
maggit Documentation

Release 0.1

Matthieu Gautier

January 07, 2016

1	Installing	3
1.1	Installing with pypi	3
1.2	Installing from source	3
2	Tutorial	5
2.1	Importing Maggit	5
2.2	Get a repository	5
2.3	References	5
2.4	Print the log of the 10th last commit of the master branch	6
2.5	Print the content of a file	6
2.6	The commit object	6
3	maggitt package api	7
3.1	maggitt.db package	7
3.2	maggitt.gitObjects module	15
3.3	maggitt.refs module	16
4	Indices and tables	17
	Python Module Index	19

Contents:

Installing

1.1 Installing with pypi

Maggit is available on pypi. Just use it

```
$ pip install maggit
```

1.2 Installing from source

You can directly download sources and install from them

```
$ git clone https://gitlab.com/maggit/maggit.git
$ cd maggit
$ python3 setup.py install .
```

To test that everything is ok

```
$ pip install pytest
$ py.test
```

You are now ready to use Maggit. Read the [Tutorial](#) if you don't know how.

2.1 Importing Maggit

This is pretty simple

```
import maggit
```

You can use the star import if you want

```
from maggit import *
```

For the rest of the tutorial, we'll assume that you import maggit and do not use the star import.

2.2 Get a repository

A *Repo* is one the central objects when interactig with maggit:

```
# Create a repository
repo = maggit.Repo()
```

By default, Maggit will look for a git repository in your current directory. If you want to explore a repository elsewhere, specify it:

```
repo = maggit.Repo("a/git/repository")
```

You don't have to specify a the root directory of the repository. If the directory you specify is not a git repository, maggit will look up in the parents directories.

2.3 References

Once we've got a repository, the first thing we may want to do is list it's references (branches, tags):

```
branches = repo.branches
print(repo.branches.keys())
```

repo.branches is a dictionnary mapping all branches of the repository

If we want manipulate the *master* branch, lets get it:

```
master = branches['master']
```

In the same way *repo.tags* is a dictionary mapping all tags of the repository

All the references we get, whatever they are branches, lightweight tag or real tag objects share a common api. The most interesting here, is to get the commit object pointed to by the ref:

```
commit = master.commit
```

2.4 Print the log of the 10th last commit of the master branch

We just have to go through the parent of the commit and print the message each time

```
commit = master.commit
for i in range(10):
    print(commit.message)
    commit = commit.parents[0]
```

2.5 Print the content of a file

There are several way of doing it.

The low level way is the following:

```
current = commit.tree
for part in path.split(b'/'):
    current = current.entries[part]
blob = current
print(blob.content)
```

But you can also use a high level api

```
entry = maggit.Entry(commit, path)
# the entry is a intermediate object making the link between a gitobject
# and a particular commit
blob = entry.gitObject
print(blob.content)
```

2.6 The commit object

Other important object in Maggit is naturally the git objects. A git object firstly allow us to access to the content of the object itself.

The commit object is one of them. Naturally it allows us to access the commit attributes:

```
commit.message
commit.first_line #The first line of the message
commit.author
commit.committer
commit.parents # The parents of the commit
commit.tree # The tree object
```

maggit package api

3.1 maggit.db package

This module contains all the low level classes to handle a git repository.

Class defined in this module use io functions and provide a more consistant API to access content of the git repository.

Most users will not use those object directly but better use the high level API provided by the maggit package itself.

3.1.1 maggit.db.io package

This module contains all the low level functions necessary to Maggit to read, write and parse all git files.

Thoses files includes git objects, pack, packedrefs, config, index, ...

Thoses function do not provide high level API. There are mainly intended to be use by Maggit itself.

maggit.db.io.loose module

`maggit.db.io.loose.commit_parse` (*content*)

Parse a commit content.

Parameters `content` (*bytes*) – The content to parse (without header).

Returns

A tuple (tree, parents, message, author, committer) where:

- tree is the sha of the tree object of the commit(unhexlified bytes).
- parents is a list of sha of the parents commit.
- message is the message of the commit.
- author is the name (b'name <email> timestamp') of the author.
- author is the name (b'name <email> timestamp') of the committer.

Return type bytes, list[bytes], bytes, bytes, bytes

`maggit.db.io.loose.object_content` (*filepath*)

Return the content of a loose object.

Parameters `filepath` – The path of the loose object.

Returns

A tuple (type, content) where:

- **type** is the type of the object.
- **content** is the content of the object (without header).

Return type bytes, bytes

`maggit.db.io.loose.object_rawsha (type_, content)`

Generate the raw content and the sha of a object content.

Parameters

- **type** (*bytes*) – The type of the object.
- **content** (*bytes*) – The content of the object (without header).

Returns

A tuple (raw, sha) where:

- **raw** is the full content of the object (with header).
- **sha** is the sha of the object.

Return type bytes, bytes

`maggit.db.io.loose.object_sha (type_, content)`

Generate the sha of a object content.

Is the bit more performant than `object_rawsha(...)[1]` as the raw content is not generated.

Parameters

- **type** (*bytes*) – The type of the object.
- **content** (*bytes*) – The content of the object (without header).

Returns The sha of the object.

`maggit.db.io.loose.object_sha_from_raw (raw)`

Generate the sha of a object from its content.

Parameters **raw** (*bytes*) – The content of the object (with header)

Returns The sha of the object.

`maggit.db.io.loose.object_write (filepath, content, compress_level=1)`

Correctly create the loose object file.

Parameters

- **filepath** – The path of the loose object to write.
- **content** (*bytes*) – The full content (with header) to write.
- **compress_level** (*int*) – The compression level to use (default=1).

`maggit.db.io.loose.tag_parse (content)`

Parse a tag content.

Parameters **content** (*bytes*) – The content to parse (without header).

Returns

A tuple (object, objecttype, tag, tagger, message) where:

- **object** is the sha of the tagged object (unhexlified bytes).

- `objecttype` is the type of the tagged object.
- `tag` is the name of the tag.
- `tagger` is the name (b'name <email> timestamp') of the tagger.
- `message` is the message of the tag.

Return type bytes, bytes, bytes, bytes, bytes

maggit.db.io.pack module

class `maggit.db.io.pack.GitPack(packfile, idxfile)`

A git pack file.

Parameters

- **packfile** (*path*) – The path of the packfile.
- **idxfile** (`GitPackIndex`) – The index associated to the pack.

read_object (*offset*)

Return the content of a object at a offset.

Parameters **offset** – The offset to read from.

Returns

A tuple (type, content) where:

- `type` is the type of the object.
- `content` is the content of the object (without header).

Return type bytes, bytes

class `maggit.db.io.pack.GitPackIndex(indexfile)`

A pack index

Parameters **indexfile** (*path*) – The path of the index file.

get_offset (*sha*)

Return the offset in the pack associated to the sha.

maggit.db.io.packedref module

`maggit.db.io.packedref.packed_ref_parse(filename)`

Parse a packed ref file.

Parameters **filename** (*path*) – The path of the packed ref.

Returns

A list of (ref, sha, peeledsha) where:

- `ref` is name of the ref
- `sha` is the associated sha
- `peeledsha` is the peeled sha associated to the ref if present. Else None.

Return type List[Tuple[bytes, bytes, bytes]]

3.1.2 maggit.db.db module

class `maggit.db.db.Gitdb(rootdir)`

Bases: `object`

The Gitdb, unify all loose/pack io function to provide a coherent access to content of a git repository.

A Gitdb handle only the reading of git objects. Not the references, remotes, ...

Parameters `rootdir` (*path*) – The path of the objects directory (.git/objects)

blob_content (*sha*)

Read and parse a object assuming it is a blob.

Parameters `sha` – The sha of the object.

Returns The content of the blob (bytes).

Raises `ValueError` – If the object is not a blob.

blob_write (*content*)

commit_content (*sha*)

Read and parse a object assuming it is a commit.

Parameters `sha` – The sha of the object.

Returns

A tuple (tree, parents, message, author, committer) where:

- tree is the sha of the tree object of the commit(unhexlified bytes).
- parents is a list of sha of the parents commit.
- message is the message of the commit.
- author is the name (b'name <email> timestamp') of the author.
- author is the name (b'name <email> timestamp') of the committer.

Return type bytes, list[bytes], bytes, bytes, bytes

Raises `ValueError` – If the object is not a commit.

commit_write (*tree*sha, *message*, *author*, *authorDate*, *committer*, *committerDate*, *parents*=[])

gen_pack_list ()

get_full_sha (*prefix*)

Return the full Sha of the prefix

Parameters `prefix` (*bytes*) – The beginning of a sha.

Returns The corresponding (bytes).

Exemples:

```
>>> repo.get_full_sha(b'bf09f0a9')
<Sha b'bf09f0a9...'>
```

Raises :`Exception` – If number of object corresponding to prefix is not equal to one.

get_pack (*sha*)

Get a pack containing the sha

Parameters *sha* – The sha of the object

Returns *class:~maggit.io.pack.GitPack* containing the sha

Return type The

object_content (*sha*)

object_exists (*sha*)

Return True if the sha exists in the db

object_type (*sha*)

Return the type of the object associated to sha.

Parameters *sha* – The sha of the object.

Returns The type of the object.

tag_content (*sha*)

Read and parse a object assuming it is a tag.

Parameters *sha* – The sha of the object.

Returns

A tuple (object, objecttype, tag, tagger, message) where:

- object is the sha of the tagged object (unhexlified bytes).
- objecttype is the type of the tagged object.
- tag is the name of the tag.
- tagger is the name (b'name <email> timestamp') of the tagger.
- message is the message of the tag.

Return type bytes, bytes, bytes, bytes, bytes

Raises *ValueError* – If the object is not a tag.

tag_write (*objectsha, tag, tagger, tagDate, message*)

tree_content (*sha*)

Read and parse a object assuming it is a tree.

Parameters *sha* – The sha of the object.

Returns

A list of (path, (mode, sha)) where :

- path is the name of the entry.
- mode is the git mode.
- sha is the sha of the blob/tree object.

Return type List[Tuple[bytes, Tuple[bytes, bytes]]]

Raises *ValueError* – If the object is not a tree.

tree_write (*entries*)

3.1.3 maggit.db.repo module

class `maggit.db.repo.Repo` (*gitdir=None, disable_directoryLooking=False, bare=False*)

This is the low level Repository class.

The repo make the link between all other low level subsystems and recreate a coherent database.

Parameters

- **gitdir** (*path*) – The directory path of the repository,
If is None, the current working directory is assumed.
- **disable_directoryLooking** (*bool*) – If True, assume that the gitdir is a valid path
so do not search for a valid git repository in parents and gitdir must not be None.
- **bare** (*bool*) – Does the repository is a bare one. Only relevant if `disable_directoryLooking`
is True. Else, the bare attribute is detected from the git repository structure.

classmethod `get_git_dir` (*dirToCheck=None*)

classmethod `init_repo` (*gitdir, bare=False*)

Instantiate a new git repo at the given location.

class `maggit.Sha`

Bases: `bytes`

A Sha is a git sha. It means that it is the identifier of a git object.

Sha are store in Maggit as a 20 bytes len.

hexbytes

The sha as a hexlified bytes

hexstr

The sha as a hexlified str

class `maggit.Repo` (*gitdir=None, disable_directoryLooking=False, bare=False*)

Bases: `maggit.db.repo.Repo`

This is the central piece of a git repository.

HEAD

The current checkoutted branch

branches

A dict of branches in the repo

get_full_sha (*prefix*)

Return the full Sha of the prefix

Parameters **prefix** (*bytes*) – The beginning of a sha.

Returns `class:~maggit.Sha` corresponding.

Return type The

Exemples:

```
>>> repo.get_full_sha(b'bf09f0a9')
<Sha b'bf09f0a9...'>
```

Raises :`Exception` – If number of object corresponding to prefix is not equal to one.

get_git_dir (*dirToCheck=None*)

get_object (*sha*)

Get a git object for the sha.

Parameters *sha* (*Sha*) – The sha of the object.

Returns class:~maggit.gitObjects.GitObject object for this sha.

Return type A

Raises :Exception – If sha doesn't name a object.

init_repo (*gitdir, bare=False*)

Instantiate a new git repo at the given location.

tags

A dict of tags in the repo

class maggit.**Person** (*name, email*)

class maggit.**Entry** (*commit, path*)

A Entry represent a entry (file or directory) at a specific time.

We can somehow see a repository as a complex 2 dimentionnal array. Commits (and so the history) are rows. Files (and Trees) are columns.

In this situations, Entry are the cells of this array.

Parameters

- **commit** (*maggit.Commit*) – The commit associated to the Entry
- **path** (*bytes path*) – The path of the file to look at. The path must be a bytes where directory are separated by b'/'.

Raise: KeyError if the path is not existing.

get_first_appearance ()

Return the commit who firstly introduce the current version of the change.

Returns class:maggit.Commit

Return type A

Exemples:

```
>>> first_appearance_commit = this_entry.get_first_appearance()
>>> # first_appearance_commit is the first one, so previous version differs
>>> parent = first_appearance_commit.parents[0]
>>> assert Entry(first_appearance_commit, this_entry.path).gitObject != Entry(parent, th
>>> # from this_commit to first_appearance_commit, there is no change
>>> current = this_entry.commit
>>> while current != first_appearance_commit:
...     assert Entry(current, this_entry.path).gitObject == this_entry.gitObject
...     current = current.parents[0]
```

is_blob ()

Return True if the entry is corresponding to a blob object

parents

The previous versions of the files.

Previous versions can be equal to the current one if the current commit introduce no change on this file.

The length of the parents will most of the time be 1 but may be greater in case of merge.

class `maggit.Blob(repo, sha)`

Bases: `maggit.gitObjects.gitObject.GitObject`

A blob object.

content

bytes

This is the content of the blob.

class `maggit.Tree(repo, sha)`

Bases: `maggit.gitObjects.gitObject.GitObject`

A blob object.

entries

immutable mapping

This is the entries of the tree.

class `maggit.Commit(repo, sha)`

Bases: `maggit.gitObjects.gitObject.GitObject`

A commit object.

tree

Tree

The tree object associated with the commit.

parents

tuple

The parents of the commits. Most of the time, there will only one parent. In case of branch merge, there will be more than one parent.

author

Person

The author of the commit.

author_date

timedate

When the commit was created.

committer

Person

The committer of the commit.

committer_date

timedate

When the commit was committed.

first_line

str

The first line of the commit message.

message

str

The full commit message (including the first line).

class `maggit.Tag(repo, sha)`

Bases: `maggit.gitObjects.gitObject.GitObject`

A tag object.

object

GitObject

The git object tagged by this tag.

tag

str

The name of the tag.

tagger

Person

The person who create the tag.

tagger_date

timedate

When the tag was created.

first_line

str

The first line of the tag message.

message

str

The full tag message (including the first line).

3.2 maggit.gitObjects module

class `maggit.gitObjects.GitObject(repo, sha)`

The base class for all git objects.

Git objects are conceptually constant. However as we try to be lazy, slots are not fill at object creation and set when user read it. So `GitObject` are not constant but behave as if they were.

repo

Repo

The repo associated with the object.

sha

Sha

The sha of the object.

3.3 maggit.refs module

```
class maggit.refs.Ref(repo, sha)
    Bases: maggit.refs.BaseRef
        commit
        repo
        sha

class maggit.refs.Branche(repo, branchName)
    Bases: maggit.refs.BaseRef
        commit
        name
        repo
        sha

class maggit.refs.Tag(repo, tagName)
    Bases: maggit.refs.BaseRef
        commit
        name
        object
        repo
        sha
```

Indices and tables

- `genindex`
- `modindex`
- `search`

A

author (Commit attribute), 14
author_date (Commit attribute), 14

B

Blob (class in maggit), 14
blob_content() (maggit.db.db.Gitdb method), 10
blob_write() (maggit.db.db.Gitdb method), 10
Branche (class in maggit.refs), 16
branches (maggit.Repo attribute), 12

C

Commit (class in maggit), 14
commit (maggit.refs.Branche attribute), 16
commit (maggit.refs.Ref attribute), 16
commit (maggit.refs.Tag attribute), 16
commit_content() (maggit.db.db.Gitdb method), 10
commit_parse() (in module maggit.db.io.loose), 7
commit_write() (maggit.db.db.Gitdb method), 10
committer (Commit attribute), 14
committer_date (Commit attribute), 14
content (Blob attribute), 14

E

entries (Tree attribute), 14
Entry (class in maggit), 13

F

first_line (Commit attribute), 14
first_line (Tag attribute), 15

G

gen_pack_list() (maggit.db.db.Gitdb method), 10
get_first_appearance() (maggit.Entry method), 13
get_full_sha() (maggit.db.db.Gitdb method), 10
get_full_sha() (maggit.Repo method), 12
get_git_dir() (maggit.db.repo.Repo class method), 12
get_git_dir() (maggit.Repo method), 12
get_object() (maggit.Repo method), 13
get_offset() (maggit.db.io.pack.GitPackIndex method), 9

get_pack() (maggit.db.db.Gitdb method), 10
Gitdb (class in maggit.db.db), 10
GitObject (class in maggit.gitObjects), 15
GitPack (class in maggit.db.io.pack), 9
GitPackIndex (class in maggit.db.io.pack), 9

H

HEAD (maggit.Repo attribute), 12
hexbytes (maggit.Sha attribute), 12
hexstr (maggit.Sha attribute), 12

I

init_repo() (maggit.db.repo.Repo class method), 12
init_repo() (maggit.Repo method), 13
is_blob() (maggit.Entry method), 13

M

maggit.db (module), 7
maggit.db.db (module), 10
maggit.db.io (module), 7
maggit.db.io.loose (module), 7
maggit.db.io.pack (module), 9
maggit.db.io.packedref (module), 9
maggit.db.repo (module), 12
maggit.gitObjects (module), 15
maggit.refs (module), 16
message (Commit attribute), 14
message (Tag attribute), 15

N

name (maggit.refs.Branche attribute), 16
name (maggit.refs.Tag attribute), 16

O

object (maggit.refs.Tag attribute), 16
object (Tag attribute), 15
object_content() (in module maggit.db.io.loose), 7
object_content() (maggit.db.db.Gitdb method), 11
object_exists() (maggit.db.db.Gitdb method), 11
object_rawsha() (in module maggit.db.io.loose), 8

`object_sha()` (in module `maggit.db.io.loose`), 8
`object_sha_from_raw()` (in module `maggit.db.io.loose`), 8
`object_type()` (`maggit.db.db.Gitdb` method), 11
`object_write()` (in module `maggit.db.io.loose`), 8

P

`packed_ref_parse()` (in module `maggit.db.io.packedref`), 9
`parents` (`Commit` attribute), 14
`parents` (`maggit.Entry` attribute), 13
`Person` (class in `maggit`), 13

R

`read_object()` (`maggit.db.io.pack.GitPack` method), 9
`Ref` (class in `maggit.refs`), 16
`Repo` (class in `maggit`), 12
`Repo` (class in `maggit.db.repo`), 12
`repo` (`maggit.gitObjects.GitObject` attribute), 15
`repo` (`maggit.refs.Branche` attribute), 16
`repo` (`maggit.refs.Ref` attribute), 16
`repo` (`maggit.refs.Tag` attribute), 16

S

`Sha` (class in `maggit`), 12
`sha` (`maggit.gitObjects.GitObject` attribute), 15
`sha` (`maggit.refs.Branche` attribute), 16
`sha` (`maggit.refs.Ref` attribute), 16
`sha` (`maggit.refs.Tag` attribute), 16

T

`Tag` (class in `maggit`), 15
`Tag` (class in `maggit.refs`), 16
`tag` (`Tag` attribute), 15
`tag_content()` (`maggit.db.db.Gitdb` method), 11
`tag_parse()` (in module `maggit.db.io.loose`), 8
`tag_write()` (`maggit.db.db.Gitdb` method), 11
`tager` (`Tag` attribute), 15
`tager_date` (`Tag` attribute), 15
`tags` (`maggit.Repo` attribute), 13
`Tree` (class in `maggit`), 14
`tree` (`Commit` attribute), 14
`tree_content()` (`maggit.db.db.Gitdb` method), 11
`tree_write()` (`maggit.db.db.Gitdb` method), 11
