# FQC Documentation

*Release 3*

**Joe Brown**

**Mar 02, 2018**

---

## Getting Started

---

<b>1</b>	<b>Example Site</b>	<b>3</b>
<b>2</b>	<b>Citation</b>	<b>5</b>
2.1	Install . . . . .	5
2.2	Example Workflow . . . . .	6
2.3	Groups . . . . .	11
2.4	Configuration File . . . . .	12
2.5	Plot Tabs . . . . .	13
2.6	Area Range . . . . .	13
2.7	Bar . . . . .	16
2.8	Heatmap . . . . .	18
2.9	Histogram . . . . .	20
2.10	Line . . . . .	22
2.11	Plate Heatmap . . . . .	25
2.12	Table . . . . .	27

FQC is designed to better group FastQC result data across groups where each group is comprised of FASTQs related to an experiment or sequencing batch. Individual samples are grouped into paired-end sets when available and the dashboard's extensibility allows a user to add plots or tables as desired.

# CHAPTER 1

---

## Example Site

## Citation

---

Joseph Brown, Meg Pirrung, Lee Ann McCue; FQC Dashboard: integrates FastQC results into a web-based, interactive, and extensible FASTQ quality control tool. Bioinformatics 2017 doi: [10.1093/bioinformatics/btx373](https://doi.org/10.1093/bioinformatics/btx373)

## 2.1 Install

### 2.1.1 Requires

Parsing the table and running FastQC is performed with code written for Python 3. We recommend using Anaconda (<https://www.continuum.io/downloads>) to install the FastQC dependency.

#### Set Up BIOCONDA channels

```
conda config --add channels conda-forge  
conda config --add channels defaults  
conda config --add channels bioconda
```

#### Install Dependency

```
conda install fastqc
```

### 2.1.2 Install

The dashboard reads local files, so install where you will eventually be serving the site:

```
git clone https://github.com/pnnl/fqc.git  
cd fqc  
python setup.py install
```

This installs `fqc` command-line tool to process FASTQs and create the dashboard.

Then to deploy a local copy from within the `fqc` directory, you can run:

```
python -m http.server --bind localhost 8000
```

And navigate to `localhost:8000` in your browser.

By default, this will show the test data QC as determined by the data directory in `js/fqc.js`:

```
var filePath = "/example/plot_data/"
```

Edit `fqc.js` to your local path **within** the `fqc` directory tree.

## 2.2 Example Workflow

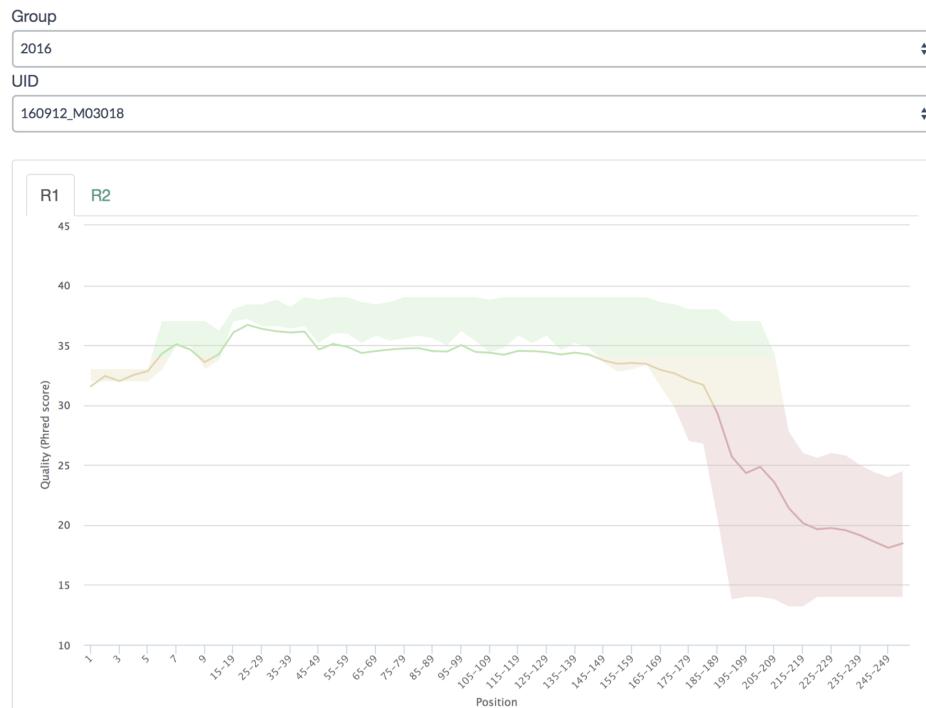

Using the example data set provided in the repo, let's walk through creating the example site with paired-end data and some custom plots.

In our example, we're looking at highly replicated 16S amplicon data, so we will be omitting non-informative plots from our display using `--exclude`.

### 2.2.1 Running QC

After installation, run QC over the first sample and generate the dashboard from within `fqc` repository:

```
$ cd example
$ fqc qc -t 8 -e 'Basic Statistics' \
    -e 'Overrepresented Sequences' \
    -e 'Count by Length' \
    -e 'Kmer Content' \
    2016_160912_M03018 data/fastqs/160912_M03018_R1.fastq.gz
```

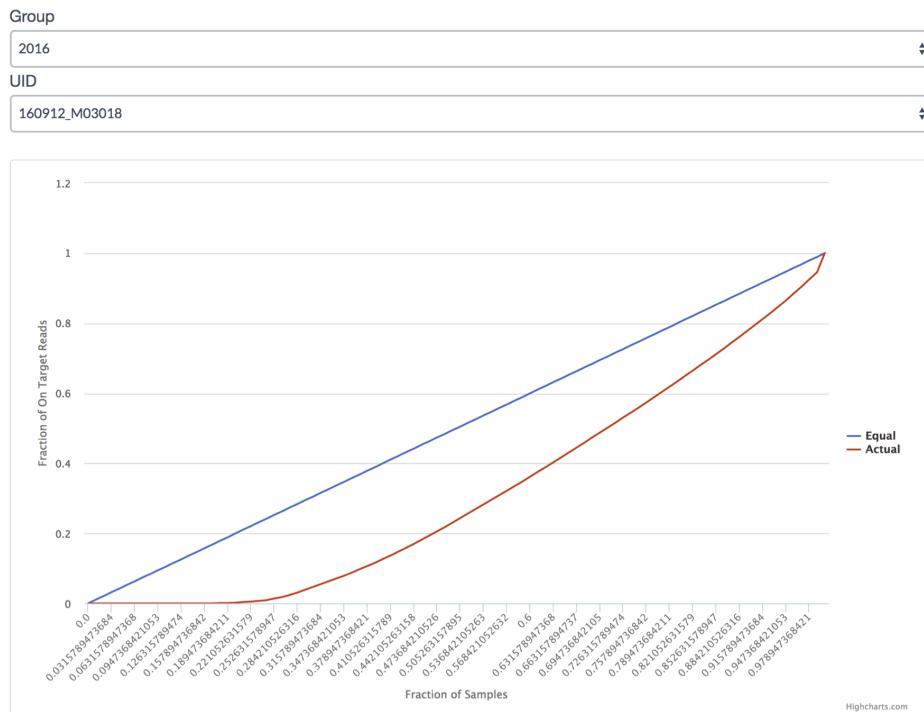

## 2.2.2 Adding Custom Plots

Next, add the Lorenz curve which gives us an idea of how equitably the sequences were distributed among barcodes. This plot will be added as the top tab using `--prepend`:

```
$ fqc add --prepend --x-value FractionOfSamples --y-value Equal \
    --y-value Actual --x-label 'Fraction of Samples' \
    --y-label 'Fraction of On Target Reads' \
    plot_data/2016/160912_M03018/config.json \
    'Read Distribution' \
    line \
    data/tables/160912_lorenz.csv
```

The JSON entry in the output above is just for confirmation as it has already been added to this run's configuration.

Our display now shows the new tab in the first position:

**Tip:** Based on the distribution of barcodes, the user could have specified a fail or warning condition on using the Gini Coefficient and set a tab icon using `--status fail` in the previous command. For more information see [Tab Status](#).

To add the sequence summary table, we need to append another tab:

```
$ fqc add --prepend \
    plot_data/2016/160912_M03018/config.json \
    'Run Stats' \
    table \
    data/tables/160912_summary.csv
```

Group  
2016

UID  
160912\_M03018

Measure	Value
Coefficient of Distribution (G)	0.260394791718
Fraction Off Target	1.0284348916e-05
Fraction On Target	0.67042235853
Fraction Unmatched	0.329567357121
Total Reads	15752091

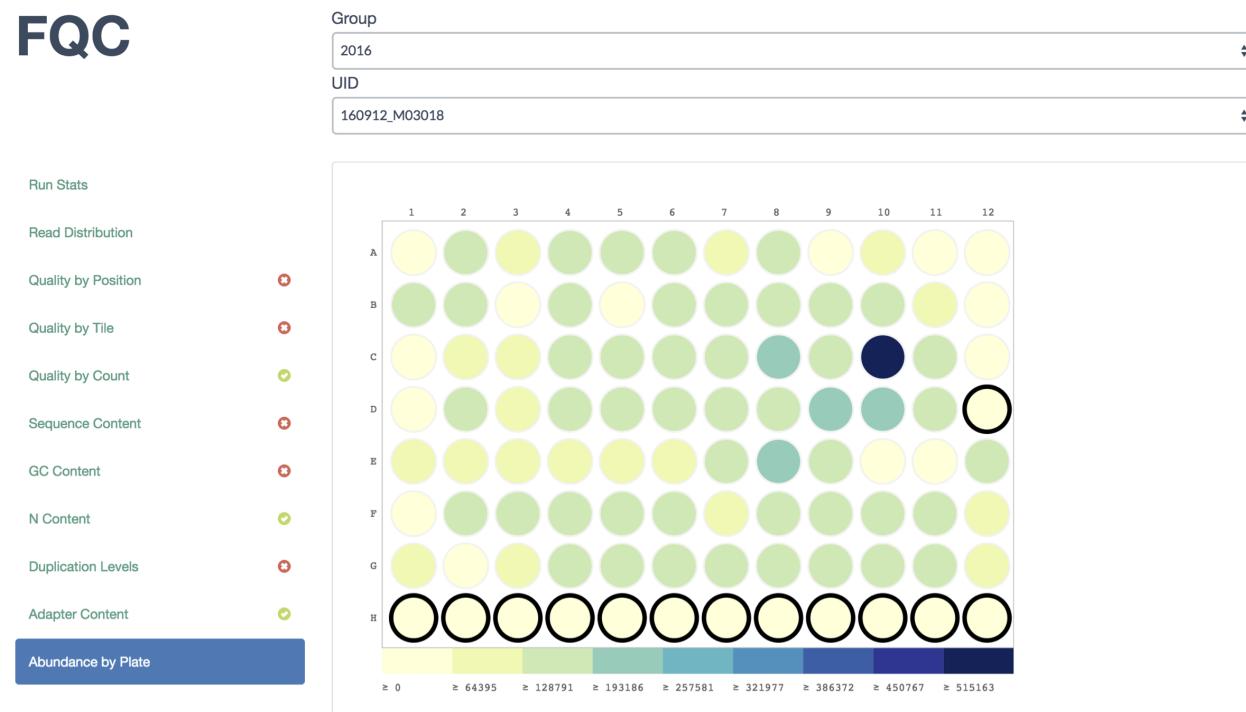

Showing 1 to 5 of 5 entries

[Previous](#) 1 [Next](#)

Another plot we typically add shows read abundance across primer plates. This is valuable to observe positive and negative control wells in addition to seeing the effects on neighboring wells. Run 160912 did not have any controls, so we'll just add abundance for its plate:

```
$ fqc add --x-value WELL_COL --y-value WELL_ROW \
    --value TOTAL_PAIRED_READS --label LABEL --colors 'UNUSED:#000000' \
    plot_data/2016/160912_M03018/config.json \
    'Abundance by Plate' \
    plateheatmap \
    data/tables/160912_plate_1.csv
```

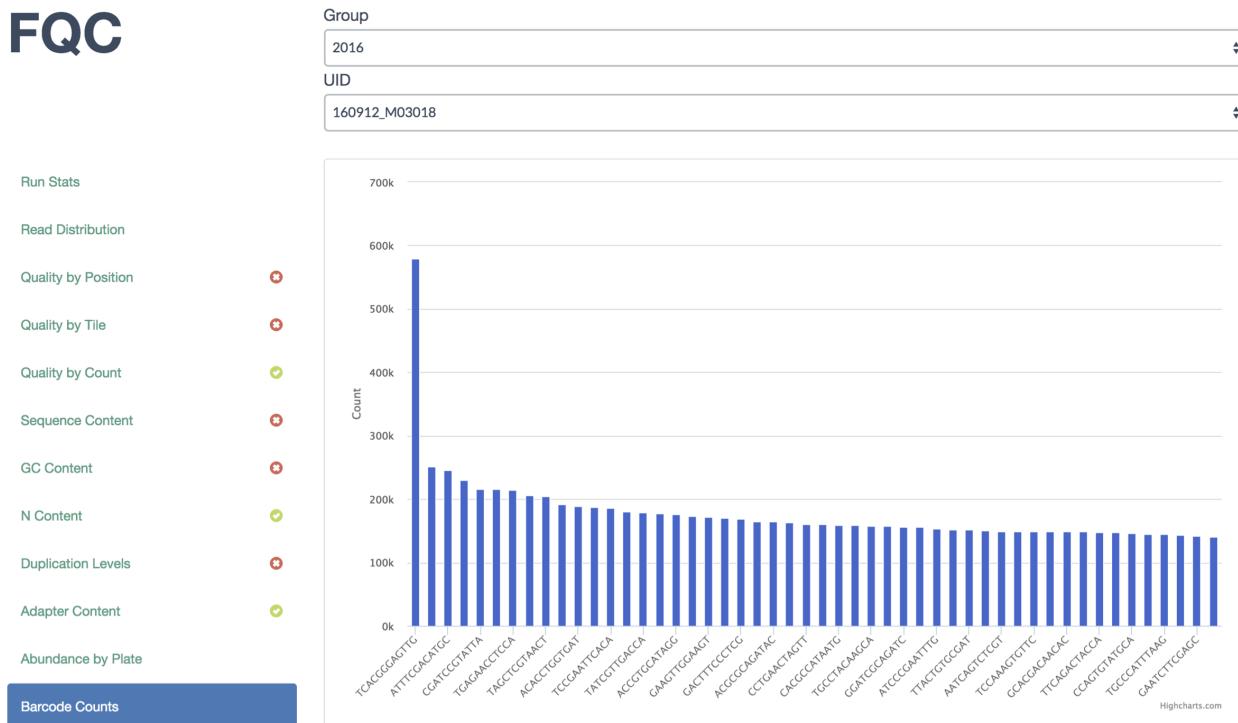

# FQC

And finally, sometimes things go wrong and barcode plates get mixed up, so we display the top barcodes and their counts. Usually we simply add it as a table, but lets display it as a bar plot:

```
$ fqc add --x-value Barcode --y-value Count \
    plot_data/2016/160912_M03018/config.json \
    "Barcode Counts" \
    bar \
    data/tables/160912_top50barcodes.csv
```

# FQC

The remainder of the example site iterates over these steps for the remainder of the samples.

## 2.3 Groups

Located within the `plot_data` directory, this holds metadata for each group and samples within the groups:

```
[
  {
    "group_id": "group_01",
    "uids": [
      "test_01"
    ]
  },
  {
    "group_id": "group_00",
    "uids": [
      "test_00"
    ]
  }
]
```

Renders as:

The sample ID and group ID must match the underlying directory tree that is built by `fqc qc` and maintained when using `fqc batch-qc` and `fqc add`.

The directory tree of this simple example:

```
plot_data/
└── group_00
    └── test_00
        ├── R1
        ├── R2
        └── config.json
    └── group_01
        └── test_01
            ├── R1
            ├── R2
            └── config.json
└── groups.json
```

For a more detailed example, see the `groups.json` file located in the example data directory.

## 2.4 Configuration File

Each FASTQ or FASTQ pair will have an associated `config.json` file that holds information like which plots to draw into which tabs and where the associated data files reside. Each entry must have a `tab_name`, `filename, and `chart_properties` specific to the chart type. For more information on individual plots and their requirements, see their respective pages.

### 2.4.1 Tab Status

This is an optional icon for page tabs and supports values of `pass`, `fail`, or `warn`. It's rendered as:

Basic Statistics	✓
Quality by Position	✗
Quality by Tile	?

### 2.4.2 Plot Options

The configuration of plots themselves occurs within the `chart_properties` key. Individual plot options are defined in the docs under each plot type.

### 2.4.3 Manual Editing

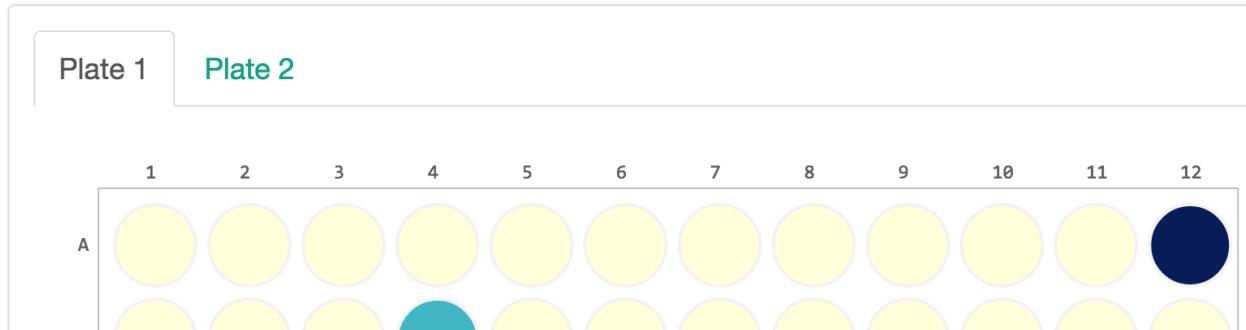

Plots can edited and plot data can be added manually to a particular sample's `config.json`. If you're adding a new sample manually, you will have to add it to `groups.json`.

## 2.5 Plot Tabs

Tabs can be added to the plot area using a list of lists for the `filename` attribute. The first position is the name of the tab while the second is the file path. An example JSON entry for this in a sample's `config.json` looks like:

```
"filename": [
    [
        "Plate 1",
        "plt1_counts.csv"
    ],
    [
        "Plate 2",
        "plt2_counts.csv"
    ]
]
```

Which will render as:

## 2.6 Area Range

The area range plot is automatically generated from FastQC output for inspecting read quality as a function of position along the sequence.

### 2.6.1 Example Data

An example table after parsing output from FastQC looks like:

Base	Mean	Lower Quartile	Upper Quartile
1	32.193	32.0	33.0
2	32.365	32.0	33.0
3	32.570	32.0	33.0

## 2.6.2 Plot Options

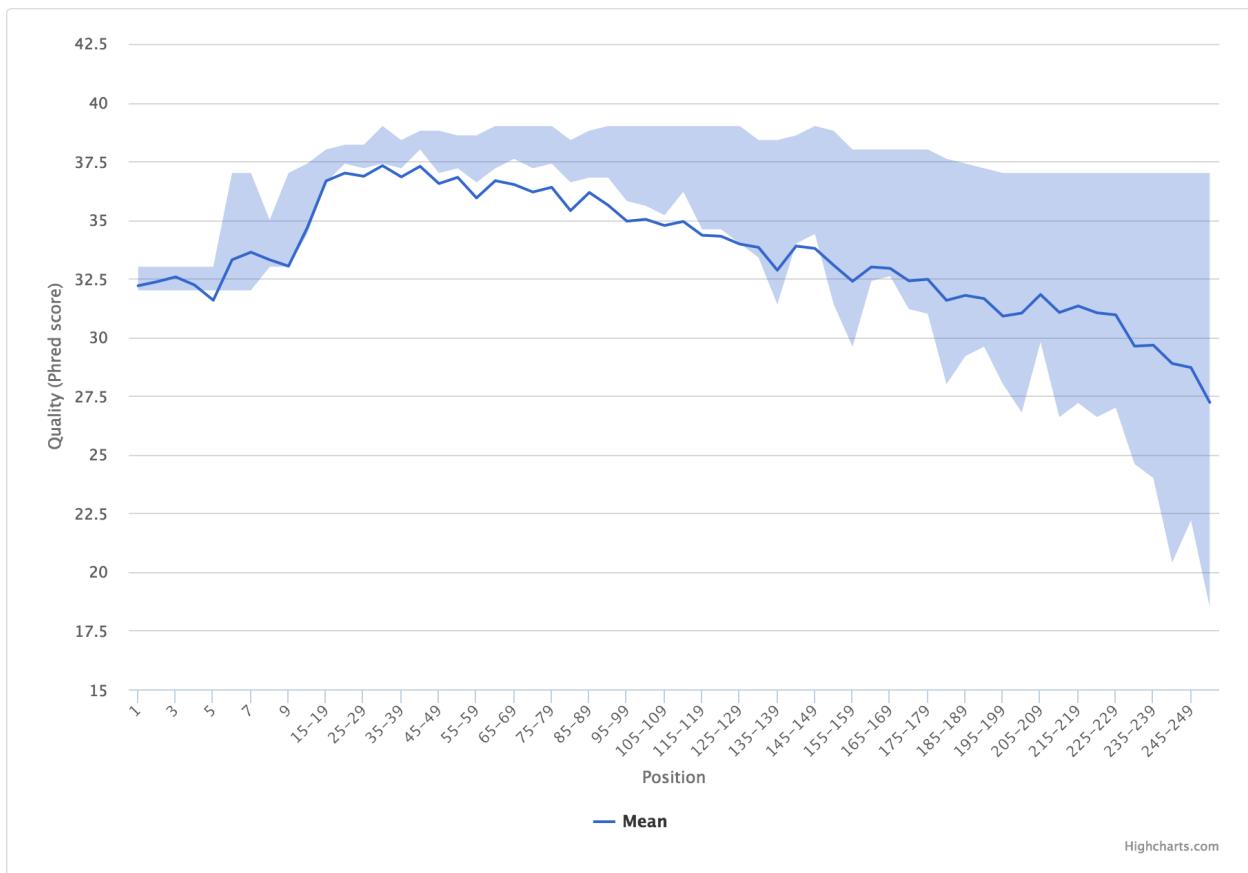

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

## 2.6.3 Chart Properties

Option	Value
type	the required entry is ‘arearange’
x_label	x-axis label
x_value	the header label defined in filename corresponding to x-values
y_label	y-axis label
lower_quartile	the header label defined in filename corresponding to lower quartile values
upper_quartile	the header label defined in filename corresponding to upper quartile values
mean	the header label defined in filename corresponding to mean values
zones	defined as ‘value’:‘color’ with an initial ‘color’ as the base; see example below

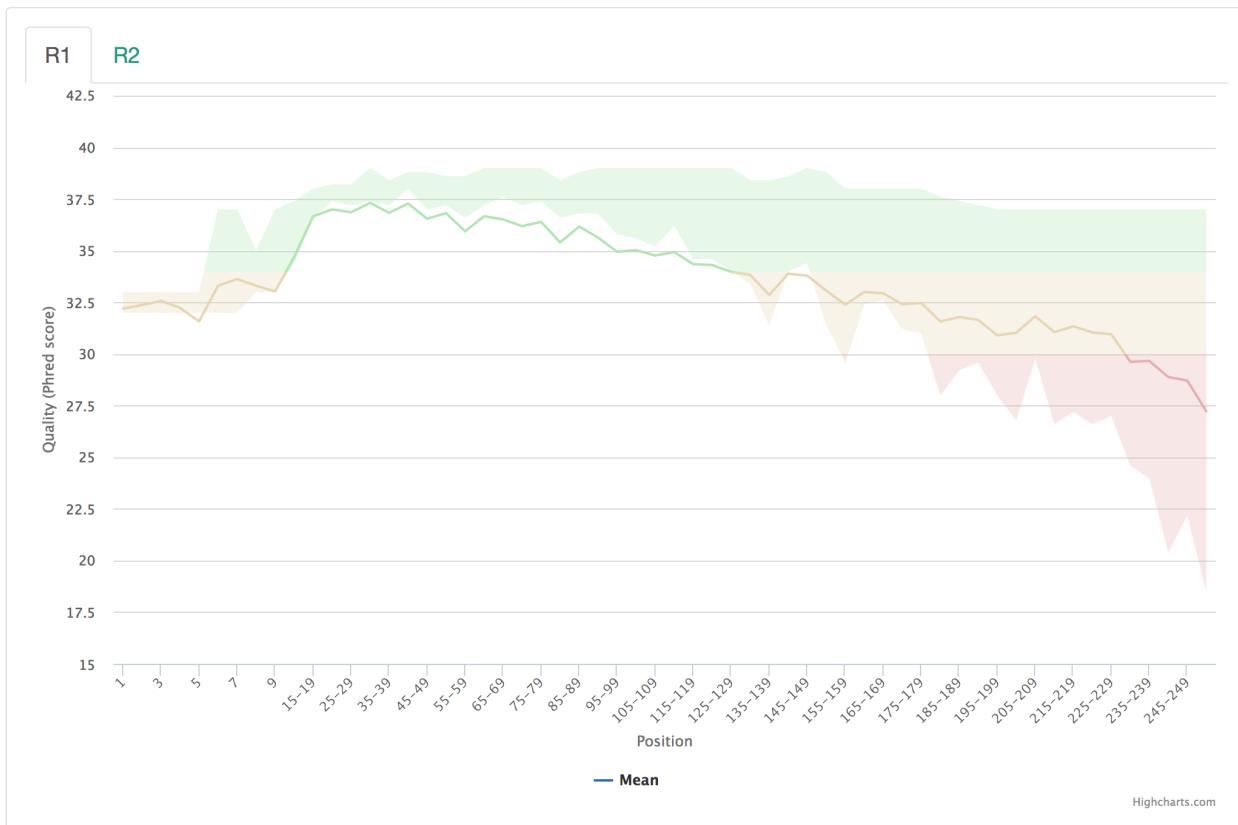

Example JSON entry:

```
{
    "filename": "R1/Per_base_sequence_quality.csv",
    "tab_name": "Quality by Position",
    "status": "pass",
    "chart_properties": {
        "type": "arearange",
        "x_label": "Position",
        "x_value": "Base",
        "y_label": "Quality (Phred score)",
        "lower_quartile": "Lower Quartile",
        "upper_quartile": "Upper Quartile",
        "mean": "Mean"
    }
}
```

There is support for adding zones as well, if you're going for the classic FastQC look and feel:

```
{
  "filename": [
    ["R1", "R1/Per_base_sequence_quality.csv"],
    ["R2", "R2/Per_base_sequence_quality.csv"]
  ],
  "tab_name": "Quality by Position",
  "status": "warn",
  "chart_properties": {
    "type": "arearange",
    "x_label": "Position",
    "x_value": "Base",
    "y_label": "Quality (Phred score)",
    "lower_quartile": "Lower Quartile",
    "upper_quartile": "Upper Quartile",
    "mean": "Mean",
    "zones": [
      {"value": 30, "color": "#e5afb0"},
      {"value": 34, "color": "#e6d6b1"},
      {"color": "#b0e5b1"}
    ]
  }
}
```

## 2.7 Bar

No bar plots are automatically generated from FastQC output, but can optionally be added for custom data tables.

### 2.7.1 Example Data

Barcode	Count
TCACGGGAGTTG	579558
AGTCAGACGCT	250808
ATTCGACATGC	245063
TAATGACCACGC	230339
CGATCCGTATTA	215466

### 2.7.2 Usage to Add

Given the example data for barcode counts:

```
$ fqc add --x-value Barcode --y-value Count \
  plot_data/2016/160912_M03018/config.json \
  "Barcode Counts" \
  bar \
  example/data/tables/160912_top50barcodes.csv
```

### 2.7.3 Plot Options

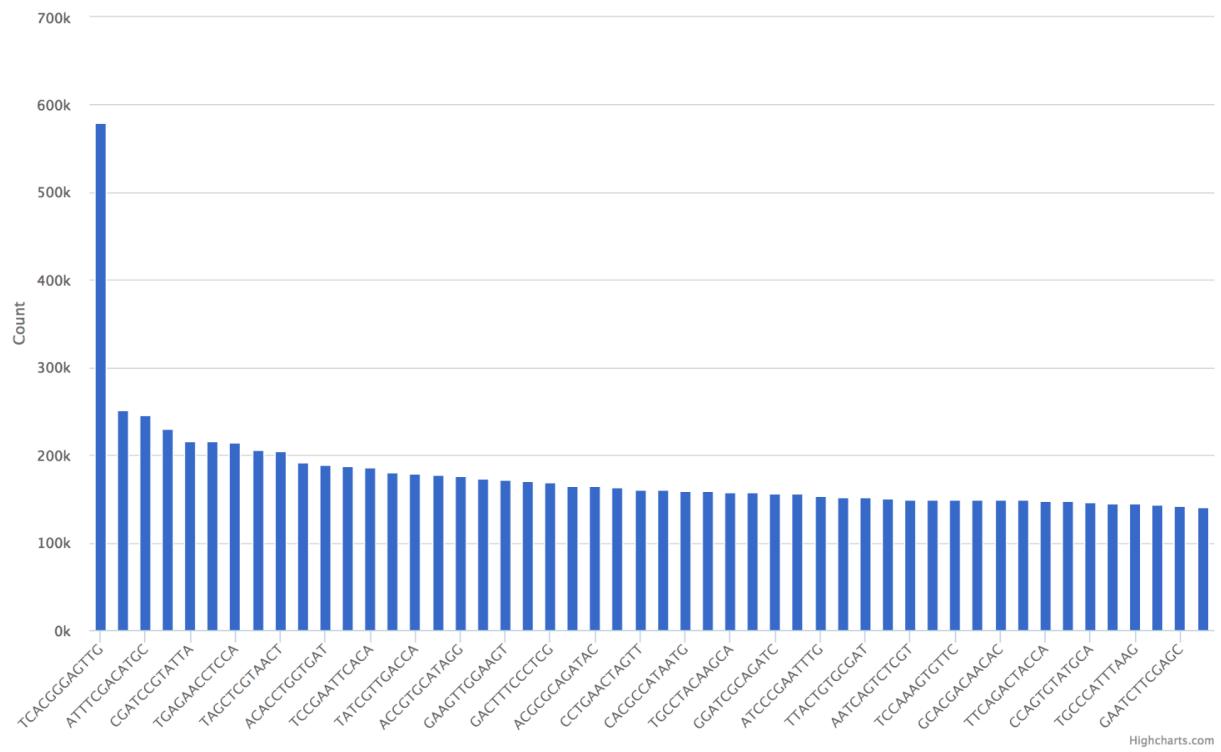

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

### 2.7.4 Chart Properties

Option	Value
type	the required entry is ‘bar’
subtitle	an optional subtitle for the plot
x_label	x-axis label
x_value	the header label defined in filename corresponding to x-values
y_label	y-axis label
y_value	the header label defined in filename corresponding to y-values

Example JSON entry:

```
{
  "filename": "bar_plot_example.csv",
  "tab_name": "Barcode Counts",
  "chart_properties": {
    "type": "bar",
    "x_value": "Barcode",
    "x_label": "Barcode",
    "y_value": [ "Count" ],
    "y_label": "Count"
  }
}
```

## 2.8 Heatmap

A heatmap is generated using tile quality data from FastQC, but a custom one can be generated using data with an x, a y, and value associated with the coordinate.

### 2.8.1 Example Data

Tile	Base	Mean
1101	1	0.4305
1101	2	0.1525
1101	3	0.0202

### 2.8.2 Usage to Add

Tile example data from FastQC can be added manually using:

```
$ fqc add --x-value Barcode --y-value Count --min-value -10 --max-value 10 \
  plot_data/2016/160912_M03018/config.json \
  "Barcode Counts" \
  bar \
  example/data/tables/160912_top50barcodes.csv
```

### 2.8.3 Plot Options

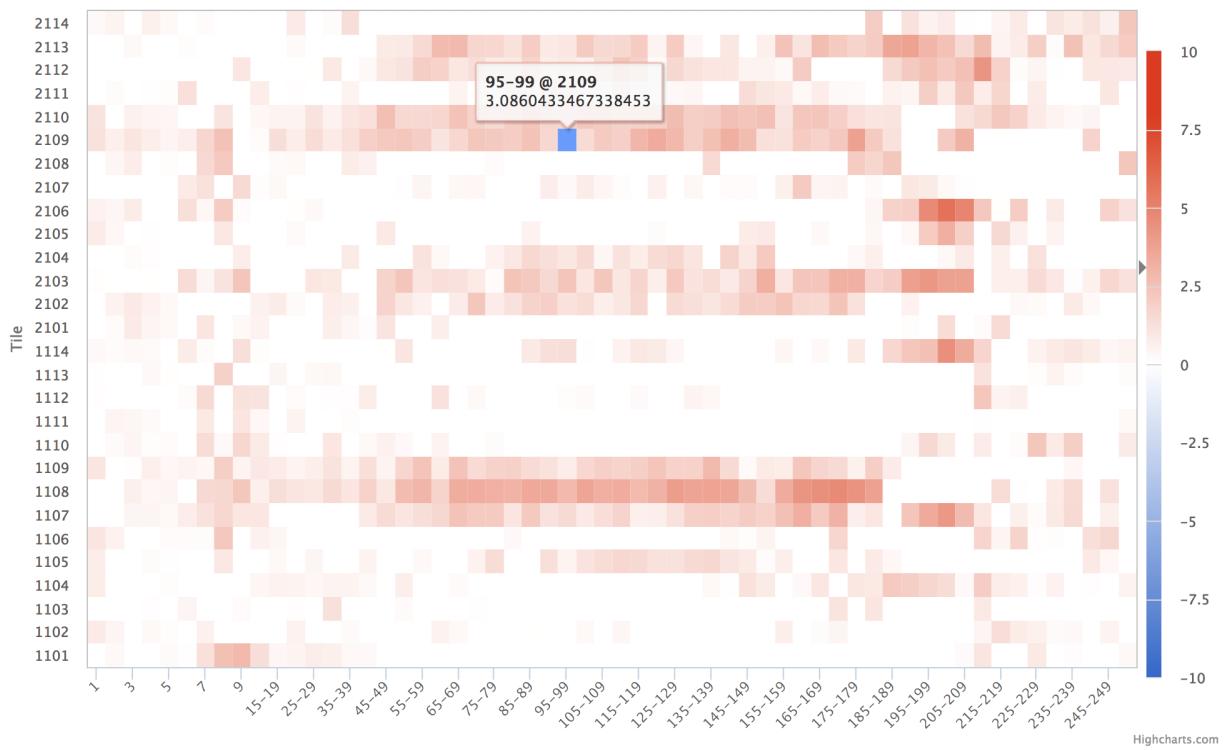

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

### 2.8.4 Chart Properties

Option	Value
type	the required entry is ‘heatmap’
subtitle	an optional subtitle for the plot
x_label	x-axis label
x_value	the header label defined in filename corresponding to x-values
y_label	y-axis label
y_value	the header label defined in filename corresponding to y-values
value	the header label defined in filename corresponding to heatmap values
min_color	the minimum color used in the heatmap color map
mid_color	the middle color used in the heatmap color map
max_color	the maximum color used in the heatmap color map
min	the minimum value defined for the heatmap color map
max	the maximum value defined for the heatmap color map

Example JSON entry:

```
{
  "filename": "R1/Per_tile_sequence_quality.csv",
  "tab_name": "Quality by Tile",
  "status": "pass",
  "chart_properties": {
    "type": "heatmap",
    "subtitle": "Per Tile Average Quality Deviation",
    "x_label": "Position",
    "x_value": "Base",
    "y_label": "Tile",
    "y_value": "Tile",
    "shape": "square",
    "value": "Mean",
    "min": "-10",
    "max": "10",
    "min_color": "#36c",
    "mid_color": "#ffffff",
    "max_color": "#dc3912"
  }
}
```

## 2.9 Histogram

This plot is useful in the context of 16S amplicon sequencing after we've quality trimmed reads then joined paired-end reads. Tabulating observed read lengths and their respective counts can give insights into the quality of the sequence ends.

### 2.9.1 Example Data

Length
153
179
177
191
198

### 2.9.2 Usage to Add

Given the example data for read length counts:

```
$ fqc add -x Length -Y "Read Count" --step 10 \
  plot_data/2016/160912_M03018/config.json \
  "Joined Read Lengths" \
  histogram \
  data/tables/histogram_example.csv
```

### 2.9.3 Plot Options

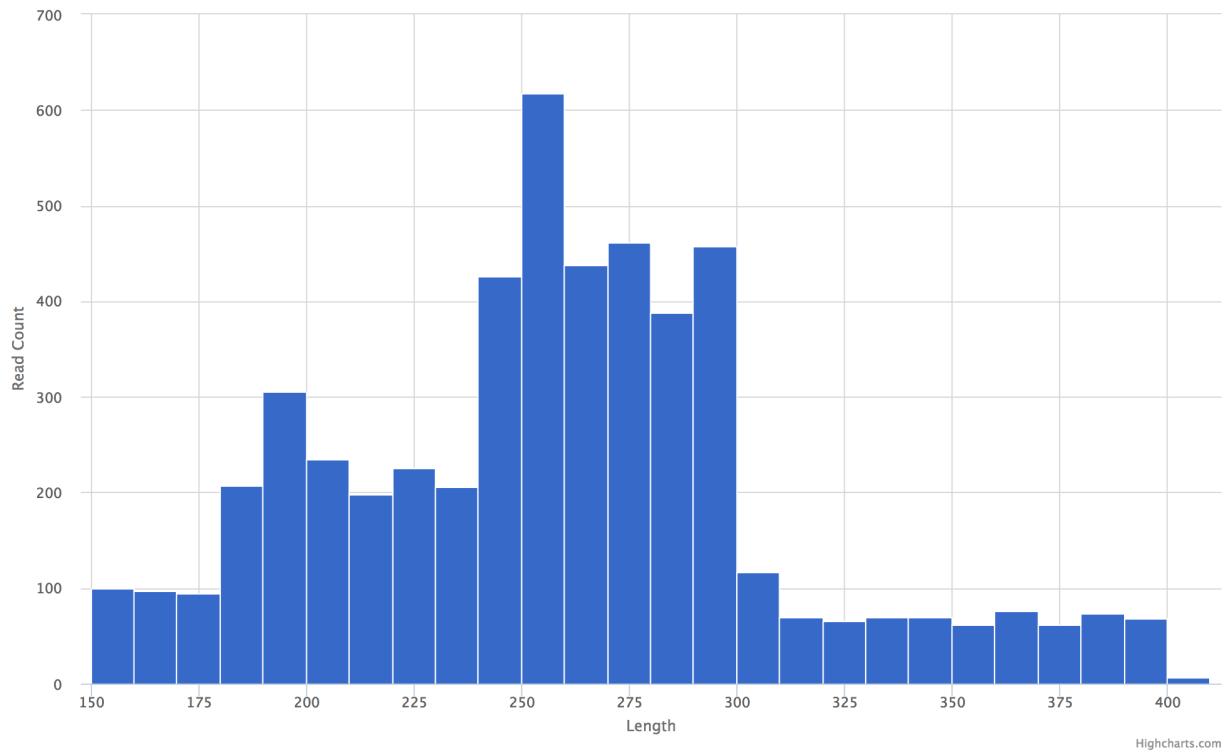

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

### 2.9.4 Chart Properties

Option	Value
type	the required entry is ‘histogram’
subtitle	an optional subtitle for the plot
x_label	x-axis label
x_value	the header label defined in filename corresponding to values
y_label	y-axis label
step	histogram bin size

Example JSON entry:

```
{
  "filename": "histogram_example.csv",
  "tab_name": "Joined Read Lengths",
  "chart_properties": {
    "type": "histogram",
    "x_value": "Length",
    "x_label": "Length",
    "y_label": "Read Count",
    "step": 10
  }
}
```

## 2.10 Line

### 2.10.1 Example Data

Quality	Count
18	1.0
19	14.0
20	46.0
21	111.0
22	141.0

### 2.10.2 Usage to Add

Given quality data across read positions, we can add this plot using:

```
$ fqc add --x-value Barcode --y-value Count \
  plot_data/2016/160912_M03018/config.json \
  "Barcode Counts" \
  bar \
  example/data/tables/160912_top50barcodes.csv
```

### 2.10.3 Plot Options

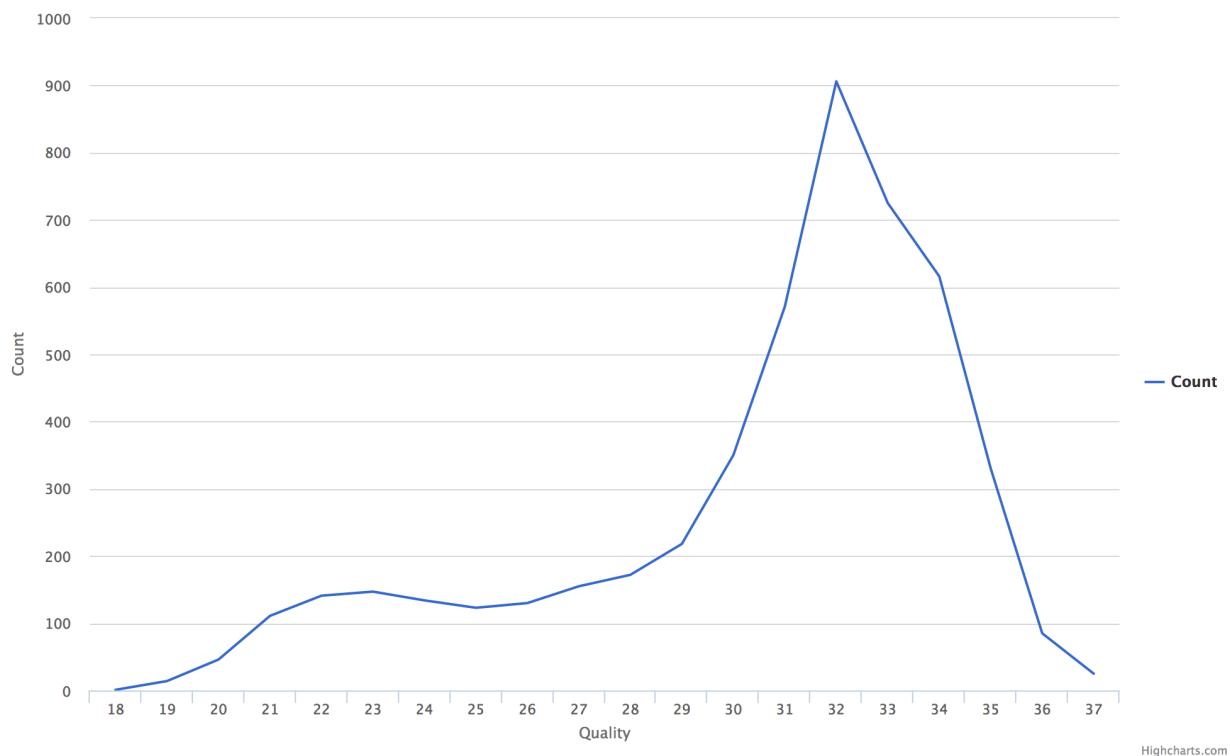

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

### 2.10.4 Chart Properties

Option	Value
type	the required entry is ‘bar’
subtitle	an optional subtitle for the plot
x_label	x-axis label
x_value	the header label defined in filename corresponding to x-values
y_label	y-axis label
y_value	the header label defined in filename corresponding to y-values

Example JSON entry:

```
{
  "filename": "simple_line.csv",
  "tab_name": "Quality by Position",
  "chart_properties": {
    "type": "line",
    "x_value": "Quality",
    "x_label": "Quality",
    "y_value": ["Count"],
    "y_label": "Count"
  }
}
```

Highcharts.com

## 2.10.5 Multi-line Plots

When multiple y-values are being plotted:

Base	G	A	T	C
1	45.96	51.62	1.38	1.04
2	0.8999999999999999	7.26	1.5	90.34
3	8.14	79.12	11.72	1.02
4	1.1199999999999999	5.1	4.5	89.28
5	1.82	1.0999999999999999	1.32	95.76

These data are added by specifying `-y` multiple times:

```
$ fqc add -x Base -X Position \
  -y G -y A -y C -y T \
  -Y Percent \
  plot_data/2016/160912_M03018/config.json \
  "Content by Position" \
  line \
  data/tables/multiple_line.csv
```

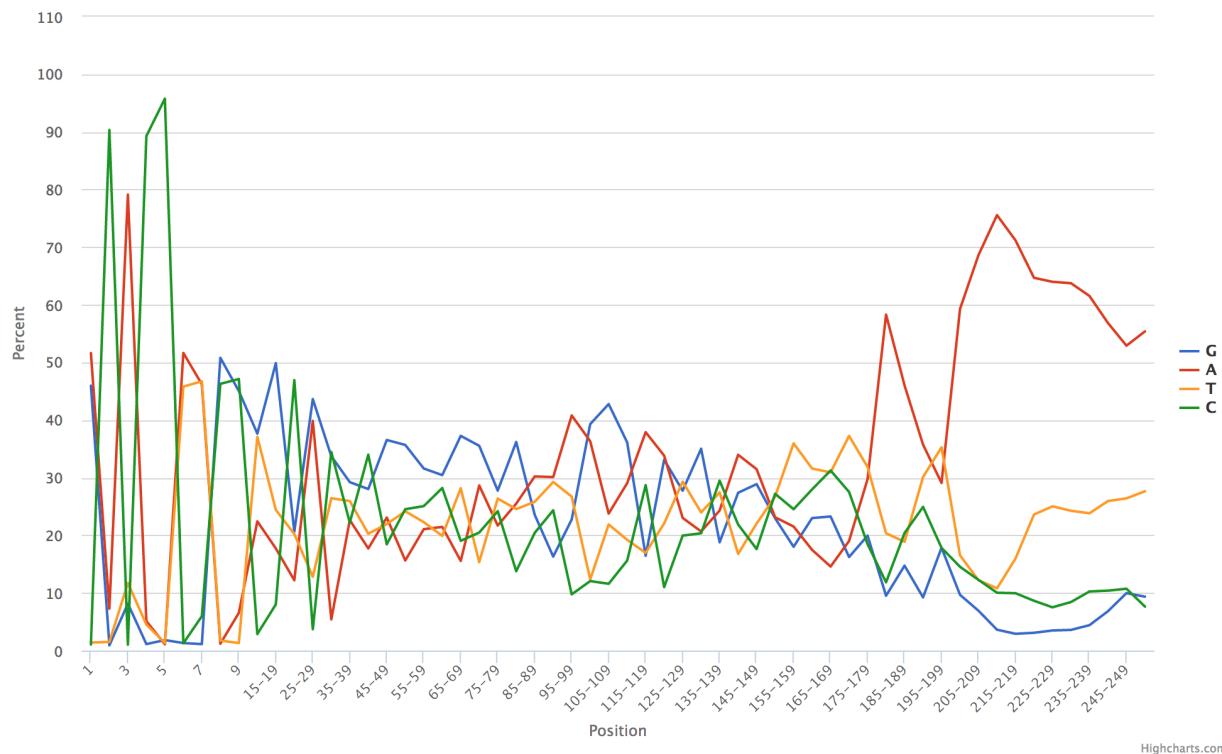

Example JSON entry:

```
{
  "filename": "multiple_line.csv",
  "tab_name": "Content by Position",
  "chart_properties": {
    "type": "line",
```

```

    "x_label": "Position",
    "x_value": "Base",
    "y_label": "Percent",
    "y_value": [
        "G",
        "A",
        "C",
        "T"
    ]
}
}

```

## 2.11 Plate Heatmap

This plot is intended to be a nicely spaced heatmap specifically for showing trends over sample plates. Definitions for colors are optional and will be used to outline their respective coordinates.

An example for this plot type is executed in the workflow at [plate-heatmap-example](#).

### 2.11.1 Example Data

This is an alternate example from the workflow to show how to deal with multiple label colors.

WELL_COL	WELL_ROW	TOTAL_PAIRED_READS	LABEL
1	A	205	
2	A	103	POS CTRL
3	A	125	NEG CTRL

## 2.11.2 Usage to Add

```
$ fqc add --x-value WELL_COL --y-value WELL_ROW \
    --value TOTAL_PAIREDED_READS --label LABEL \
    --colors 'NEG CTRL:#1f77b4,POS CTRL:#d62728' \
    plot_data/2016/160912_M03018/config.json \
    'Abundance by Plate' \
    plateheatmap \
    data/tables/160912_plate_1.csv
```

## 2.11.3 Plot Options

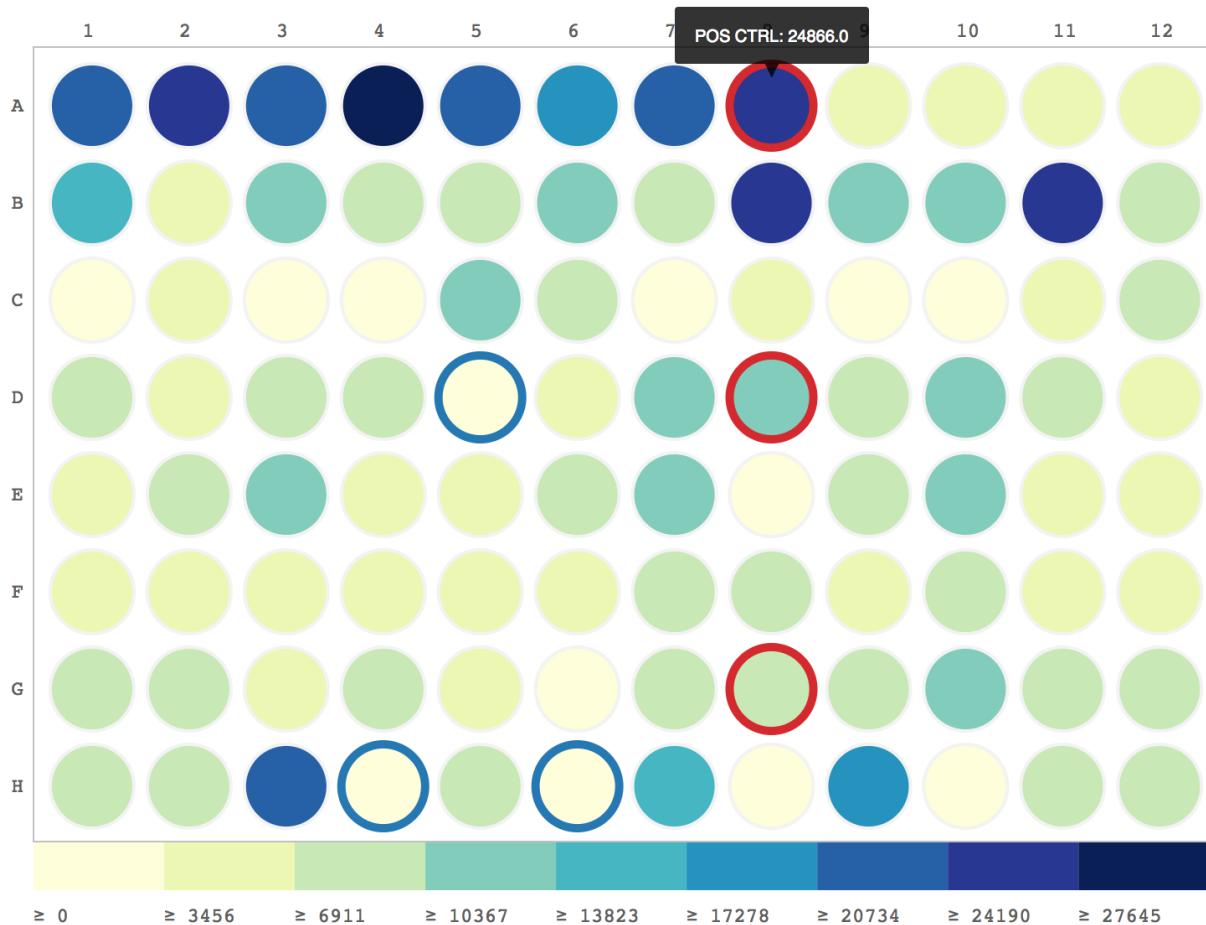

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <a href="#">Plot Tabs</a> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <a href="#">Tab Status</a> )
chart_properties	See table below

## 2.11.4 Chart Properties

Option	Value
type	the required entry is ‘plateheatmap’
subtitle	an optional subtitle for the plot
x_label	x-axis label
x_value	the header label defined in filename corresponding to x-values
y_label	y-axis label
y_value	the header label defined in filename corresponding to y-values
colors	comma separated list of label (in your data):color value pairs, e.g. ‘NEG CTRL:#1f77b4,POS CTRL:#d62728’

Example JSON entry:

```
{
    "filename": "160912_plate_1.csv",
    "tab_name": "Abundance by Plate",
    "chart_properties": {
        "type": "plateheatmap",
        "x_value": "WELL_COL",
        "x_label": "WELL_COL",
        "y_value": ["WELL_ROW"],
        "y_label": "WELL_ROW",
        "value": "TOTAL_PAIREDED_READS",
        "label": "LABEL",
        "colors": {
            "POS CTRL": "#d62728",
            "NEG CTRL": "#1f77b4"
        }
    }
}
```

## 2.12 Table

### 2.12.1 Example Data

Measure	Value
Total Reads	15752091
Fraction On Target	0.67042235853
Fraction Off Target	1.0284348916e-05
Fraction Unmatched	0.329567357121
Coefficient of Distribution (G)	0.260394791718

### 2.12.2 Usage to Add

```
$ fqc add --prepend \
  plot_data/2016/160912_M03018/config.json \
  'Run Stats' \
  table \
  data/tables/160912_summary.csv
```

### 2.12.3 Plot Options

Option	Value
filename	supports either a single file path or list of lists with [plot tab name, file path] pairs (see <i>Plot Tabs</i> )
tab_name	left main menu entry
status	left main menu icon – supports ‘pass’, ‘fail’, ‘warn’, or alternatively, omitted (see <i>Tab Status</i> )

Example JSON entry:

```
{
    "filename": "160912_summary.csv",
    "chart_properties": {
        "type": "table"
    },
    "tab_name": "Run Stats"
}
```
