Release 0.1.1

Olivier Cazade

Dec 18, 2018

General:

1	Public API	1
2	Trading API	3
3	Indices and tables	13
	Python Module Index	15

CHAPTER 1

Public API

Public API does not require any Poloniex account.

Note that making more than 6 calls per second to the public API, or repeatedly and needlessly fetching excessive amounts of data, can result in your IP being banned.

1.1 Ticker

`poloniex_aio.public.returnTicker(session)`

Returns the ticker for all markets.

Parameters `session` – Aiohttp client session object

1.2 24-hour volume

`poloniex_aio.public.return24hVolume(session)`

Returns the 24-hour volume for all markets, plus totals for primary currencies.

Parameters `session` – Aiohttp client session object

1.3 Order book

`poloniex_aio.public.returnOrderBook(session, *, currencyPair)`

Returns the order book for a given market, as well as a sequence number for use with the Push API and an indicator specifying whether the market is frozen.

Parameters

- `session` – Aiohttp client session object
- `currencyPair (String)` – Market identifier, example : BTC_ETH

1.4 Trade history

`poloniex_aio.public.returnTradeHistory(session, *, currencyPair, start=None, end=None)`

Returns the past 200 trades for a given market, or up to 50,000 trades between a range specified in UNIX timestamps by the “start” and “end” parameters.

Parameters

- **session** – Aiohttp client session object
- **currencyPair** (*String*) – Market identifier, example : BTC_ETH
- **start** (*String*) – UNIX timestamp. Every returned trade will have a timestamps greater or equal.
- **end** (*String*) – UNIX timestamp. Every returned trade will have a timestamps lower or equal.

1.5 Chart data

`poloniex_aio.public.returnChartData(session, *, currencyPair, start, end, period)`

Returns candlestick chart data.

Parameters

- **session** – Aiohttp client session object
- **currencyPair** (*String*) – Market identifier, example : BTC_ETH
- **start** (*String*) – UNIX timestamp. Every returned trade will have a timestamps greater or equal.
- **end** (*String*) – UNIX timestamp. Every returned trade will have a timestamps lower or equal.
- **period** (*String*) – candlestick period in seconds; valid values are 300, 900, 1800, 7200, 14400, and 86400

1.6 Currencies

`poloniex_aio.public.returnCurrencies(session)`

Parameters **session** – Aiohttp client session object

Returns information about currencies.

1.7 Loan orders

`poloniex_aio.public.returnLoanOrders(session, *, currency)`

Returns the list of loan offers and demands for a given currency, specified by the “currency” GET parameter.

Parameters

- **session** – Aiohttp client session object
- **currency** (*String*) – Currency identifier, example : BTC

CHAPTER 2

Trading API

To use the trading API, you will need to create an API key.

Please note that there is a default limit of 6 calls per second.

2.1 Balances

```
poloniex_aio.trading.returnBalances(session, api_key, secret_key)
```

Returns all of your available balances

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.2 Complete balances

```
poloniex_aio.trading.returnCompleteBalances(session, api_key, secret_key, *, account=None)
```

Returns all of your balances, including available balance, balance on orders, and the estimated BTC value of your balance.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **account** (*String*) – By default, this call is limited to your exchange account; set this parameter to “all” to include your margin and lending accounts.

2.3 Deposit Addresses

poloniex_aio.trading.**returnDepositAddresses** (*session, api_key, secret_key*)

Returns all of your deposit addresses.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.4 Generate new address

poloniex_aio.trading.**generateNewAddress** (*session, api_key, secret_key, *, currency*)

Generates a new deposit address

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currency** (*String*) – The address will be generated for the currency specified here

2.5 Deposits and withdrawals history

poloniex_aio.trading.**returnDepositsWithdrawals** (*session, api_key, secret_key, *, start=None, end=None*)

Returns your deposit and withdrawal history within a range

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **start** (*String*) – UNIX timestamp. Every returned value will have a timestamps greater or equal.
- **end** (*String*) – UNIX timestamp. Every returned value will have a timestamps lower or equal.

2.6 Open orders

poloniex_aio.trading.**returnOpenOrders** (*session, api_key, secret_key, *, currencyPair*)

Returns your open orders for a given market.

Parameters

- **session** – Aiohttp client session object

- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currencyPair** (*String*) – The currency pair. Set this to “all” to return open orders for all markets.

2.7 Trade History

```
poloniex_aio.trading.returnTradeHistory(session, api_key, secret_key, *, currencyPair,  
start=None, end=None, limit=None)
```

Returns your trade history for a given market.

If you do not specify a range, it will be limited to one day.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currencyPair** (*String*) – The currency pair. Set this to “all” to return open orders for all markets.
- **start** (*String*) – UNIX timestamp. Every returned value will have a timestamps greater or equal.
- **end** (*String*) – UNIX timestamp. Every returned value will have a timestamps lower or equal.
- **limit** (*String*) – Maximum number of returned values. Default to 500, max 10 000

2.8 Trades involving an order

```
poloniex_aio.trading.returnOrderTrades(session, api_key, secret_key, *, orderNumber)
```

Returns all trades involving a given order

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **orderNumber** (*String*) – The order id

2.9 Buy order

```
poloniex_aio.trading.buy(session, api_key, secret_key, *, currencyPair, rate, amount, fil-  
lOrKill=None, immediateOrCancel=None, postOnly=None)
```

Places a limit buy order in a given market.

Parameters

- **session** – Aiohttp client session object

- **api_key** (*String*) – the API key
- **secret_key** (*String*) – the API secret key
- **currencyPair** (*String*) – the currency pair
- **rate** (*String*) – the rate to buy
- **amount** (*String*) – the amount to buy
- **fillOrKill** (*String*) – a fill-or-kill order will either fill in its entirety or be completely aborted
- **immediateOrCancel** (*String*) – an immediate-or-cancel order can be partially or completely filled, but any portion of the order that cannot be filled immediately will be canceled rather than left on the order book.
- **postOnly** (*String*) – a post-only order will only be placed if no portion of it fills immediately; this guarantees you will never pay the taker fee on any part of the order that fills.

2.10 Sell order

```
poloniex_aio.trading.sell(session, api_key, secret_key, *, currencyPair, rate, amount, fillOrKill=None, immediateOrCancel=None, postOnly=None)
```

Places a sell order in a given market. Parameters and output are the same as for the buy method.

2.11 Cancel an order

```
poloniex_aio.trading.cancelOrder(session, api_key, secret_key, *, orderNumber)
```

Cancels an order you have placed in a given market.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **orderNumber** (*String*) – Order ID

2.12 Move an order

```
poloniex_aio.trading.moveOrder(session, api_key, secret_key, *, orderNumber, rate, amount=None, immediateOrCancel=None, postOnly=None)
```

Cancels an order and places a new one of the same type in a single atomic transaction, meaning either both operations will succeed or both will fail.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **orderNumber** (*String*) – The order id

- **rate** (*String*) – the new rate
- **amount** (*String*) – the new amount
- **immediateOrCancel** (*String*) – an immediate-or-cancel order can be partially or completely filled, but any portion of the order that cannot be filled immediately will be canceled rather than left on the order book.
- **postOnly** (*String*) – a post-only order will only be placed if no portion of it fills immediately; this guarantees you will never pay the taker fee on any part of the order that fills.

2.13 Withdraw

```
poloniex_aio.trading.withdraw(session, api_key, secret_key, *, currency, amount, address, paymentId=None)
```

Immediately places a withdrawal for a given currency

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currency** (*String*) – The currency to withdraw
- **amount** (*String*) – The amount to withdraw
- **address** (*String*) – The destination address
- **paymentId** (*String*) – XMR only

2.14 Fee info

```
poloniex_aio.trading.returnFeeInfo(session, api_key, secret_key)
```

If you are enrolled in the maker-taker fee schedule, returns your current trading fees and trailing 30-day volume in BTC.

This information is updated once every 24 hours.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.15 Balances sorted by account

```
poloniex_aio.trading.returnAvailableAccountBalances(session, api_key, secret_key, *, account=None)
```

Returns your balances sorted by account.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **account** (*String*) – if you wish to fetch only the balances of one account, set the account here.

2.16 Tradable balances

`poloniex_aio.trading.returnTradableBalances(session, api_key, secret_key)`

Returns your current tradable balances for each currency in each market for which margin trading is enabled.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.17 Transfers

`poloniex_aio.trading.transferBalance(session, api_key, secret_key, *, currency, amount, fromAccount, toAccount)`

Transfers funds from one account to another.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **fromAccount** (*String*) – Source account
- **toAccount** (*String*) – Destination account

2.18 Margin account summary

`poloniex_aio.trading.returnMarginAccountSummary(session, api_key, secret_key)`

Returns a summary of your entire margin account.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.19 Margin buy order

```
poloniex_aio.trading.marginBuy(session, api_key, secret_key, *, currencyPair, rate, amount, lendingRate=None)
```

Places a margin buy order in a given market.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currencyPair** (*String*) – The currency pair
- **rate** (*String*) – The order rate.
- **amount** (*String*) – The order amount.
- **lendingRate** (*String*) – Maximum lending rate.

2.20 Margin sell order

```
poloniex_aio.trading.marginSell(session, api_key, secret_key, *, currencyPair, rate, amount, lendingRate=None)
```

Places a margin sell order in a given market. Parameters and output are the same as for the marginBuy method.

2.21 Margin position

```
poloniex_aio.trading.getMarginPosition(session, api_key, secret_key, *, currencyPair)
```

Returns information about your margin position in a given market.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currencyPair** (*String*) – The currency pair. Set this to “all” if you wish to fetch all of your margin positions at once.

2.22 Close margin position

```
poloniex_aio.trading.closeMarginPosition(session, api_key, secret_key, *, currencyPair)
```

Closes your margin position in a given market.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currencyPair** (*String*) – The currency pair.

2.23 Create a loan offer

```
poloniex_aio.trading.createLoanOffer(session, api_key, secret_key, *, currency, amount, duration, autoRenew, lendingRate)
```

Creates a loan offer for a given currency.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **currency** (*String*) – The currency to lend
- **amount** (*String*) – Amount of currency to lend
- **duration** (*String*) – Lending duration
- **autoRenew** (*String*) – Should the loan offer auto renew.
- **lendingRate** (*String*) – The lending rate

2.24 Cancel a loan offer

```
poloniex_aio.trading.cancelLoanOffer(session, api_key, secret_key, *, orderNumber)
```

Cancels a loan offer

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **orderNumber** (*String*) – The loan offer ID

2.25 Open loan offers

```
poloniex_aio.trading.returnOpenLoanOffers(session, api_key, secret_key)
```

Returns your open loan offers for each currency.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.26 Active loans

```
poloniex_aio.trading.returnActiveLoans(session, api_key, secret_key)
```

Returns your active loans for each currency.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key

2.27 Lending history

```
poloniex_aio.trading.returnLendingHistory(session, api_key, secret_key, *, start, end,  
                                limit=None)
```

Returns your lending history within a time range.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **start** (*String*) – UNIX timestamp. Every returned value will have a timestamps greater or equal.
- **end** (*String*) – UNIX timestamp. Every returned value will have a timestamps lower or equal.
- **limit** (*String*) – Maximum number of returned values.

2.28 Toggles the autoRenew setting

```
poloniex_aio.trading.toggleAutoRenew(session, api_key, secret_key, *, orderNumber)
```

Toggles the autoRenew setting on an active.

Parameters

- **session** – Aiohttp client session object
- **api_key** (*String*) – The API key
- **secret_key** (*String*) – The API secret key
- **orderNumber** (*String*) – The loan ID
