
PyLogger Documentation

Release 0.1

eet6646

March 31, 2016

1	Installation	3
2	Pages	5
3	License	9
	Python Module Index	11

PyLogger is a simple data to file logging module. Use it to quickly log and debug scripts, or log something over time. Log events, warnings, exceptions and more into a readable log file with a customizable output!

Installation

```
$ python setup.py install
```

2.1 PyLogger Documentation

```
class pylogger.PyLogger (filename='pylogger.log', defaultlogtype='INFO', logformat='[{timestamp}]  
                        {logtype}: {message}', timestamp='%Y-%m-%d %H:%M:%S', prefix='',  
                        postfix='n')
```

The PyLogger class

Initialize a PyLogger object.

Parameters

- **filename** (*str*) – The filename to use
- **defaultlogtype** (*str*) – Initial log type to use [INFO]
- **timestamp** (*str*) – Initial timestamp format [%Y-%m-%d %H:%M:%S]
- **prefix** (*str*) – String to insert before the log message
- **postfix** (*str*) – String to append to the log message

open (*args)

Initialize a new logger

clear ()

Clear the content of the log file

Returns True – file cleared

Raises IOError, Exception

delete ()

Delete the log file

Returns True – file deleted

Raises OSError, Exception

pause ()

Pause the logging until resumed

isEnabled ()

Check if enabled/paused

Returns True – enabled

resume ()

Resume the logging from paused

setLogType (*logtype*)

Set the log type

Parameters **logtype** (*str*) – Log type

setLogFormat (*logformat*)

Set custom log format

Parameters **logformat** (*str*) – Log format Available options: {timestamp}, {logtype}, {message} Example: [{timestamp}]{logtype}: {message}

resetLogFormat ()

Reset log format to default format

setTimestampFormat (*timestamp*)

Set custom timestamp format

Parameters **timestamp** (*str*) – Timestamp Example: %Y-%m-%d %H:%M:%S

resetTimestampFormat ()

Reset timestamp format

getTimeStamp ()

Function to get the current time, returns in the timestamp format

Returns Timestamp string

createIfNonExistent ()

Create an empty log file if non existant

Returns True – file cleared

Raises IOError, Exception

log (*logstr*, *logtype*='')

Function to log message to file.

Parameters

- **logstr** (*str*) – The string you want to log
- **logtype** (*str*) – Optional argument, custom log type. If not provided, defaults to defined log type.

Returns True – String has been logged to file

Raises IOError,Exception7

info (*logstr*)

Function that calls the log function with type INFO

warning (*logstr*)

Function that calls the log function with type WARNING

error (*logstr*)

Function that calls the log function with type ERROR

critical (*logstr*)

Function that calls the log function with type CRITICAL

exception (*logstr*)

Function that calls the log function with type EXCEPTION

2.2 Examples

p

pylogger, [5](#)

C

`clear()` (pylogger.PyLogger method), 5
`createIfNonExistent()` (pylogger.PyLogger method), 6
`critical()` (pylogger.PyLogger method), 6

D

`delete()` (pylogger.PyLogger method), 5

E

`error()` (pylogger.PyLogger method), 6
`exception()` (pylogger.PyLogger method), 6

G

`getTimeStamp()` (pylogger.PyLogger method), 6

I

`info()` (pylogger.PyLogger method), 6
`isEnabled()` (pylogger.PyLogger method), 5

L

`log()` (pylogger.PyLogger method), 6

O

`open()` (pylogger.PyLogger method), 5

P

`pause()` (pylogger.PyLogger method), 5
`PyLogger` (class in pylogger), 5
`pylogger` (module), 5

R

`resetLogFormat()` (pylogger.PyLogger method), 6
`resetTimestampFormat()` (pylogger.PyLogger method), 6
`resume()` (pylogger.PyLogger method), 5

S

`setLogFormat()` (pylogger.PyLogger method), 6
`setLogType()` (pylogger.PyLogger method), 6
`setTimestampFormat()` (pylogger.PyLogger method), 6

W

`warning()` (pylogger.PyLogger method), 6
