----------	---------------------------	----------

This is a small library that does basic Newton-cotes and MC integrations

`integrate.newton_cotes.simpson.evaluate(bounds, func)`
Evaluates simpsons rules on an array of values and a function pointer.

$$\int_a^b = \sum_i \dots$$

Parameters

- **bounds** (*array_like*) – An array with a dimension of two that contains the starting and ending points of the integrand.
- **func** (*function*) – Evaluate the integrand at a series of points.

Returns **integral** – The integral of the function between the bounds.

Return type float

CHAPTER 1

Indices and tables

- `genindex`
- `modindex`
- `search`

E

`evaluate()` (in module `integrate.newton_cotes.simpson`), 1
