage	3
1.2	about	5
2	Reference API	7
2.1	lib.OHF_MFT_compute	7
3	Indices and tables	9

You can use this lib to compute distribution parameters (width, center and height) from air-sea heat fluxes timeseries

CHAPTER 1

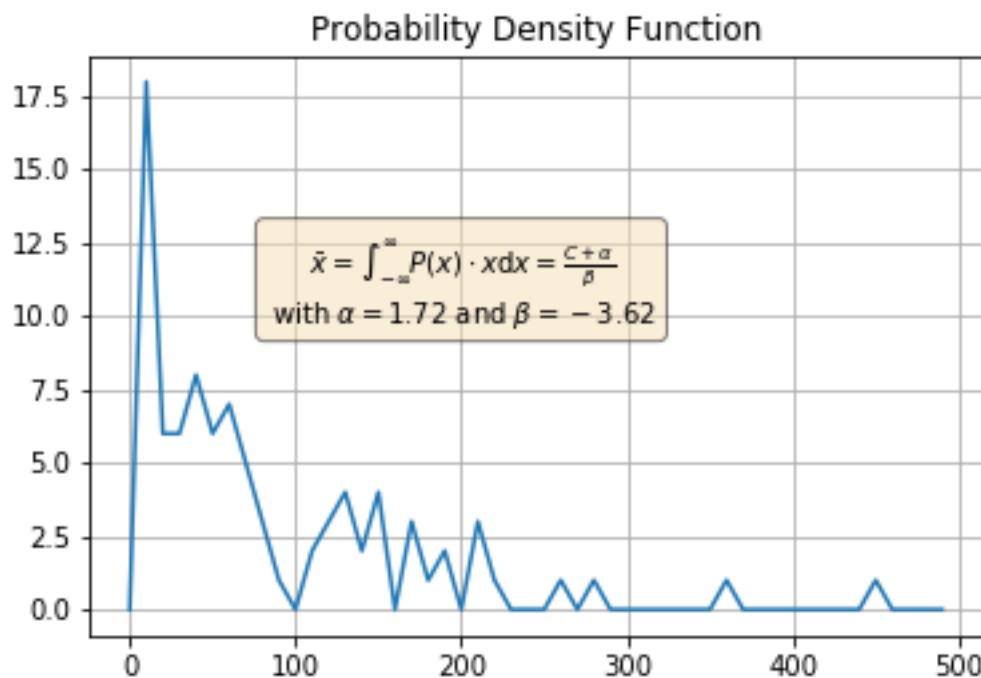

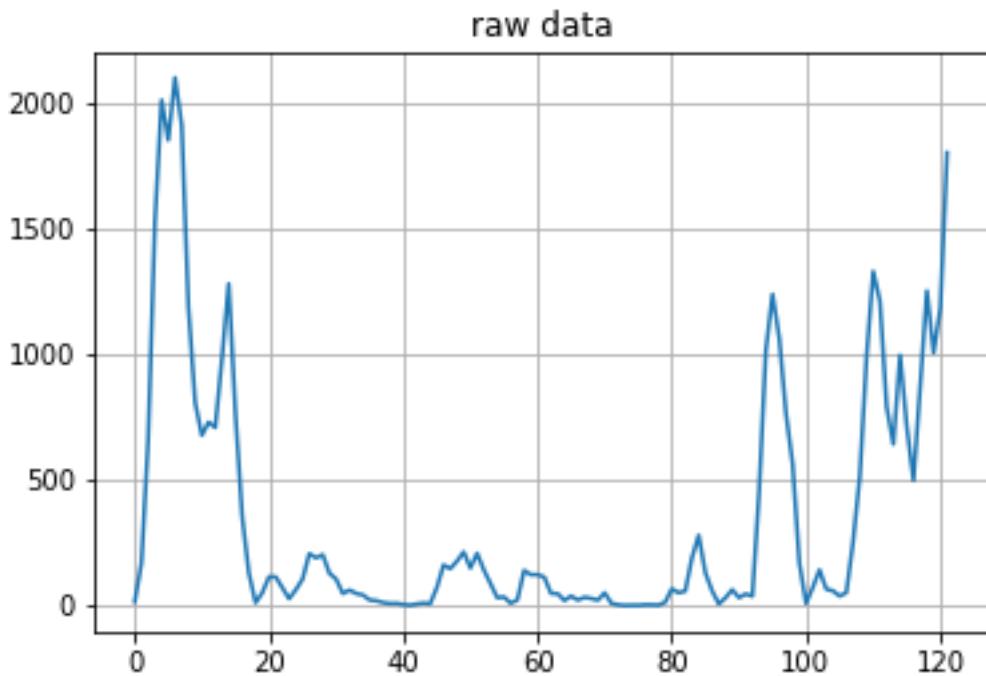

Contents

1.1 library usage

To use the method :MFT_compute: you can do like this:

```
from OHF_MFT_compute import MFT_compute
import logging
import numpy
tsfile = "../docs/static/Gulev_timeSerie_test.dat"
fid = open(tsfile)
tsdata = fid.readlines()
fid.close()
tsdata_num = []
tsdata_num = [float(x.replace('/', '')) for x in tsdata]
tsdata_num = numpy.array(tsdata_num)
resu = MFT_compute(tsdata_num, 'SULHF')
print "beta", resu['beta']
print 'apha', resu['alpha']
print resu.keys()
```

```
[out] beta -3.61935079661
[out] apha 1.7162575696
[out] ['binedges', 'dataPdf', 'xxx', 'dataCdf', 'hist', 'beta', 'alpha']
```

1.2 about

This library has been developed at IFREMER LOPS SIAM laboratory in the framework of OceanHeatFlux ESA project. <https://wwz.ifremer.fr/oceanheatflux/>

CHAPTER 2

Reference API

2.1 lib.OHF_MFT_compute

CHAPTER 3

Indices and tables

- genindex
- modindex
- search
