**This project is not developed anymore!**

Twitch is a trademark or registered trademark of Twitch Interactive, Inc. in the U.S. and/or other countries. “pytwitcher” and “pytwitcherapi” is not operated by, sponsored by, or affiliated with Twitch Interactive, Inc. in any way.

Python API for interacting with [twitch.tv](#).

# CHAPTER 1

---

## Features

---

- Easy-to-use object oriented high-level API
- Search and query information about games, channels, streams and users
- Get the livestream playlist
- OAuth Authentication. Can retrieve followed streams and more...
- Good documentation and test coverage
- IRC client for the chat (with IRC v3 tag support)

**Welcome to pytwitcherapi's documentation!**

# CHAPTER 2

---

## Contents:

---

## Installation

At the command line either via easy\_install or pip:

```
$ easy_install pytwitcherapi  
$ pip install pytwitcherapi
```

Or, if you have virtualenvwrapper installed:

```
$ mkvirtualenv pytwitcherapi  
$ pip install pytwitcherapi
```

## Usage

This is a litte quickstart guide. For more information go to the Usermanual.

### API requests

`pytwitcherapi.TwitchSession` class is the central class for interacting with [twitch.tv](#):

```
1 import pytwitcherapi  
2  
3 ts = pytwitcherapi.TwitchSession()
```

To query all top games use:

```
5 topgames = ts.top_games()
```

Get streams and playlist for every game:

```
7 for game in topgames:
8     streams = ts.get_streams(game=game)
9     for stream in streams:
10         channel = stream.channel
11         playlist = ts.get_playlist(channel)
```

As you can see games, channels, streams are wrapped into objects. See `pytwitcherapi.Game`, `pytwitcherapi.Channel`, `pytwitcherapi.Stream`, `pytwitcherapi.User`.

You can use your own Client-ID for twitch by setting the environment variable `PYTWITCHER_CLIENT_ID`.

## Usermanual

In here you find help for using the `pytwitcherapi`. There are also some simple examples.

### Requests

#### API requests

`pytwitcherapi.TwitchSession` class is the central class for interacting with `twitch.tv`:

```
1 import pytwitcherapi
2
3 ts = pytwitcherapi.TwitchSession()
```

To query all top games use:

```
5 topgames = ts.top_games()
```

Get streams and playlist for every game:

```
7 for game in topgames:
8     streams = ts.get_streams(game=game)
9     for stream in streams:
10         channel = stream.channel
11         playlist = ts.get_playlist(channel)
```

As you can see games, channels, streams are wrapped into objects. See `pytwitcherapi.Game`, `pytwitcherapi.Channel`, `pytwitcherapi.Stream`, `pytwitcherapi.User`.

You can use your own Client-ID for twitch by setting the environment variable `PYTWITCHER_CLIENT_ID`.

#### Custom requests

You can also issue custom requests. The `pytwitcherapi.TwitchSession` is actually a subclass of `requests.Session`. So basically you can use `pytwitcherapi.TwitchSession.request()` to issue arbitrary requests. To make it easier to use the different twitch APIs there are a few helpers.

You can get easy access to three different twitch APIs:

- Kraken API which uses `pytwitcherapi.session.TWITCH_KRAKENURL`. Use `pytwitcherapi.session.TwitchSession.kraken_request()`.

- Usher API with uses `pytwitcherapi.session.TWITCH_USHERURL`. Use `pytwitcherapi.session.TwitchSession.usher_request()`.
- The old twitch API `pytwitcherapi.session.TWITCH_APIURL`. Use `pytwitcherapi.session.TwitchSession.oldapi_request()`.

```

1 import pytwitcherapi
2
3 ts = pytwitcherapi.TwitchSession()
4
5 topgames = ts.top_games()
6
7 for game in topgames:
8     streams = ts.get_streams(game=game)
9     for stream in streams:
10         channel = stream.channel
11         playlist = ts.get_playlist(channel)

```

## Authentication

For some methods of `pytwitcherapi.TwitchSession`, the user needs to grant pytwitcher authorization. Twitch [Authentication](#) is based on OAuth. We use the [implicit grant workflow](#). In short, the user visits a website. Has to login, and allow pytwitcher. Twitch will redirect him to `pytwitcherapi.constants.REDIRECT_URI`. In the url fragment of that redirection, one can find the token we need. To make it simple for the user, here is what should be done for authentication:

- Call `pytwitcherapi.TwitchSession.start_login_server()`. This will create a thread that serves a server on `pytwitcherapi.constants.LOGIN_SERVER_ADDRESS`. Once the user gets redirected, this server will pick up the request and extract the token:

```

1 import pytwitcherapi
2
3 ts = pytwitcherapi.TwitchSession()
4 ts.start_login_server()

```

- Get the url `pytwitcherapi.TwitchSession.get_auth_url()` and send the user to visit that url in his favorite webbrowser. He might have to login, and allow pytwitcher, if he did not already:

```

6 import webbrowser
7 url = ts.get_auth_url()
8 webbrowser.open(url)

```

- Wait until the user finished login in. Then call `pytwitcherapi.TwitchSession.shutdown_login_server()` to shutdown the server and join the thread:

```

10 raw_input("Press ENTER when finished")
11 ts.shutdown_login_server()

```

- Check if the user authorized the session with `pytwitcherapi.TwitchSession.authorized()`:

```

13 assert ts.authorized, "Authorization failed! Did the user allow it?"
14 print "Login User: %s" % ts.current_user

```

- Now you can call methods that require authentication:

```
16     streams = ts.followed_streams()
```

## Chat

The twitch chat is based on the IRC protocol RFC1459. The official documentation on the twitch chat is here: [Twitch IRC Doc](#). The [irc python lib](#) might also be useful, because we use it as backend.

`pytwitcherapi.IRCClient` is a simple client, which can only connect to one channel/server at a time. When building applications, you probably wanna run the `IRCCClient` in another thread, so it doesn't block your application. The client is thread safe and has quite a few methods to send IRC commands, if the client is running in another thread. They are wrapped versions of methods from `irc.client.ServerConnection`. E.g. you can simply call `pytwitcherapi.IRCClient.quit()` from another thread. Here is a simple example, where we send messages to the channel. Change `input` to `raw_input` for python 2:

```
1 import threading
2
3 import pytwitcherapi
4
5 session = ... # we assume an authenticated TwitchSession
6 channel = session.get_channel('somechannel')
7 client = pytwitcherapi.IRCClient(session, channel)
8 t = threading.Thread(target=client.process_forever)
9 t.start()
10
11 try:
12     while True:
13         m = input('Send Message:')
14         if not m: break;
15         # will be processed in other thread
16         # sends a message to the server
17         client.send_msg(m)
18 finally:
19     client.shutdown()
20     t.join()
```

---

**Important:** The connection will wait/block if you send more messages than twitch allows. See `pytwitcherapi.chat.ServerConnection3`.

---

You can make the client handle different IRC events. Subclass the client and create a method `on_<eventtype>`. For example to greet everyone who joins an IRC channel:

```
1 import pytwitcherapi
2
3 class MyIRCCClient(pytwitcherapi.IRCClient):
4
5     def on_join(self, connection, event):
6         """Handles the join event and greets everyone
7
8             :param connection: the connection with the event
9             :type connection: :class:`irc.client.ServerConnection`  

10            :param event: the event to handle
11            :type event: :class:`irc.client.Event`
12            :returns: None
13            """
14
```

```

14     target = event.source
15     self.privmsg(target, 'Hello %s!' % target)

```

If you override `pytwitcherapi.IRCClient.on_pubmsg()` or `pytwitcherapi.IRCClient.on_privmsg()` make sure to call the super method:

```

1 from pytwitcherapi import chat
2
3 class MyIRCClient(pytwitcherapi.IRCClient):
4
5     def on_privmsg(self, connection, event):
6         super(MyIRCClient, self).on_privmsg(connection, event)
7
8         print chat.Message3.from_event(event)

```

But printing out messages is not really useful. You probably want to access them in another thread. All private and public messages are stored in a thread safe message queue. By default the queue stores the last 100 messages. You can alter the queuesize when creating a client. 0 will make the queue store all messages.

---

**Note:** The Client is using two connections. One for sending messages (`pytwitcherapi.IRCClient.in_connection`) and one for receiving (`pytwitcherapi.IRCClient.in_connection`) them. With one message, you wouldn't receive your own messages processed from the server (with tags).

---

Here is a little example. To quit press CTRL-C:

```

1 import threading
2 import queue # Queue for python 2
3
4 import pytwitcherapi
5
6 session = ... # we assume an authenticated TwitchSession
7 channel = session.get_channel('somechannel')
8 client = pytwitcherapi.IRCClient(session, channel, queuesize=0)
9 t = threading.Thread(target=client.process_forever)
10 t.start()
11
12 try:
13     while True:
14         try:
15             m = client.messages.get(block=False)
16         except queue.Empty:
17             pass
18         else:
19             # Now you have the message in the main thread
20             # and can display the message in the
21             # GUI or wherever you want
22             print "Message from %s to %s: %s" % (m.source, m.target, m.text)
23     finally:
24         client.shutdown()
25         t.join()

```

## Tags and metadata

Twitch does support `tags`. Tags store metadata about a message, like the color of the user, whether he is a subscriber, the `pytwitcherapi.chat.Emote` etc. These messages get safed id the message queue: `pytwitcherapi.`

`IRCClient.messages`. See the `pytwitchapi.chat.Message3` documentation for the additional metadata.

Here is a little example. To quit press CTRL-C:

```
 1 import threading
 2 import queue # Queue for python 2
 3
 4 import pytwitchapi
 5
 6 session = ... # we assume an authenticated TwitchSession
 7 channel = session.get_channel('somechannel')
 8 client = pytwitchapi.IRCClient(session, channel, queuesize=0)
 9 t = threading.Thread(target=client.process_forever)
10 t.start()
11
12 try:
13     while True:
14         try:
15             m = client.messages.get(block=False)
16         except queue.Empty:
17             pass
18         else:
19             print m.color
20             print m.subscriber
21             print m.turbo
22             print m.emotes
23             print m.user_type
24     finally:
25         client.shutdown()
26         t.join()
```

## Developer's Documentation

Welcome to the developer's documentation. All necessary information for contributors who want to extend the project.

### Documentation

#### Build

To build the documentation locally, follow these instructions:

1. Go to the root directory of this project.
2. Install the requirements:

```
$ pip install -r docs/requirements.txt
```

This will install sphinx, some required packages and the project in development mode (`pip install -e .`). That's why you have to be in the root dir.

3. Go to the docs dir:

```
$ cd docs
```

4. Invoke sphinx build:

```
$ sphinx-build -b html -d _build/doctrees    source _build/html
```

or alternatively with make:

```
$ make html
```

on windows:

```
$ make.bat html
```

## Reference

Automatic generated Documentation by apidoc and autodoc.

### [pytwitcherapi](#)

#### [Subpackages](#)

##### [pytwitcherapi.chat](#)

#### [Submodules](#)

##### [pytwitcherapi.chat.client](#)

IRC client for interacting with the chat of a channel.

#### [Classes](#)

<a href="#"><i>ChatServerStatus</i>(server[, ip, port, status, ...])</a>	Useful for comparing the performance of servers.
<a href="#"><i>IRCClient</i>(session, channel[, queuesize])</a>	Simple IRC client which can connect to a single <code>pytwitcherapi.Channel</code> .
<a href="#"><i>Reactor</i>([on_connect, on_disconnect])</a>	Reactor that can exit the <code>process_forever</code> loop.
<a href="#"><i>Reactor3</i>([on_connect, on_disconnect])</a>	Reactor that uses irc v3 connections

##### [pytwitcherapi.chat.client.ChatServerStatus](#)

```
class pytwitcherapi.chat.client.ChatServerStatus(server, ip=None, port=None, status=None, errors=None, lag=None, description='', **kwargs)
```

Bases: `object`

Useful for comparing the performance of servers.

You can query the `status` of twitch chat servers. This class can easily wrap the result and sort the servers.

```
__init__(server, ip=None, port=None, status=None, errors=None, lag=None, description='', **kwargs)
```

Initialize a chat server status.

## Parameters

- **server** (`str`) – the server address including port. E.g. "0.0.0.0:80"
- **ip** (`str`) – the ip address
- **port** (`int`) – the port number
- **status** (`str`) – the server status. E.g. "offline", "online"
- **errors** (`int`) – the amount of errors in the last 5 min.
- **lag** (`int`) – the latency in ms
- **description** (`str`) – Wheter it is a main chat server or event server or group chat.

All other keyword arguments are ignored.

## Methods

---

<code>__init__(server[, ip, port, status, errors, ...])</code>	Initialize a chat server status.
--	----------------------------------

---

### pytwitcherapi.chat.client.IRCClient

`class pytwitcherapi.chat.client.IRCClient(session, channel, queue_size=100)`  
Bases: `irc.client.SimpleIRCClient`

Simple IRC client which can connect to a single `pytwitcherapi.Channel`.

You need an authenticated session with scope `chat_login`. Call `IRCClient.process_forever()` to start the event loop. This will block the current thread though. Calling `IRCClient.shutdown()` will stop the loop.

There are a lot of methods that can make the client send commands while the client is in its event loop. These methods are wrapped ones of `irc.client.ServerConnection`. They will always use `IRCClient.out_connection`!

You can implement handlers for all sorts of events by subclassing and creating a method called `on_<event_type>`. Note that `IRCClient.out_connection` will only get to the `IRCClient.on_welcome()` event (and then join a channel) and the `IRCClient.on_join()` event. For all other events, the `IRCClient.in_connection` will handle it and the other one will ignore it. This behaviour is implemented in `IRCClient._dispatcher()`

Little example with threads. Change `input` to `raw_input` for python 2:

```
import threading

from pytwitcherapi import chat

session = ... # we assume an authenticated TwitchSession
channel = session.get_channel('somechannel')
client = chat.IRCClient(session, channel)
t = threading.Thread(target=client.process_forever,
                      kwargs={'timeout': 0.2})
t.start()

try:
    while True:
        m = input('Send Message:')
```

```

if not m: break;
# will be processed in other thread
client.send_msg(m)

finally:
    client.shutdown()
    t.join()

```

**`__init__(session, channel, queuesize=100)`**

Initialize a new irc client which can connect to the given channel.

**Parameters**

- **session** (`pytwitcherapi.TwitchSession`) – a authenticated session. Used for querying the right server and the login username.
- **channel** (`pytwitcherapi.Channel`) – a channel
- **queuesize** (`int`) – The queuesize for storing messages in `IRCCClient.messages`. If 0, unlimited size.

**Raises** `exceptions.NotAuthorizedError`

**Methods**

<code>__init__(session, channel[, queuesize])</code>	Initialize a new irc client which can connect to the given channel.
<code>action(*args, **kwargs)</code>	Send a CTCP ACTION command.
<code>admin(*args, **kwargs)</code>	Send an ADMIN command.
<code>cap(*args, **kwargs)</code>	Send a CAP command according to <a href="#">the spec</a> .
<code>connect(*args, **kwargs)</code>	Connect using the underlying connection
<code>ctcp(*args, **kwargs)</code>	Send a CTCP command.
<code>ctcp_reply(*args, **kwargs)</code>	Send a CTCP REPLY command.
<code>dcc_connect(address, port[, dcctype])</code>	Connect to a DCC peer.
<code>dcc_listen([dcctype])</code>	Listen for connections from a DCC peer.
<code>globops(*args, **kwargs)</code>	Send a GLOBOPS command.
<code>info(*args, **kwargs)</code>	Send an INFO command.
<code>invite(*args, **kwargs)</code>	Send an INVITE command.
<code>ison(*args, **kwargs)</code>	Send an ISON command.
<code>join(*args, **kwargs)</code>	Send a JOIN command.
<code>kick(*args, **kwargs)</code>	Send a KICK command.
<code>links(*args, **kwargs)</code>	Send a LINKS command.
<code>list(*args, **kwargs)</code>	Send a LIST command.
<code>lusers(*args, **kwargs)</code>	Send a LUSERS command.
<code>mode(*args, **kwargs)</code>	Send a MODE command.
<code>motd(*args, **kwargs)</code>	Send an MOTD command.
<code>names(*args, **kwargs)</code>	Send a NAMES command.
<code>negotiate_capabilities(connection)</code>	Send <code>IRCCClient.capabilities</code> to the server.
<code>nick(*args, **kwargs)</code>	Send a NICK command.
<code>notice(*args, **kwargs)</code>	Send a NOTICE command.
<code>on_privmsg(connection, event)</code>	Handle the private message event
<code>on_pubmsg(connection, event)</code>	Handle the public message event
<code>on_welcome(connection, event)</code>	Handle the welcome event
<code>oper(*args, **kwargs)</code>	Send an OPER command.

Continued on next page

Table 2.3 – continued from previous page

<code>part(*args, **kwargs)</code>	Send a PART command.
<code>pass_(*args, **kwargs)</code>	Send a PASS command.
<code>ping(*args, **kwargs)</code>	Send a PING command.
<code>pong(*args, **kwargs)</code>	Send a PONG command.
<code>privmsg(*args, **kwargs)</code>	Send a PRIVMSG command.
<code>privmsg_many(*args, **kwargs)</code>	Send a PRIVMSG command to multiple targets.
<code>quit(*args, **kwargs)</code>	Send a QUIT command.
<code>send_msg(message)</code>	Send the given message to the channel
<code>send_raw(*args, **kwargs)</code>	Send raw string to the server.
<code>squit(*args, **kwargs)</code>	Send an SQUIT command.
<code>start()</code>	Start the IRC client.
<code>stats(*args, **kwargs)</code>	Send a STATS command.
<code>store_message(connection, event)</code>	Store the message of event in <code>IRCCClient.messages</code> .
<code>time(*args, **kwargs)</code>	Send a TIME command.
<code>topic(*args, **kwargs)</code>	Send a TOPIC command.
<code>trace(*args, **kwargs)</code>	Send a TRACE command.
<code>user(*args, **kwargs)</code>	Send a USER command.
<code>userhost(*args, **kwargs)</code>	Send a USERHOST command.
<code>users(*args, **kwargs)</code>	Send a USERS command.
<code>version(*args, **kwargs)</code>	Send a VERSION command.
<code>wallops(*args, **kwargs)</code>	Send a WALLOPS command.
<code>who(*args, **kwargs)</code>	Send a WHO command.
<code>whois(*args, **kwargs)</code>	Send a WHOIS command.
<code>whowas(*args, **kwargs)</code>	Send a WHOWAS command.

## Attributes

<code>capabilities</code>	List of irc capabilities
<code>channel</code>	The channel to connect to.

### `reactor_class`

The reactor class which dispatches events

alias of `Reactor3`

### `capabilities = [':twitch.tv/membership', ':twitch.tv/commands', ':twitch.tv/tags']`

List of irc capabilities

### `in_connection = None`

Connection that receives messages

### `out_connection = None`

Connection that sends messages

### `session = None`

an authenticated session. Used for querying the right server and the login username.

### `login_user = None`

The user that is used for logging in to the chat

### `shutdown = None`

Call this method for shutting down the client. This is thread safe.

**process\_forever = None**

Call this method to process messages until shutdown() is called.

**Parameters** `timeout` (`float`) – timeout for waiting on data in seconds

**messages = None**

A queue which stores all private and public `pytwitcherapi.chat.message.Message3`. Useful for accessing messages from another thread.

**channel**

The channel to connect to. When setting the channel, automatically connect to it. If channel is None, disconnect.

**on\_welcome (connection, event)**

Handle the welcome event

Automatically join the channel.

**Parameters**

- `connection` (`irc.client.ServerConnection`) – the connection with the event
- `event` (`irc.client.Event`) – the event to handle

**Returns** None

**negotiate\_capabilities (connection)**

Send `IRCClient.capabilities` to the server.

**Parameters** `connection` (`irc.client.ServerConnection`) – the connection to use for sending

**Returns** None

**Return type** None

**Raises** None

**store\_message (connection, event)**

Store the message of event in `IRCClient.messages`.

**Parameters**

- `connection` (`irc.client.ServerConnection`) – the connection with the event
- `event` (`irc.client.Event`) – the event to handle

**Returns** None

**on\_pubmsg (connection, event)**

Handle the public message event

This stores the message in `IRCClient.messages` via `IRCClient.store_message()`.

**Parameters**

- `connection` (`irc.client.ServerConnection`) – the connection with the event
- `event` (`irc.client.Event`) – the event to handle

**Returns** None

**on\_privmsg (connection, event)**

Handle the private message event

This stores the message in `IRCClient.messages` via `IRCClient.store_message()`.

**Parameters**

- **connection** (`irc.client.ServerConnection`) – the connection with the event
- **event** (`irc.client.Event`) – the event to handle

**Returns** None

**send\_msg** (`message`)

Send the given message to the channel

This is a convenience method for `IRCClient.privmsg()`, which uses the current channel as target. This method is thread safe and can be called from another thread even if the client is running in `IRCClient.process_forever()`.

**Parameters** `message` (`str`) – The message to send

**Returns** None

**Return type** `None`

**Raises** None

**action** (\*`args`, \*\*`kwargs`)

Send a CTCP ACTION command.

**admin** (\*`args`, \*\*`kwargs`)

Send an ADMIN command.

**cap** (\*`args`, \*\*`kwargs`)

Send a CAP command according to [the spec](#).

Arguments:

subcommand – LS, LIST, REQ, ACK, CLEAR, END  
args – capabilities, if required for given subcommand

Example:

```
.cap('LS') .cap('REQ', 'multi-prefix', 'sasl') .cap('END')
```

**ctcp** (\*`args`, \*\*`kwargs`)

Send a CTCP command.

**ctcp\_reply** (\*`args`, \*\*`kwargs`)

Send a CTCP REPLY command.

**globops** (\*`args`, \*\*`kwargs`)

Send a GLOBOPS command.

**info** (\*`args`, \*\*`kwargs`)

Send an INFO command.

**invite** (\*`args`, \*\*`kwargs`)

Send an INVITE command.

**ison** (\*`args`, \*\*`kwargs`)

Send an ISON command.

Arguments:

nicks – List of nicks.

**join** (\*`args`, \*\*`kwargs`)

Send a JOIN command.

**kick** (\*`args`, \*\*`kwargs`)

Send a KICK command.

**links** (\*args, \*\*kwargs)  
Send a LINKS command.

**list** (\*args, \*\*kwargs)  
Send a LIST command.

**lusers** (\*args, \*\*kwargs)  
Send a LUSERS command.

**mode** (\*args, \*\*kwargs)  
Send a MODE command.

**motd** (\*args, \*\*kwargs)  
Send an MOTD command.

**names** (\*args, \*\*kwargs)  
Send a NAMES command.

**nick** (\*args, \*\*kwargs)  
Send a NICK command.

**notice** (\*args, \*\*kwargs)  
Send a NOTICE command.

**oper** (\*args, \*\*kwargs)  
Send an OPER command.

**part** (\*args, \*\*kwargs)  
Send a PART command.

**pass\_** (\*args, \*\*kwargs)  
Send a PASS command.

**ping** (\*args, \*\*kwargs)  
Send a PING command.

**pong** (\*args, \*\*kwargs)  
Send a PONG command.

**privmsg** (\*args, \*\*kwargs)  
Send a PRIVMSG command.

**privmsg\_many** (\*args, \*\*kwargs)  
Send a PRIVMSG command to multiple targets.

**quit** (\*args, \*\*kwargs)  
Send a QUIT command.

**send\_raw** (\*args, \*\*kwargs)  
Send raw string to the server.  
The string will be padded with appropriate CR LF.

**squit** (\*args, \*\*kwargs)  
Send an SQUIT command.

**stats** (\*args, \*\*kwargs)  
Send a STATS command.

**time** (\*args, \*\*kwargs)  
Send a TIME command.

**topic** (\*args, \*\*kwargs)  
Send a TOPIC command.

```
trace(*args, **kwargs)
    Send a TRACE command.

user(*args, **kwargs)
    Send a USER command.

userhost(*args, **kwargs)
    Send a USERHOST command.

users(*args, **kwargs)
    Send a USERS command.

version(*args, **kwargs)
    Send a VERSION command.

wallops(*args, **kwargs)
    Send a WALLOPS command.

who(*args, **kwargs)
    Send a WHO command.

whois(*args, **kwargs)
    Send a WHOIS command.

whowas(*args, **kwargs)
    Send a WHOWAS command.
```

## **pytwitcherapi.chat.client.Reactor**

```
class pytwitcherapi.chat.client.Reactor(on_connect=<function __do_nothing>,
                                         on_disconnect=<function __do_nothing>)
Bases: irc.client.Reactor
```

Reactor that can exit the process\_forever loop.

The reactor is responsible for managing the connections, and handling the events that come in to the connections.

Simply call `Reactor.shutdown()` while the reactor is in a loop.

For more information see `irc.client.Reactor`.

```
__init__(on_connect=<function __do_nothing>, on_disconnect=<function __do_nothing>)
    Initialize a reactor.
```

### Parameters

- **on\_connect** – optional callback invoked when a new connection is made.
- **on\_disconnect** – optional callback invoked when a socket is disconnected.

### Methods

---

<code><u>__init__</u>([on_connect, on_disconnect])</code>	Initialize a reactor.
<code>add_global_handler(event, handler[, priority])</code>	Adds a global handler function for a specific event type.
<code>dcc([dcctype])</code>	Creates and returns a DCCConnection object.
<code>disconnect_all([message])</code>	Disconnects all connections.
<code>process_data(sockets)</code>	Called when there is more data to read on connection sockets.

---

Continued on next page

Table 2.5 – continued from previous page

<code>process_forever([timeout])</code>	Run an infinite loop, processing data from connections.
<code>process_once([timeout])</code>	Process data from connections once.
<code>process_timeout()</code>	Called when a timeout notification is due.
<code>remove_global_handler(event, handler)</code>	Removes a global handler function.
<code>server()</code>	Creates and returns a ServerConnection object.
<code>shutdown()</code>	Disconnect all connections and end the loop

## Attributes

---

sockets

---

### `process_forever(timeout=0.2)`

Run an infinite loop, processing data from connections.

This method repeatedly calls `process_once`.

**Parameters** `timeout` (`float`) – Parameter to pass to `irc.client.Reactor.process_once()`

### `shutdown()`

Disconnect all connections and end the loop

**Returns** `None`

**Return type** `None`

**Raises** `None`

## pytwitcherapi.chat.client.Reactor3

`class pytwitcherapi.chat.client.Reactor3(on_connect=<function __do_nothing>, on_disconnect=<function __do_nothing>)`

Bases: `pytwitcherapi.chat.client.Reactor`

Reactor that uses irc v3 connections

Uses the `ServerConnection3` class for connections. They support Event 3 with tags.

`__init__(on_connect=<function __do_nothing>, on_disconnect=<function __do_nothing>)`  
Initialize a reactor.

**Parameters**

- `on_connect` – optional callback invoked when a new connection is made.
- `on_disconnect` – optional callback invoked when a socket is disconnected.

## Methods

<code>__init__([on_connect, on_disconnect])</code>	Initialize a reactor.
<code>add_global_handler(event, handler[, priority])</code>	Adds a global handler function for a specific event type.
<code>dcc([dcctype])</code>	Creates and returns a DCCConnection object.
<code>disconnect_all([message])</code>	Disconnects all connections.

Continued on next page

Table 2.7 – continued from previous page

<code>process_data(sockets)</code>	Called when there is more data to read on connection sockets.
<code>process_forever([timeout])</code>	Run an infinite loop, processing data from connections.
<code>process_once([timeout])</code>	Process data from connections once.
<code>process_timeout()</code>	Called when a timeout notification is due.
<code>remove_global_handler(event, handler)</code>	Removes a global handler function.
<code>server()</code>	Creates and returns a ServerConnection
<code>shutdown()</code>	Disconnect all connections and end the loop

## Attributes

---

`sockets`

---

**server()**

Creates and returns a ServerConnection

**Returns** a server connection

**Return type** `connection.ServerConnection3`

**Raises** None

## Functions

---

<code>add_serverconnection_methods(cls)</code>	Add a bunch of methods to an <code>irc.client.SimpleIRCClient</code> to send commands and messages.
--	---

---

## Data

---

<code>absolute_import</code>	
<code>log</code>	Instances of the Logger class represent a single logging channel.

---

`pytwitcherapi.chat.client.add_serverconnection_methods(cls)`

Add a bunch of methods to an `irc.client.SimpleIRCClient` to send commands and messages.

Basically it wraps a bunch of methdos from `irc.client.ServerConnection` to be `irc.schedule.IScheduler.execute_after()`. That way, you can easily send, even if the IRCClient is running in `IRCClient.process_forever` in another thread.

On the plus side you can use positional and keyword arguments instead of just positional ones.

**Parameters** `cls` (`irc.client.SimpleIRCClient`) – The class to add the methods do.

**Returns** None

`pytwitcherapi.chat.client.absolute_import = _Feature((2, 5, 0, 'alpha', 1), (3, 0, 0, 'alpha', 0), 16384)`

`pytwitcherapi.chat.client.log = <logging.Logger object>`

Instances of the Logger class represent a single logging channel. A “logging channel” indicates an area of an application. Exactly how an “area” is defined is up to the application developer. Since an application can have

any number of areas, logging channels are identified by a unique string. Application areas can be nested (e.g. an area of “input processing” might include sub-areas “read CSV files”, “read XLS files” and “read Gnumeric files”). To cater for this natural nesting, channel names are organized into a namespace hierarchy where levels are separated by periods, much like the Java or Python package namespace. So in the instance given above, channel names might be “input” for the upper level, and “input.csv”, “input.xls” and “input.gnu” for the sub-levels. There is no arbitrary limit to the depth of nesting.

## pytwitcherapi.chat.connection

### Classes

<code>Event3</code> (type, source, target[, arguments, tags])	An IRC event with tags
<code>ServerConnection3</code> (reactor[, msglimit, ...])	ServerConncetion that can handle irc v3 tags

## pytwitcherapi.chat.connection.Event3

```
class pytwitcherapi.chat.connection.Event3 (type, source, target, arguments=None, tags=None)
```

Bases: `irc.client.Event`

An IRC event with tags

See `tag` specification.

```
__init__(type, source, target, arguments=None, tags=None)
```

Initialize a new event

#### Parameters

- `type` (`str`) – a string describing the event
- `source` (`irc.client.NickMask | str`) – The originator of the event. NickMask or server
- `target` (`str`) – The target of the event
- `arguments` (`list | None`) – Any specific event arguments

`Raises` `None`

#### Methods

---

```
__init__(type, source, target[, arguments, tags]) Initialize a new event
```

## pytwitcherapi.chat.connection.ServerConnection3

```
class pytwitcherapi.chat.connection.ServerConnection3 (reactor, msglimit=20, limitinterval=30)
```

Bases: `irc.client.ServerConnection`

ServerConncetion that can handle irc v3 tags

Tags are only handled for privmsg, pubmsg, notice events. All other events might be handled the old way.

**`__init__(reactor, msglimit=20, limitinterval=30)`**

Initialize a connection that has a limit to sending messages

**Parameters**

- **reactor** (`irc.client.Reactor`) – the reactor of the connection
- **msglimit** (`int`) – the maximum number of messages to send in limitinterval
- **limitinterval** (`int`) – the timeframe in seconds in which you can only send as many messages as in msglimit

**Raises** None**Methods**

<code>__init__(reactor[, msglimit, limitinterval])</code>	Initialize a connection that has a limit to sending messages
<code>action(target, action)</code>	Send a CTCP ACTION command.
<code>add_global_handler(*args)</code>	Add global handler.
<code>admin([server])</code>	Send an ADMIN command.
<code>as_nick(*args, **kwds)</code>	Set the nick for the duration of the context.
<code>cap(subcommand, *args)</code>	Send a CAP command according to <a href="#">the spec</a> .
<code>close()</code>	Close the connection.
<code>connect(*args, **kwargs)</code>	Connect/reconnect to a server.
<code>ctcp(ctctype, target[, parameter])</code>	Send a CTCP command.
<code>ctcp_reply(target, parameter)</code>	Send a CTCP REPLY command.
<code>disconnect([message])</code>	Hang up the connection.
<code>get_nickname()</code>	Get the (real) nick name.
<code>get_server_name()</code>	Get the (real) server name.
<code>get_waittime()</code>	Return the appropriate time to wait, if we sent too many messages
<code>globops(text)</code>	Send a GLOBOPS command.
<code>info([server])</code>	Send an INFO command.
<code>invite(nick, channel)</code>	Send an INVITE command.
<code>is_connected()</code>	Return connection status.
<code>ison(nicks)</code>	Send an ISON command.
<code>join(channel[, key])</code>	Send a JOIN command.
<code>kick(channel, nick[, comment])</code>	Send a KICK command.
<code>links([remote_server, server_mask])</code>	Send a LINKS command.
<code>list([channels, server])</code>	Send a LIST command.
<code>lusers([server])</code>	Send a LUSERS command.
<code>mode(target, command)</code>	Send a MODE command.
<code>motd([server])</code>	Send an MOTD command.
<code>names([channels])</code>	Send a NAMES command.
<code>nick(newnick)</code>	Send a NICK command.
<code>notice(target, text)</code>	Send a NOTICE command.
<code>oper(nick, password)</code>	Send an OPER command.
<code>part(channels[, message])</code>	Send a PART command.
<code>pass_(password)</code>	Send a PASS command.
<code>ping(target[, target2])</code>	Send a PING command.
<code>pong(target[, target2])</code>	Send a PONG command.
<code>privmsg(target, text)</code>	Send a PRIVMSG command.

Continued on next page

Table 2.13 – continued from previous page

<code>privmsg_many(targets, text)</code>	Send a PRIVMSG command to multiple targets.
<code>process_data()</code>	read and process input from <code>self.socket</code>
<code>quit([message])</code>	Send a QUIT command.
<code>reconnect()</code>	Reconnect with the last arguments passed to <code>self.connect()</code>
<code>remove_global_handler(*args)</code>	Remove global handler.
<code>send_items(*items)</code>	Send all non-empty items, separated by spaces.
<code>send_raw(string)</code>	Send raw string to the server.
<code>set_keepalive(interval)</code>	Set a keepalive to occur every <code>interval</code> on this connection.
<code>set_rate_limit(frequency)</code>	Set a <code>frequency</code> limit (messages per second) for this connection.
<code>squit(server[, comment])</code>	Send an SQUIT command.
<code>stats(statstype[, server])</code>	Send a STATS command.
<code>time([server])</code>	Send a TIME command.
<code>topic(channel[, new_topic])</code>	Send a TOPIC command.
<code>trace([target])</code>	Send a TRACE command.
<code>user(username, realname)</code>	Send a USER command.
<code>userhost(nicks)</code>	Send a USERHOST command.
<code>users([server])</code>	Send a USERS command.
<code>version([server])</code>	Send a VERSION command.
<code>wallops(text)</code>	Send a WALLOPS command.
<code>who([target, op])</code>	Send a WHO command.
<code>whois(targets)</code>	Send a WHOIS command.
<code>whowas(nick[, max, server])</code>	Send a WHOWAS command.

## Attributes

---

`socket`

---

**`sentmessages = None`**

A queue with timestamps form the last sent messages. So we can track if we send to many messages.

**`limitinterval = None`**

the timeframe in seconds in which you can only send as many messages as in `ServerConnection3msglimit`

**`get_waittime()`**

Return the appropriate time to wait, if we sent too many messages

**Returns** the time to wait in seconds

**Return type** `float`

**Raises** `None`

**`send_raw(string)`**

Send raw string to the server.

The string will be padded with appropriate CR LF. If too many messages are sent, this will call `time.sleep()` until it is allowed to send messages again.

**Parameters** `string (str)` – the raw string to send

**Returns** None

**Raises** `irc.client.InvalidCharacters`, `irc.client.MessageTooLong`, `irc.client.ServerNotConnectedError`

## Data

---

<code>log</code>	Instances of the <code>Logger</code> class represent a single logging channel.
------------------	--

---

### `pytwitcherapi.chat.connection.log = <logging.Logger object>`

Instances of the `Logger` class represent a single logging channel. A “logging channel” indicates an area of an application. Exactly how an “area” is defined is up to the application developer. Since an application can have any number of areas, logging channels are identified by a unique string. Application areas can be nested (e.g. an area of “input processing” might include sub-areas “read CSV files”, “read XLS files” and “read Gnumeric files”). To cater for this natural nesting, channel names are organized into a namespace hierarchy where levels are separated by periods, much like the Java or Python package namespace. So in the instance given above, channel names might be “input” for the upper level, and “input.csv”, “input.xls” and “input.gnu” for the sub-levels. There is no arbitrary limit to the depth of nesting.

## `pytwitcherapi.chat.message`

### Classes

---

<code>Chatter(source)</code>	A chat user object
<code>Emote(emoteid, occurrences)</code>	Emote from the emotes tag
<code>Message(source, target, text)</code>	A message object
<code>Message3(source, target, text[, tags])</code>	A message which stores information from irc v3 tags
<code>Tag(name[, value, vendor])</code>	An irc v3 tag

---

### `pytwitcherapi.chat.message.Chatter`

`class pytwitcherapi.chat.message.Chatter(source)`  
Bases: `object`

A chat user object

Stores information about a chat user (source of an ircevent).

See `irc.client.NickMask` for how the attributes are constructed.

`__init__(source)`

Initialize a new chatter

**Parameters** `source` – the source of an `irc.client.Event`. E.g. ‘pinky! username@example.com’

**Raises** None

### Methods

---

<code>__init__(source)</code>	Initialize a new chatter
-------------------------------	--------------------------

---

**full = None**

The full name (nickname!user@host)

**nickname = None**

The irc nickname

**user = None**

The irc user

**host = None**

The irc host

**userhost = None**

The irc user @ irc host

**pytwitcherapi.chat.message.Emote**

**class** pytwitcherapi.chat.message.Emote (*emoteid, occurrences*)  
Bases: `object`

Emote from the emotes tag

An emote has an id and occurrences in a message. So each emote is tied to a specific message.

You can get the pictures here:

```
``cdn.jtvnw.net/emoticons/v1/<emoteid>/1.0``
```

**\_\_init\_\_(emoteid, occurrences)**

Initialize a new emote

**Parameters**

- **emoteid** (`int`) – The emote id
- **occurrences** (`list`) – a list of occurrences, e.g. `[(0, 4), (8, 12)]`

**Raises** None**Methods**

---

<code>__init__(emoteid, occurrences)</code>	Initialize a new emote
<code>from_str(emotestr)</code>	Create an emote from the emote tag key

---

**emoteid = None**

The emote identifier

**occurrences = None**

A list of occurrences, e.g. `[(0, 4), (8, 12)]`

**classmethod from\_str(emotestr)**

Create an emote from the emote tag key

**Parameters** `emotestr` (`str`) – the tag key, e.g. `'123:0-4'`

**Returns** an emote

**Return type** [Emote](#)

**Raises** None

## [pytwitcherapi.chat.message.Message](#)

**class** [pytwitcherapi.chat.message.Message](#) (*source, target, text*)

Bases: [object](#)

A messag object

Can be a private/public message from a server or user.

**\_\_init\_\_** (*source, target, text*)

Initialize a new message from source to target with the given text

**Parameters**

- **source** ([Chatter](#)) – The source chatter
- **target** ([str](#)) – the target
- **text** ([str](#)) – the content of the message

**Raises** None

### Methods

---

**\_\_init\_\_**(*source, target, text*)

Initialize a new message from source to target with the given text

---

## [pytwitcherapi.chat.message.Message3](#)

**class** [pytwitcherapi.chat.message.Message3](#) (*source, target, text, tags=None*)

Bases: [pytwitcherapi.chat.message.Message](#)

A message which stores information from irc v3 tags

**\_\_init\_\_** (*source, target, text, tags=None*)

Initialize a new message from source to target with the given text

**Parameters**

- **source** ([Chatter](#)) – The source chatter
- **target** ([str](#)) – the target
- **text** ([str](#)) – the content of the message
- **tags** (list of [Tag](#)) – the irc v3 tags

**Raises** None

### Methods

---

<code>__init__(source, target, text[, tags])</code>	Initialize a new message from source to target with the given text
<code>from_event(event)</code>	Create a message from an event
<code>set_tags(tags)</code>	For every known tag, set the appropriate attribute.

---

## Attributes

---

<code>emotes</code>	Return the emotes
<code>subscriber</code>	Return whether the message was sent from a subscriber
<code>turbo</code>	Return whether the message was sent from a turbo user

---

### `color = None`

the hex representation of the user color

### `user_type = None`

Turbo type. None for regular ones. Other user types are mod, global\_mod, staff, admin.

### `classmethod from_event(event)`

Create a message from an event

**Parameters** `event` (Event3) – the event that was received of type pubmsg or privmsg

**Returns** a message that resembles the event

**Return type** `Message3`

**Raises** None

### `set_tags(tags)`

For every known tag, set the appropriate attribute.

Known tags are:

`color` The user color

`emotes` A list of emotes

`subscriber` True, if subscriber

`turbo` True, if turbo user

`user_type` None, mod, staff, global\_mod, admin

**Parameters** `tags` (list of `Tag` | None) – a list of tags

**Returns** None

**Return type** `None`

**Raises** None

### `emotes`

Return the emotes

**Returns** the emotes

**Return type** list

**Raises** None

**subscriber**

Return whether the message was sent from a subscriber

**Returns** True, if subscriber

**Return type** `bool`

**Raises** None

**turbo**

Return whether the message was sent from a turbo user

**Returns** True, if turbo

**Return type** `bool`

**Raises** None

## pytwitcherapi.chat.message.Tag

`class pytwitcherapi.chat.message.Tag(name, value=None, vendor=None)`

Bases: `object`

An irc v3 tag

Specification for tags. A tag will associate metadata with a message.

To get tags in twitch chat, you have to specify it in the **'capability negotiation<<http://ircv3.net/specs/core/capability-negotiation-3.1.html>>'**.

`__init__(name, value=None, vendor=None)`

Initialize a new tag called name

**Parameters**

- **name** (`str`) – The name of the tag
- **value** (`str` | `None`) – The value of a tag
- **vendor** (`str` | `tag`) – the vendor for vendor specific tags

**Raises** None

## Methods

---

`__init__(name[, value, vendor])`

Initialize a new tag called name

`from_str(tagstring)`

Create a tag by parsing the tag of a message

---

**classmethod from\_str(tagstring)**

Create a tag by parsing the tag of a message

**Parameters** `tagstring` (`str`) – A tag string described in the irc protocol

**Returns** A tag

**Return type** `Tag`

**Raises** None

## Module contents

Package for interacting with the IRC chat of a channel.

The main client for connecting to the channel is `IRCClient`.

## Classes

<code>IRCClient(session, channel[, queuesize])</code>	Simple IRC client which can connect to a single pytwitcherapi.Channel.
---	--

### pytwitcherapi.chat.IRCClient

`class pytwitcherapi.chat.IRCClient(session, channel, queuesize=100)`  
Bases: `irc.client.SimpleIRCClient`

Simple IRC client which can connect to a single pytwitcherapi.Channel.

You need an authenticated session with scope `chat_login`. Call `IRCClient.process_forever()` to start the event loop. This will block the current thread though. Calling `IRCClient.shutdown()` will stop the loop.

There are a lot of methods that can make the client send commands while the client is in its event loop. These methods are wrapped ones of `irc.client.ServerConnection`. They will always use `IRCClient.out_connection`!

You can implement handlers for all sorts of events by subclassing and creating a method called `on_<event_type>`. Note that `IRCClient.out_connection` will only get to the `IRCClient.on_welcome()` event (and then join a channel) and the `IRCClient.on_join()` event. For all other events, the `IRCClient.in_connection` will handle it and the other one will ignore it. This behaviour is implemented in `IRCClient._dispatcher()`

Little example with threads. Change input to `raw_input` for python 2:

```
import threading

from pytwitcherapi import chat

session = ... # we assume an authenticated TwitchSession
channel = session.get_channel('somechannel')
client = chat.IRCClient(session, channel)
t = threading.Thread(target=client.process_forever,
                      kwargs={'timeout': 0.2})
t.start()

try:
    while True:
        m = input('Send Message:')
        if not m: break;
        # will be processed in other thread
        client.send_msg(m)
finally:
    client.shutdown()
    t.join()
```

### `__init__(session, channel, queuesize=100)`

Initialize a new irc client which can connect to the given channel.

#### Parameters

- **session** (`pytwitcherapi.TwitchSession`) – a authenticated session. Used for querying the right server and the login username.
- **channel** (`pytwitcherapi.Channel`) – a channel
- **queuesize** (`int`) – The queuesize for storing messages in `IRCClient.messages`. If 0, unlimited size.

**Raises** `exceptions.NotAuthorizedError`

## Methods

<code>__init__(session, channel[, queuesize])</code>	Initialize a new irc client which can connect to the given channel.
<code>action(*args, **kwargs)</code>	Send a CTCP ACTION command.
<code>admin(*args, **kwargs)</code>	Send an ADMIN command.
<code>cap(*args, **kwargs)</code>	Send a CAP command according to the spec.
<code>connect(*args, **kwargs)</code>	Connect using the underlying connection
<code>ctcp(*args, **kwargs)</code>	Send a CTCP command.
<code>ctcp_reply(*args, **kwargs)</code>	Send a CTCP REPLY command.
<code>dcc_connect(address, port[, dcctype])</code>	Connect to a DCC peer.
<code>dcc_listen([dcctype])</code>	Listen for connections from a DCC peer.
<code>globops(*args, **kwargs)</code>	Send a GLOBOPS command.
<code>info(*args, **kwargs)</code>	Send an INFO command.
<code>invite(*args, **kwargs)</code>	Send an INVITE command.
<code>ison(*args, **kwargs)</code>	Send an ISON command.
<code>join(*args, **kwargs)</code>	Send a JOIN command.
<code>kick(*args, **kwargs)</code>	Send a KICK command.
<code>links(*args, **kwargs)</code>	Send a LINKS command.
<code>list(*args, **kwargs)</code>	Send a LIST command.
<code>lusers(*args, **kwargs)</code>	Send a LUSERS command.
<code>mode(*args, **kwargs)</code>	Send a MODE command.
<code>motd(*args, **kwargs)</code>	Send an MOTD command.
<code>names(*args, **kwargs)</code>	Send a NAMES command.
<code>negotiate_capabilities(connection)</code>	Send <code>IRCClient.capabilities</code> to the server.
<code>nick(*args, **kwargs)</code>	Send a NICK command.
<code>notice(*args, **kwargs)</code>	Send a NOTICE command.
<code>on_privmsg(connection, event)</code>	Handle the private message event
<code>on_pubmsg(connection, event)</code>	Handle the public message event
<code>on_welcome(connection, event)</code>	Handle the welcome event
<code>oper(*args, **kwargs)</code>	Send an OPER command.
<code>part(*args, **kwargs)</code>	Send a PART command.
<code>pass_(*args, **kwargs)</code>	Send a PASS command.
<code>ping(*args, **kwargs)</code>	Send a PING command.
<code>pong(*args, **kwargs)</code>	Send a PONG command.
<code>privmsg(*args, **kwargs)</code>	Send a PRIVMSG command.
<code>privmsg_many(*args, **kwargs)</code>	Send a PRIVMSG command to multiple targets.
<code>quit(*args, **kwargs)</code>	Send a QUIT command.

Continued on next page

Table 2.24 – continued from previous page

<code>send_msg(message)</code>	Send the given message to the channel
<code>send_raw(*args, **kwargs)</code>	Send raw string to the server.
<code>squit(*args, **kwargs)</code>	Send an SQUIT command.
<code>start()</code>	Start the IRC client.
<code>stats(*args, **kwargs)</code>	Send a STATS command.
<code>store_message(connection, event)</code>	Store the message of event in <code>IRCClient.messages</code> .
<code>time(*args, **kwargs)</code>	Send a TIME command.
<code>topic(*args, **kwargs)</code>	Send a TOPIC command.
<code>trace(*args, **kwargs)</code>	Send a TRACE command.
<code>user(*args, **kwargs)</code>	Send a USER command.
<code>userhost(*args, **kwargs)</code>	Send a USERHOST command.
<code>users(*args, **kwargs)</code>	Send a USERS command.
<code>version(*args, **kwargs)</code>	Send a VERSION command.
<code>wallops(*args, **kwargs)</code>	Send a WALLOPS command.
<code>who(*args, **kwargs)</code>	Send a WHO command.
<code>whois(*args, **kwargs)</code>	Send a WHOIS command.
<code>whowas(*args, **kwargs)</code>	Send a WHOWAS command.

## Attributes

<code>capabilities</code>	List of irc capabilities
<code>channel</code>	The channel to connect to.

### `reactor_class`

The reactor class which dispatches events

alias of `Reactor3`

### `capabilities = [':twitch.tv/membership', ':twitch.tv/commands', ':twitch.tv/tags']`

List of irc capabilities

### `in_connection = None`

Connection that receives messages

### `out_connection = None`

Connection that sends messages

### `session = None`

an authenticated session. Used for querying the right server and the login username.

### `login_user = None`

The user that is used for logging in to the chat

### `shutdown = None`

Call this method for shutting down the client. This is thread safe.

### `process_forever = None`

Call this method to process messages until shutdown() is called.

**Parameters** `timeout (float)` – timeout for waiting on data in seconds

### `messages = None`

A queue which stores all private and public `pytwitcherapi.chat.message.Message3`. Useful for accessing messages from another thread.

**channel**

The channel to connect to. When setting the channel, automatically connect to it. If channel is None, disconnect.

**on\_welcome** (*connection, event*)

Handle the welcome event

Automatically join the channel.

**Parameters**

- **connection** (`irc.client.ServerConnection`) – the connection with the event
- **event** (`irc.client.Event`) – the event to handle

**Returns** None

**negotiate\_capabilities** (*connection*)

Send `IRCClient.capabilities` to the server.

**Parameters** **connection** (`irc.client.ServerConnection`) – the connection to use for sending

**Returns** None

**Return type** None

**Raises** None

**store\_message** (*connection, event*)

Store the message of event in `IRCClient.messages`.

**Parameters**

- **connection** (`irc.client.ServerConnection`) – the connection with the event
- **event** (`irc.client.Event`) – the event to handle

**Returns** None

**on\_pubmsg** (*connection, event*)

Handle the public message event

This stores the message in `IRCClient.messages` via `IRCClient.store_message()`.

**Parameters**

- **connection** (`irc.client.ServerConnection`) – the connection with the event
- **event** (`irc.client.Event`) – the event to handle

**Returns** None

**on\_privmsg** (*connection, event*)

Handle the private message event

This stores the message in `IRCClient.messages` via `IRCClient.store_message()`.

**Parameters**

- **connection** (`irc.client.ServerConnection`) – the connection with the event
- **event** (`irc.client.Event`) – the event to handle

**Returns** None

**send\_msg**(*message*)

Send the given message to the channel

This is a convenience method for `IRCClient.privmsg()`, which uses the current channel as target. This method is thread safe and can be called from another thread even if the client is running in `IRCClient.process_forever()`.

**Parameters** `message` (`str`) – The message to send

**Returns** None

**Return type** `None`

**Raises** None

**action**(\*args, \*\*kwargs)

Send a CTCP ACTION command.

**admin**(\*args, \*\*kwargs)

Send an ADMIN command.

**cap**(\*args, \*\*kwargs)

Send a CAP command according to the spec.

Arguments:

subcommand – LS, LIST, REQ, ACK, CLEAR, END  
args – capabilities, if required for given subcommand

Example:

```
.cap('LS') .cap('REQ', 'multi-prefix', 'sasl') .cap('END')
```

**ctcp**(\*args, \*\*kwargs)

Send a CTCP command.

**ctcp\_reply**(\*args, \*\*kwargs)

Send a CTCP REPLY command.

**globops**(\*args, \*\*kwargs)

Send a GLOBOPS command.

**info**(\*args, \*\*kwargs)

Send an INFO command.

**invite**(\*args, \*\*kwargs)

Send an INVITE command.

**ison**(\*args, \*\*kwargs)

Send an ISON command.

Arguments:

nicks – List of nicks.

**join**(\*args, \*\*kwargs)

Send a JOIN command.

**kick**(\*args, \*\*kwargs)

Send a KICK command.

**links**(\*args, \*\*kwargs)

Send a LINKS command.

**list**(\*args, \*\*kwargs)

Send a LIST command.

**lusers** (\*args, \*\*kwargs)  
Send a LUSERS command.

**mode** (\*args, \*\*kwargs)  
Send a MODE command.

**motd** (\*args, \*\*kwargs)  
Send an MOTD command.

**names** (\*args, \*\*kwargs)  
Send a NAMES command.

**nick** (\*args, \*\*kwargs)  
Send a NICK command.

**notice** (\*args, \*\*kwargs)  
Send a NOTICE command.

**oper** (\*args, \*\*kwargs)  
Send an OPER command.

**part** (\*args, \*\*kwargs)  
Send a PART command.

**pass\_**(\*args, \*\*kwargs)  
Send a PASS command.

**ping** (\*args, \*\*kwargs)  
Send a PING command.

**pong** (\*args, \*\*kwargs)  
Send a PONG command.

**privmsg** (\*args, \*\*kwargs)  
Send a PRIVMSG command.

**privmsg\_many** (\*args, \*\*kwargs)  
Send a PRIVMSG command to multiple targets.

**quit** (\*args, \*\*kwargs)  
Send a QUIT command.

**send\_raw** (\*args, \*\*kwargs)  
Send raw string to the server.  
The string will be padded with appropriate CR LF.

**squit** (\*args, \*\*kwargs)  
Send an SQUIT command.

**stats** (\*args, \*\*kwargs)  
Send a STATS command.

**time** (\*args, \*\*kwargs)  
Send a TIME command.

**topic** (\*args, \*\*kwargs)  
Send a TOPIC command.

**trace** (\*args, \*\*kwargs)  
Send a TRACE command.

**user** (\*args, \*\*kwargs)  
Send a USER command.

```
userhost(*args, **kwargs)
    Send a USERHOST command.

users(*args, **kwargs)
    Send a USERS command.

version(*args, **kwargs)
    Send a VERSION command.

wallops(*args, **kwargs)
    Send a WALLOPS command.

who(*args, **kwargs)
    Send a WHO command.

whois(*args, **kwargs)
    Send a WHOIS command.

whowas(*args, **kwargs)
    Send a WHOWAS command.
```

## Data

---

### *absolute\_import*

---

```
pytwitcherapi.chat.absolute_import = _Feature((2, 5, 0, 'alpha', 1), (3, 0, 0, 'alpha', 0), 16384)
```

## Submodules

### `pytwitcherapi.constants`

Collection of constants

These constants might be needed in multiple modules, so we pull them together here.

## Data

---

<code>LOGIN_SERVER_ADDRESS</code>	Server address of server that catches the redirection and the oauth token.
<code>REDIRECT_URI</code>	The redirect url of pytwitcher.

---

```
pytwitcherapi.constants.LOGIN_SERVER_ADDRESS = ('', 42420)
    Server address of server that catches the redirection and the oauth token.
```

```
pytwitcherapi.constants.REDIRECT_URI = 'http://localhost:42420'
    The redirect url of pytwitcher. We do not need to redirect anywhere so localhost is set in the twitch preferences of pytwitcher
```

### `pytwitcherapi.exceptions`

Collection exceptions

## Exceptions

<code>NotAuthorizedError</code>	Exception that is raised, when the session is not authorized.
<code>PytwitcherException</code>	Base exception for pytwitcher

### `pytwitcherapi.exceptions.NotAuthorizedError`

```
exception pytwitcherapi.exceptions.NotAuthorizedError
Bases: pytwitcherapi.exceptions.PytwitcherException
```

Exception that is raised, when the session is not authorized. The user has to login first

### `pytwitcherapi.exceptions.PytwitcherException`

```
exception pytwitcherapi.exceptions.PytwitcherException
Bases: exceptions.Exception
```

Base exception for pytwitcher

## `pytwitcherapi.models`

Contains classes that wrap the jsons returned by the twitch.tv API

## Classes

<code>Channel</code> (name, status, displayname, game, ...)	Channel on twitch.tv
<code>Game</code> (name, box, logo, twitchid[, viewers, ...])	Game on twitch.tv
<code>Stream</code> (game, channel, twitchid, viewers, preview)	A stream on twitch.tv
<code>User</code> (usertype, name, logo, twitchid, ...)	A user on twitch.tv

### `pytwitcherapi.models.Channel`

```
class pytwitcherapi.models.Channel(name, status, displayname, game, twitchid, views, followers,
url, language, broadcaster_language, mature, logo, banner,
video_banner, delay)
```

Bases: `object`

Channel on twitch.tv

```
__init__(name, status, displayname, game, twitchid, views, followers, url, language, broad-
caster_language, mature, logo, banner, video_banner, delay)
Initialize a new channel
```

#### Parameters

- `name` (`str`) – The name of the channel
- `status` (`str`) – The status
- `displayname` (`str`) – The name displayed by the interface
- `game` (`str`) – the game of the channel

- `twitchid` (`int`) – the internal twitch id
- `views` (`int`) – the overall views
- `followers` (`int`) – the follower count
- `url` (`str`) – the url to the channel
- `language` (`str`) – the language of the channel
- `broadcaster_language` (`str`) – the language of the broadcaster
- `mature` (`bool`) – If true, the channel is only for mature audiences
- `logo` (`str`) – the link to the logos
- `banner` (`str`) – the link to the banner
- `video_banner` (`str`) – the link to the video banner
- `delay` (`int`) – stream delay

**Raises** None

## Methods

<code>__init__(name, status, displayname, game, ...)</code>	Initialize a new channel
<code>wrap_get_channel(response)</code>	Wrap the response from getting a channel into an instance
<code>wrap_json(json)</code>	Create a Channel instance for the given json
<code>wrap_search(response)</code>	Wrap the response from a channel search into instances

### `classmethod wrap_search(response)`

Wrap the response from a channel search into instances and return them

**Parameters** `response` (`requests.Response`) – The response from searching a channel

**Returns** the new channel instances

**Return type** list of channel

**Raises** None

### `classmethod wrap_get_channel(response)`

Wrap the response from getting a channel into an instance and return it

**Parameters** `response` (`requests.Response`) – The response from getting a channel

**Returns** the new channel instance

**Return type** list of channel

**Raises** None

### `classmethod wrap_json(json)`

Create a Channel instance for the given json

**Parameters** `json` (`dict`) – the dict with the information of the channel

**Returns** the new channel instance

**Return type** `Channel`

**Raises** None

**name = None**  
The name of the channel

**status = None**  
The current status message

**displayname = None**  
The name displayed by the interface

**game = None**  
The game of the channel

**twitchid = None**  
The internal twitch id

**views = None**  
The overall views

**followers = None**  
The follower count

**url = None**  
the link to the channel page

**language = None**  
Language of the channel

**broadcaster\_language = None**  
Language of the broadcaster

**mature = None**  
If true, the channel is only for mature audiences

**logo = None**  
the link to the logo

**banner = None**  
the link to the banner

**video\_banner = None**  
the link to the video banner

**delay = None**  
stream delay

## pytwitcherapi.models.Game

**class** pytwitcherapi.models.Game(name, box, logo, twitchid, viewers=None, channels=None)

Bases: object

Game on twitch.tv

**\_\_init\_\_(name, box, logo, twitchid, viewers=None, channels=None)**

Initialize a new game

### Parameters

- **name** (`str`) – The name of the game
- **box** (`dict`) – Links for the box logos
- **logo** (`dict`) – Links for the game logo

- **twitchid** (`int`) – The id used by twitch
- **viewers** (`int`) – The current amount of viewers
- **channels** (`int`) – The current amount of channels

**Raises** None

## Methods

<code>__init__(name, box, logo, twitchid[, ...])</code>	Initialize a new game
<code>wrap_json(json[, viewers, channels])</code>	Create a Game instance for the given json
<code>wrap_search(response)</code>	Wrap the response from a game search into instances
<code>wrap_topgames(response)</code>	Wrap the response from querying the top games into instances

### **classmethod** `wrap_search(response)`

Wrap the response from a game search into instances and return them

**Parameters** `response` (`requests.Response`) – The response from searching a game

**Returns** the new game instances

**Return type** list of `Game`

**Raises** None

### **classmethod** `wrap_topgames(response)`

Wrap the response from querying the top games into instances and return them

**Parameters** `response` (`requests.Response`) – The response for querying the top games

**Returns** the new game instances

**Return type** list of `Game`

**Raises** None

### **classmethod** `wrap_json(json, viewers=None, channels=None)`

Create a Game instance for the given json

**Parameters**

- **json** (`dict`) – the dict with the information of the game
- **viewers** (`int`) – The viewer count
- **channels** (`int`) – The viewer count

**Returns** the new game instance

**Return type** `Game`

**Raises** None

#### **name = None**

The name of the game

#### **box = None**

Links for the box logos

#### **logo = None**

Links for the logos

```
twitchid = None  
    Id used by twitch  
viewers = None  
    Current amount of viewers  
channels = None  
    Current amount of channels
```

## pytwitcherapi.models.Stream

```
class pytwitcherapi.models.Stream(game, channel, twitchid, viewers, preview)  
Bases: object
```

A stream on twitch.tv

```
__init__(game, channel, twitchid, viewers, preview)  
Initialize a new stream
```

### Parameters

- **game** (`str`) – name of the game
- **channel** (`Channel`) – the channel that is streaming
- **twitchid** (`int`) – the internal twitch id
- **viewers** (`int`) – the viewer count
- **preview** (`dict`) – a dict with preview picture links of the stream

**Raises** None

## Methods

<code>__init__(game, channel, twitchid, viewers, ...)</code>	Initialize a new stream
<code>wrap_get_stream(response)</code>	Wrap the response from getting a stream into an instance
<code>wrap_json(json)</code>	Create a Stream instance for the given json
<code>wrap_search(response)</code>	Wrap the response from a stream search into instances

```
classmethod wrap_search(response)
```

Wrap the response from a stream search into instances and return them

**Parameters** `response` (`requests.Response`) – The response from searching a stream

**Returns** the new stream instances

**Return type** list of stream

**Raises** None

```
classmethod wrap_get_stream(response)
```

Wrap the response from getting a stream into an instance and return it

**Parameters** `response` (`requests.Response`) – The response from getting a stream

**Returns** the new stream instance

**Return type** list of stream

**Raises** None

**classmethod** `wrap_json(json)`

Create a Stream instance for the given json

**Parameters** `json (dict | None)` – the dict with the information of the stream

**Returns** the new stream instance

**Return type** `Stream | None`

**Raises** None

**game = None**

Name of the game that is being streamed

**channel = None**

The channel instance

**twitchid = None**

The internal twitch id

**viewers = None**

the viewer count

**preview = None**

A dict with preview picture links of the stream

## pytwitcherapi.models.User

### class pytwitcherapi.models.User(`usertype, name, logo, twitchid, displayname, bio`)

Bases: `object`

A user on twitch.tv

#### `__init__(usertype, name, logo, twitchid, displayname, bio)`

Initialize a new user

**Parameters**

- **usertype** (`str`) – the user type on twitch, e.g. "user"
- **name** (`str`) – the username
- **logo** (`str`) – the link to the logo
- **twitchid** (`int`) – the internal twitch id
- **displayname** (`str`) – the name displayed by the interface
- **bio** (`str`) – the user bio

**Raises** None

## Methods

<code>__init__(usertype, name, logo, twitchid, ...)</code>	Initialize a new user
<code>wrap_get_user(response)</code>	Wrap the response from getting a user into an instance
<code>wrap_json(json)</code>	Create a User instance for the given json

**classmethod `wrap_get_user(response)`**

Wrap the response from getting a user into an instance and return it

**Parameters** `response` (`requests.Response`) – The response from getting a user

**Returns** the new user instance

**Return type** list of `User`

**Raises** None

**classmethod `wrap_json(json)`**

Create a User instance for the given json

**Parameters** `json` (`dict` | `None`) – the dict with the information of the user

**Returns** the new user instance

**Return type** `User`

**Raises** None

**`usertype = None`**

the user type on twitch, e.g. "user"

**`name = None`**

the username

**`logo = None`**

link to the logo

**`twitchid = None`**

internal twitch id

**`displayname = None`**

name displayed by the interface

**`bio = None`**

the user bio

## **pytwitcherapi.oauth**

Twitch.tv uses OAuth2 for authorization. We use the Implicit Grant Workflow. The user has to visit an authorization site, login, authorize PyTwitcher. Once he allows PyTwitcher, twitch will redirect him to `pytwitcherapi.REDIRECT_URI`. In the url fragment, there is the access token.

This module features a server, that will respond to the redirection of the user. So if twitch is redirecting to `pytwitcherapi.REDIRECT_URI`, the server is gonna send a website, which will extract the access token, send it as a post request and give the user a response, that everything worked.

## **Classes**

<code>LoginServer(session)</code>	This server responds to the redirection of the user after he granted authorization.
<code>RedirectHandler(request, client_address, server)</code>	This request handler will handle the redirection of the user when he grants authorization to PyTwitcher and twitch redirects him.

Continued on next page

Table 2.34 – continued from previous page

---

<code>TwitchOAuthClient(client_id[, ...])</code>	This is a client needed for <code>oauthlib.oauth2.OAuth2Session</code> .
--	--

---

## pytwitcherapi.oauth.LoginServer

`class pytwitcherapi.oauth.LoginServer(session)`

Bases: `BaseHTTPServer.HTTPServer`

This server responds to the redirection of the user after he granted authorization.

`__init__(session)`

Initialize a new server.

The server will be on `constants.LOGIN_SERVER_ADDRESS`.

**Parameters** `session` (`requests_oauthlib OAuth2Session`) – the session that needs a token

**Raises** None

### Methods

---

<code>__init__(session)</code>	Initialize a new server.
<code>close_request(request)</code>	Called to clean up an individual request.
<code>fileno()</code>	Return socket file number.
<code>finish_request(request, client_address)</code>	Finish one request by instantiating RequestHandler-Class.
<code>get_request()</code>	Get the request and client address from the socket.
<code>handle_error(request, client_address)</code>	Handle an error gracefully.
<code>handle_request()</code>	Handle one request, possibly blocking.
<code>handle_timeout()</code>	Called if no new request arrives within <code>self.timeout</code> .
<code>process_request(request, client_address)</code>	Call <code>finish_request</code> .
<code>serve_forever([poll_interval])</code>	Handle one request at a time until shutdown.
<code>server_activate()</code>	Called by constructor to activate the server.
<code>server_bind()</code>	Override <code>server_bind</code> to store the server name.
<code>server_close()</code>	Called to clean-up the server.
<code>set_token(redirecturl)</code>	Set the token on the session
<code>shutdown()</code>	Stops the <code>serve_forever</code> loop.
<code>shutdown_request(request)</code>	Called to shutdown and close an individual request.
<code>verify_request(request, client_address)</code>	Verify the request.

---

### Attributes

---

<code>address_family</code>
<code>allow_reuse_address</code>
<code>request_queue_size</code>
<code>socket_type</code>
<code>timeout</code>

---

```
session = None
The session that needs a token

set_token(redirecturl)
Set the token on the session

Parameters redirecturl (str) – the original full redirect url

Returns None

Return type None

Raises None
```

## pytwitcherapi.oauth.RedirectHandler

```
class pytwitcherapi.oauth.RedirectHandler(request, client_address, server)
Bases: BaseHTTPServer.BaseHTTPRequestHandler
```

This request handler will handle the redirection of the user when he grants authorization to PyTwitcher and twitch redirects him.

```
__init__(request, client_address, server)
```

### Methods

---

<code>__init__(request, client_address, server)</code>	
<code>address_string()</code>	Return the client address formatted for logging.
<code>date_time_string([timestamp])</code>	Return the current date and time formatted for a message header.
<code>do_GET()</code>	Handle GET requests
<code>do_POST()</code>	Handle POST requests
<code>end_headers()</code>	Send the blank line ending the MIME headers.
<code>finish()</code>	
<code>handle()</code>	Handle multiple requests if necessary.
<code>handle_one_request()</code>	Handle a single HTTP request.
<code>log_date_time_string()</code>	Return the current time formatted for logging.
<code>log_error(format, *args)</code>	Log an error.
<code>log_message(format, *args)</code>	Log an arbitrary message.
<code>log_request([code, size])</code>	Log an accepted request.
<code>parse_request()</code>	Parse a request (internal).
<code>send_error(code[, message])</code>	Send and log an error reply.
<code>send_header(keyword, value)</code>	Send a MIME header.
<code>send_response(code[, message])</code>	Send the response header and log the response code.
<code>setup()</code>	
<code>version_string()</code>	Return the server software version string.

---

### Attributes

---

```
default_request_version
disable_nagle_algorithm
error_content_type
```

Continued on next page

Table 2.38 – continued from previous page

---

error_message_format
extract_site_url
monthname
protocol_version
rbufsize
responses
server_version
success_site_url
sys_version
timeout
wbufsize
weekdayname

---

**extract\_site\_url** = ‘/’  
**success\_site\_url** = ‘/success’

**do\_GET()**  
Handle GET requests

If the path is ‘/’, a site which extracts the token will be generated. This will redirect the user to the ‘/sucess’ page, which shows a success message.

**Returns** None

**Return type** None

**Raises** None

**do\_POST()**  
Handle POST requests

When the user is redirected, this handler will respond with a website which will send a post request with the url fragment as parameters. This will get the parameters and store the original redirection url and fragments in LoginServer.tokenurl.

**Returns** None

**Return type** None

**Raises** None

## pytwitcherapi.oauth.TwitchOAuthClient

```
class pytwitcherapi.oauth.TwitchOAuthClient (client_id, default_token_placement=u'auth_header',
                                            token_type=u'Bearer',      access_token=None,
                                            refresh_token=None,        mac_key=None,
                                            mac_algorithm=None,       token=None,
                                            scope=None,               state=None,   redirect_url=None,
                                            state_generator=<function generate_token>,
                                            **kwargs)
```

Bases: oauthlib.oauth2.rfc6749.clients.mobile\_application.  
MobileApplicationClient

This is a client needed for oauthlib.oauth2.OAuth2Session. It fixes the Authorization header for twitch.

Usually the Authorization Header looks like this:

```
{'Authorization': 'Bearer <>token>'}
```

But Twitch needs it to be like this:

```
{'Authorization': 'OAuth <>token>'}
```

So we override `TwitchOAuthClient._add_bearer_token()` to fix the header.

```
__init__(client_id, default_token_placement=u'auth_header', token_type=u'Bearer', access_token=None, refresh_token=None, mac_key=None, mac_algorithm=None, token=None, scope=None, state=None, redirect_url=None, state_generator=<function generate_token>, **kwargs)
```

Initialize a client with commonly used attributes.

**Parameters** `client_id` – Client identifier given by the OAuth provider upon registration.

**Parameters** `default_token_placement` – Tokens can be supplied in the Authorization header (default), the URL query component (`query`) or the request body (`body`).

**Parameters** `token_type` – OAuth 2 token type. Defaults to Bearer. Change this if you specify the `access_token` parameter and know it is of a different token type, such as a MAC, JWT or SAML token. Can also be supplied as `token_type` inside the `token` dict parameter.

**Parameters** `access_token` – An access token (string) used to authenticate requests to protected resources. Can also be supplied inside the `token` dict parameter.

**Parameters** `refresh_token` – A refresh token (string) used to refresh expired tokens. Can also be supplied inside the `token` dict parameter.

#### Parameters

- `mac_key` – Encryption key used with MAC tokens.
- `mac_algorithm` – Hashing algorithm for MAC tokens.
- `token` – A dict of token attributes such as `access_token`, `token_type` and `expires_at`.

#### Parameters

**Parameters** `scope` – A list of default scopes to request authorization for.  
`state` – A CSRF protection string used during authorization.  
`redirect_url` – The redirection endpoint on the client side to which the user returns after authorization.

**Parameters** `state_generator` – A no argument state generation callable. Defaults to `oauthlib.common.generate_token()`.

## Methods

---

```
__init__(client_id[, ...])
```

Initialize a client with commonly used attributes.

Continued on next page

Table 2.39 – continued from previous page

<code>add_token(uri[, http_method, body, headers, ...])</code>	Add token to the request uri, body or authorization header.
<code>parse_request_body_response(body[, scope])</code>	Parse the JSON response body.
<code>parse_request_uri_response(uri[, state, scope])</code>	Parse the response URI fragment.
<code>prepare_authorization_request(authorization)</code>	Prepare the authorization request.
<code>prepare_refresh_body([body, refresh_token, ...])</code>	Prepare an access token request, using a refresh token.
<code>prepare_refresh_token_request(token_url[, ...])</code>	Prepare an access token refresh request.
<code>prepare_request_body(*args, **kwargs)</code>	Abstract method used to create request bodies.
<code>prepare_request_uri(uri[, redirect_uri, ...])</code>	Prepare the implicit grant request URI.
<code>prepare_token_request(token_url[, ...])</code>	Prepare a token creation request.
<code>prepare_token_revocation_request(...[, ...])</code>	Prepare a token revocation request.

## Attributes

<code>token_types</code>	Supported token types and their respective methods
--------------------------	--

## Data

<code>log</code>	Instances of the Logger class represent a single logging channel.
------------------	---

### `pytwitcherapi.oauth.log = <logging.Logger object>`

Instances of the Logger class represent a single logging channel. A “logging channel” indicates an area of an application. Exactly how an “area” is defined is up to the application developer. Since an application can have any number of areas, logging channels are identified by a unique string. Application areas can be nested (e.g. an area of “input processing” might include sub-areas “read CSV files”, “read XLS files” and “read Gnumeric files”). To cater for this natural nesting, channel names are organized into a namespace hierarchy where levels are separated by periods, much like the Java or Python package namespace. So in the instance given above, channel names might be “input” for the upper level, and “input.csv”, “input.xls” and “input.gnu” for the sub-levels. There is no arbitrary limit to the depth of nesting.

### `pytwitcherapi.session`

API for communicating with twitch

## Classes

<code>OAuthSession()</code>	Session with oauth2 support.
<code>TwitchSession()</code>	Session for making requests to the twitch api

## **pytwitcherapi.session OAuthSession**

```
class pytwitcherapi.session.OAuthSession
    Bases: requests_oauthlib.oauth2_session.OAuth2Session
```

Session with oauth2 support.

You can still use http requests.

```
__init__()
```

Initialize a new oauth session

**Raises** None

### **Methods**

<code>__init__()</code>	Initialize a new oauth session
<code>authorization_url(url[, state])</code>	Form an authorization URL.
<code>close()</code>	Closes all adapters and as such the session
<code>delete(url, **kwargs)</code>	Sends a DELETE request.
<code>fetch_token(token_url[, code, ...])</code>	Generic method for fetching an access token from the token endpoint.
<code>get(url, **kwargs)</code>	Sends a GET request.
<code>get_adapter(url)</code>	Returns the appropriate connection adapter for the given URL.
<code>get_auth_url()</code>	Return the url for the user to authorize PyTwitcher
<code>get_redirect_target(resp)</code>	Receives a Response.
<code>head(url, **kwargs)</code>	Sends a HEAD request.
<code>merge_environment_settings(url, proxies, ...)</code>	Check the environment and merge it with some settings.
<code>mount(prefix, adapter)</code>	Registers a connection adapter to a prefix.
<code>new_state()</code>	Generates a state string to be used in authorizations.
<code>options(url, **kwargs)</code>	Sends a OPTIONS request.
<code>patch(url[, data])</code>	Sends a PATCH request.
<code>post(url[, data, json])</code>	Sends a POST request.
<code>prepare_request(request)</code>	Constructs a <code>PreparedRequest</code> for transmission and returns it.
<code>put(url[, data])</code>	Sends a PUT request.
<code>rebuild_auth(prepared_request, response)</code>	When being redirected we may want to strip authentication from the request to avoid leaking credentials.
<code>rebuild_method(prepared_request, response)</code>	When being redirected we may want to change the method of the request based on certain specs or browser behavior.
<code>rebuild_proxies(prepared_request, proxies)</code>	This method re-evaluates the proxy configuration by considering the environment variables.
<code>refresh_token(token_url[, refresh_token, ...])</code>	Fetch a new access token using a refresh token.
<code>register_compliance_hook(hook_type, hook)</code>	Register a hook for request/response tweaking.
<code>request(method, url, **kwargs)</code>	Constructs a <code>requests.Request</code> , prepares it and sends it.
<code>resolve_redirects(resp, req[, stream, ...])</code>	Receives a Response.
<code>send(request, **kwargs)</code>	Send a given <code>PreparedRequest</code> .
<code>shutdown_login_server()</code>	Shutdown the login server and thread

Continued on next page

Table 2.43 – continued from previous page

<code>start_login_server()</code>	Start a server that will get a request from a user logging in.
<code>token_from_fragment(authorization_response)</code>	Parse token from the URI fragment, used by MobileApplicationClients.

## Attributes

<code>access_token</code>	
<code>authorized</code>	Boolean that indicates whether this session has an OAuth token or not.
<code>client_id</code>	
<code>token</code>	

**`login_server = None`**

The server that handles the login redirect

**`login_thread = None`**

The thread that serves the login server

**`request(method, url, **kwargs)`**

Constructs a `requests.Request`, prepares it and sends it. Raises `HTTPErrors` by default.

**Parameters**

- `method (str)` – method for the new Request object.
- `url (str)` – URL for the new Request object.
- `kwargs` – keyword arguments of `requests.Session.request()`

**Returns** a response object

**Return type** `requests.Response`

**Raises** `requests.HTTPError`

**`start_login_server()`**

Start a server that will get a request from a user logging in.

This uses the Implicit Grant Flow of OAuth2. The user is asked to login to twitch and grant PyTwitcher authorization. Once the user agrees, he is redirected to an url. This server will respond to that url and get the oauth token.

The server serves in another thread. To shut him down, call `TwitchSession.shutdown_login_server()`.

This sets the `TwitchSession.login_server`, `TwitchSession.login_thread` variables.

**Returns** The created server

**Return type** `BaseHTTPServer.HTTPServer`

**Raises** None

**`shutdown_login_server()`**

Shutdown the login server and thread

**Returns** None

**Return type** `None`

**Raises** None

**get\_auth\_url()**

Return the url for the user to authorize PyTwitcher

**Returns** The url the user should visit to authorize PyTwitcher

**Return type** `str`

**Raises** None

## pytwitcherapi.session.TwitchSession

### class pytwitcherapi.session.TwitchSession

Bases: `pytwitcherapi.session OAuthSession`

Session for making requests to the twitch api

Use `TwitchSession.kraken_request()`, `TwitchSession.usher_request()`, `TwitchSession.oldapi_request()` to make easier calls to the api directly.

To get authorization, the user has to grant PyTwitcher access. The workflow goes like this:

1. Start the login server with `TwitchSession.start_login_server()`.
2. User should visit `TwitchSession.get_auth_url()` in his browser and follow instructions (e.g Login and Allow PyTwitcher).
3. Check if the session is authorized with `TwitchSession.authorized()`.
4. Shut the login server down with `TwitchSession.shutdown_login_server()`.

Now you can use methods that need authorization.

### \_\_init\_\_()

Initialize a new TwitchSession

**Raises** None

## Methods

<code>__init__()</code>	Initialize a new TwitchSession
<code>authorization_url(url[, state])</code>	Form an authorization URL.
<code>close()</code>	Closes all adapters and as such the session
<code>delete(url, **kwargs)</code>	Sends a DELETE request.
<code>fetch_token(token_url[, code, ...])</code>	Generic method for fetching an access token from the token endpoint.
<code>fetch_viewers(game)</code>	Query the viewers and channels of the given game and
<code>followed_streams(*args, **kwargs)</code>	Return the streams the current user follows.
<code>get(url, **kwargs)</code>	Sends a GET request.
<code>get_adapter(url)</code>	Returns the appropriate connection adapter for the given URL.
<code>get_auth_url()</code>	Return the url for the user to authorize PyTwitcher
<code>get_channel(name)</code>	Return the channel for the given name
<code>get_channel_access_token(channel)</code>	Return the token and sig for the given channel
<code>get_chat_server(channel)</code>	Get an appropriate chat server for the given channel
<code>get_emote_picture(emote[, size])</code>	Return the picture for the given emote

Continued on next page

Table 2.45 – continued from previous page

<code>get_game(name)</code>	Get the game instance for a game name
<code>get_playlist(channel)</code>	Return the playlist for the given channel
<code>get_quality_options(channel)</code>	Get the available quality options for streams of the given channel
<code>get_redirect_target(resp)</code>	Receives a Response.
<code>get_stream(channel)</code>	Return the stream of the given channel
<code>get_streams([game, channels, limit, offset])</code>	Return a list of streams queried by a number of parameters
<code>get_user(name)</code>	Get the user for the given name
<code>head(url, **kwargs)</code>	Sends a HEAD request.
<code>kraken_request(method, endpoint, **kwargs)</code>	Make a request to one of the kraken api endpoints.
<code>merge_environment_settings(url, proxies, ...)</code>	Check the environment and merge it with some settings.
<code>mount(prefix, adapter)</code>	Registers a connection adapter to a prefix.
<code>new_state()</code>	Generates a state string to be used in authorizations.
<code>oldapi_request(method, endpoint, **kwargs)</code>	Make a request to one of the old api endpoints.
<code>options(url, **kwargs)</code>	Sends a OPTIONS request.
<code>patch(url[, data])</code>	Sends a PATCH request.
<code>post(url[, data, json])</code>	Sends a POST request.
<code>prepare_request(request)</code>	Constructs a <code>PreparedRequest</code> for transmission and returns it.
<code>put(url[, data])</code>	Sends a PUT request.
<code>query_login_user(*args, **kwargs)</code>	Query and return the currently logined user
<code>rebuild_auth(prepared_request, response)</code>	When being redirected we may want to strip authentication from the request to avoid leaking credentials.
<code>rebuild_method(prepared_request, response)</code>	When being redirected we may want to change the method of the request based on certain specs or browser behavior.
<code>rebuild_proxies(prepared_request, proxies)</code>	This method re-evaluates the proxy configuration by considering the environment variables.
<code>refresh_token(token_url[, refresh_token, ...])</code>	Fetch a new access token using a refresh token.
<code>register_compliance_hook(hook_type, hook)</code>	Register a hook for request/response tweaking.
<code>request(method, url, **kwargs)</code>	Constructs a <code>requests.Request</code> , prepares it and sends it.
<code>resolve_redirects(resp, req[, stream, ...])</code>	Receives a Response.
<code>search_channels(query[, limit, offset])</code>	Search for channels and return them
<code>search_games(query[, live])</code>	Search for games that are similar to the query
<code>search_streams(query[, hls, limit, offset])</code>	Search for streams and return them
<code>send(request, **kwargs)</code>	Send a given PreparedRequest.
<code>shutdown_login_server()</code>	Shutdown the login server and thread
<code>start_login_server()</code>	Start a server that will get a request from a user logging in.
<code>token_from_fragment(authorization_response)</code>	Parse token from the URI fragment, used by MobileApplicationClients.
<code>top_games([limit, offset])</code>	Return the current top games
<code>usher_request(method, endpoint, **kwargs)</code>	Make a request to one of the usher api endpoints.

## Attributes

---

`access_token`

Continued on next page
------------------------

Table 2.46 – continued from previous page

authorized	Boolean that indicates whether this session has an OAuth token or not.
client_id	
token	Return the oauth token

**baseurl = None**

The baseurl that gets prepended to every request url

**current\_user = None**

The currently loggedin user.

**token**

Return the oauth token

**Returns** the token

**Return type** `dict`

**Raises** None

**kraken\_request (method, endpoint, \*\*kwargs)**

Make a request to one of the kraken api endpoints.

Headers are automatically set to accept `TWITCH_HEADER_ACCEPT`. Also the client id from `CLIENT_ID` will be set. The url will be constructed of `TWITCH_KRAKENURL` and the given endpoint.

**Parameters**

- **method** (`str`) – the request method
- **endpoint** (`str`) – the endpoint of the kraken api. The base url is automatically provided.
- **kwargs** – keyword arguments of `requests.Session.request()`

**Returns** a resone object

**Return type** `requests.Response`

**Raises** `requests.HTTPError`

**usher\_request (method, endpoint, \*\*kwargs)**

Make a request to one of the usher api endpoints.

The url will be constructed of `TWITCH_USHERURL` and the given endpoint.

**Parameters**

- **method** (`str`) – the request method
- **endpoint** (`str`) – the endpoint of the usher api. The base url is automatically provided.
- **kwargs** – keyword arguments of `requests.Session.request()`

**Returns** a resone object

**Return type** `requests.Response`

**Raises** `requests.HTTPError`

**oldapi\_request (method, endpoint, \*\*kwargs)**

Make a request to one of the old api endpoints.

The url will be constructed of `TWITCH_APICURL` and the given endpoint.

**Parameters**

- **method** (`str`) – the request method
- **endpoint** (`str`) – the endpoint of the old api. The base url is automatically provided.
- **kwargs** – keyword arguments of `requests.Session.request()`

**Returns** a response object

**Return type** `requests.Response`

**Raises** `requests.HTTPError`

#### **fetch\_viewers** (`game`)

Query the viewers and channels of the given game and set them on the object

**Returns** the given game

**Return type** `models.Game`

**Raises** None

#### **search\_games** (`query, live=True`)

Search for games that are similar to the query

**Parameters**

- **query** (`str`) – the query string
- **live** (`bool`) – If true, only returns games that are live on at least one channel

**Returns** A list of games

**Return type** list of `models.Game` instances

**Raises** None

#### **top\_games** (`limit=10, offset=0`)

Return the current top games

**Parameters**

- **limit** (`int`) – the maximum amount of top games to query
- **offset** (`int`) – the offset in the top games

**Returns** a list of top games

**Return type** list of `models.Game`

**Raises** None

#### **get\_game** (`name`)

Get the game instance for a game name

**Parameters** `name` (`str`) – the name of the game

**Returns** the game instance

**Return type** `models.Game` | None

**Raises** None

#### **get\_channel** (`name`)

Return the channel for the given name

**Parameters** `name` (`str`) – the channel name

**Returns** the model instance

**Return type** `models.Channel`

**Raises** None

**search\_channels** (*query*, *limit*=25, *offset*=0)

Search for channels and return them

**Parameters**

- **query** (`str`) – the query string
- **limit** (`int`) – maximum number of results
- **offset** (`int`) – offset for pagination

**Returns** A list of channels

**Return type** list of `models.Channel` instances

**Raises** None

**get\_stream** (*channel*)

Return the stream of the given channel

**Parameters** **channel** (`str` | `models.Channel`) – the channel that is broadcasting. Either name or `models.Channel` instance

**Returns** the stream or None, if the channel is offline

**Return type** `models.Stream` | None

**Raises** None

**get\_streams** (*game*=None, *channels*=None, *limit*=25, *offset*=0)

Return a list of streams queried by a number of parameters sorted by number of viewers descending

**Parameters**

- **game** (`str` | `models.Game`) – the game or name of the game
- **channels** (list of `models.Channel` or `str`) – list of `models.Channels` or channel names (can be mixed)
- **limit** (`int`) – maximum number of results
- **offset** (`int`) – offset for pagination

**Returns** A list of streams

**Return type** list of `models.Stream`

**Raises** None

**search\_streams** (*query*, *hls*=False, *limit*=25, *offset*=0)

Search for streams and return them

**Parameters**

- **query** (`str`) – the query string
- **hls** (`bool`) – If true, only return streams that have hls stream
- **limit** (`int`) – maximum number of results
- **offset** (`int`) – offset for pagination

**Returns** A list of streams

**Return type** list of `models.Stream` instances

**Raises** None

**followed\_streams**(\*args, \*\*kwargs)

Return the streams the current user follows.

Needs authorization `user_read`.

**Parameters**

- `limit` (`int`) – maximum number of results
- `offset` (`int`) – offset for pagination

**Returns** A list of streams

**Return type** `list`of :class:`~models.Stream` instances`

**Raises** `exceptions.NotAuthorizedError`

**get\_user**(*name*)

Get the user for the given name

**Parameters** `name` (`str`) – The username

**Returns** the user instance

**Return type** `models.User`

**Raises** None

**query\_login\_user**(\*args, \*\*kwargs)

Query and return the currently logged in user

**Returns** The user instance

**Return type** `models.User`

**Raises** `exceptions.NotAuthorizedError`

**get\_playlist**(*channel*)

Return the playlist for the given channel

**Parameters** `channel` (`models.Channel` | `str`) – the channel

**Returns** the playlist

**Return type** `m3u8.M3U8`

**Raises** `requests.HTTPError` if channel is offline.

**get\_quality\_options**(*channel*)

Get the available quality options for streams of the given channel

Possible values in the list:

- source
- high
- medium
- low
- mobile
- audio

**Parameters** `channel` (`models.Channel` | `str`) – the channel or channel name

**Returns** list of quality options

**Return type** list of str

**Raises** requests.HTTPError if channel is offline.

**get\_channel\_access\_token**(channel)

Return the token and sig for the given channel

**Parameters** channel (channel | str) – the channel or channel name to get the access token for

**Returns** The token and sig for the given channel

**Return type** (unicode, unicode)

**Raises** None

**get\_chat\_server**(channel)

Get an appropriate chat server for the given channel

Usually the server is irc.twitch.tv. But because of the delicate twitch chat, they use a lot of servers. Big events are on special event servers. This method tries to find a good one.

**Parameters** channel (models.Channel) – the channel with the chat

**Returns** the server address and port

**Return type** (str, int)

**Raises** None

**get\_emote\_picture**(emote, size=1.0)

Return the picture for the given emote

**Parameters**

- emote ([pytwitcherapi.chat.message.Emote](#)) – the emote object
- size (float) – the size of the picture. Choices are: 1.0, 2.0, 3.0

**Returns** A string resembling the picturedata of the emote

**Return type** str

**Raises** None

## Functions

---

**needs\_auth**(meth)

Wraps a method of [TwitchSession](#) and raises an exceptions.NotAuthorizedError if before calling the method, the session isn't authorized.

---

## Data

---

[AUTHORIZATION\\_BASE\\_URL](#)

Authorisation Endpoint

[CLIENT\\_ID](#)

The client id of pytwitcher on twitch.

[SCOPES](#)

The scopes that PyTwitcher needs

[TWITCH\\_APIURL](#)

The baseurl for the old twitch api

[TWITCH\\_HEADER\\_ACCEPT](#)

The header for the Accept key to tell twitch which api version it should use

Continued on next page

Table 2.48 – continued from previous page

<code>TWITCH_KRAKENURL</code>	The baseurl for the twitch api
<code>TWITCH_STATUSURL</code>	<code>str(object='')</code> -> string
<code>TWITCH_USHERURL</code>	The baseurl for the twitch usher api
<code>absolute_import</code>	
<code>log</code>	Instances of the Logger class represent a single logging channel.

`pytwitcherapi.session.needs_auth(meth)`

Wraps a method of `TwitchSession` and raises an `exceptions.NotAuthorizedError` if before calling the method, the session isn't authorized.

**Parameters** `meth` –

**Returns** the wrapped method

**Return type** Method

**Raises** None

`pytwitcherapi.session.AUTHORIZATION_BASE_URL = 'https://api.twitch.tv/kraken/oauth2/authorize'`

Authorisation Endpoint

`pytwitcherapi.session.CLIENT_ID = '642a2vtmqfumca8hmfcpkosxlkmqifb'`

The client id of pytwitcher on twitch. Use environment variable PYTWITCHER\_CLIENT\_ID or pytwitcher default value.

`pytwitcherapi.session.SCOPES = ['user_read', 'chat_login']`

The scopes that PyTwitcher needs

`pytwitcherapi.session.TWITCH_APIURL = 'http://api.twitch.tv/api/'`

The baseurl for the old twitch api

`pytwitcherapi.session.TWITCH_HEADER_ACCEPT = 'application/vnd.twitchtv.v3+json'`

The header for the Accept key to tell twitch which api version it should use

`pytwitcherapi.session.TWITCH_KRAKENURL = 'https://api.twitch.tv/kraken/'`

The baseurl for the twitch api

`pytwitcherapi.session.TWITCH_STATUSURL = 'http://twitchstatus.com/api/status?type=chat'`

`str(object='')` -> string

Return a nice string representation of the object. If the argument is a string, the return value is the same object.

`pytwitcherapi.session.TWITCH_USHERURL = 'http://usher.twitch.tv/api/'`

The baseurl for the twitch usher api

`pytwitcherapi.session.absolute_import = _Feature(2, 5, 0, 'alpha', 1), (3, 0, 0, 'alpha', 0), 16384)`

`pytwitcherapi.session.log = <logging.Logger object>`

Instances of the Logger class represent a single logging channel. A “logging channel” indicates an area of an application. Exactly how an “area” is defined is up to the application developer. Since an application can have any number of areas, logging channels are identified by a unique string. Application areas can be nested (e.g. an area of “input processing” might include sub-areas “read CSV files”, “read XLS files” and “read Gnumeric files”). To cater for this natural nesting, channel names are organized into a namespace hierarchy where levels are separated by periods, much like the Java or Python package namespace. So in the instance given above, channel names might be “input” for the upper level, and “input.csv”, “input.xls” and “input.gnu” for the sub-levels. There is no arbitrary limit to the depth of nesting.

## Module contents

### Data

---

`absolute_import`

---

```
pytwitcherapi.absolute_import = _Feature((2, 5, 0, 'alpha', 1), (3, 0, 0, 'alpha', 0), 16384)
```

## Contributing

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

### Types of Contributions

#### Report Bugs

Report bugs at <https://github.com/Pytwitcher/pytwitcherapi/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

#### Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” is open to whoever wants to implement it.

#### Implement Features

Look through the GitHub issues for features. Anything tagged with “feature” is open to whoever wants to implement it.

#### Write Documentation

pytwitcherapi could always use more documentation, whether as part of the official pytwitcherapi docs, in docstrings, or even on the web in blog posts, articles, and such.

#### Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/Pytwitcher/pytwitcherapi/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.

- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## Get Started!

Ready to contribute? Here's how to set up *pytwitcherapi* for local development.

1. Fork the *pytwitcherapi* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/pytwitcherapi.git
```

3. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

4. When you're done making changes, check that your changes pass style and unit tests, including testing other Python versions with tox:

```
$ tox
```

To get tox, just pip install it.

5. Commit your changes and push your branch to GitHub:

```
$ git add .  
$ git commit -m "Your detailed description of your changes."  
$ git push origin name-of-your-bugfix-or-feature
```

6. Submit a pull request through the GitHub website.

## Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 2.6, 2.7, and 3.3, and for PyPy. Check <https://travis-ci.org/Pytwitcher/pytwitcherapi> under pull requests for active pull requests or run the `tox` command and make sure that the tests pass for all supported Python versions.

## Tips

To run a subset of tests:

```
$ py.test test/test_pytwitcherapi.py
```

## Credits

### Development Lead

- David Zuber <[zuber.david@gmx.de](mailto:zuber.david@gmx.de)>

### Contributors

- Benjamin Coriou
- Tim Woocker

## History

### 0.1.1 (2015-03-15)

- First release on PyPI.
- Pulled pytwitcherapi out of main project pytwitcher

### 0.1.2 (2015-03-15)

- Fix wrapping search stream results due to incomplete channel json

### 0.1.3 (2015-03-23)

- Refactor twitch module into models and session module

### 0.1.4 (2015-03-23)

- Fix wrap json using actual class instead of cls

### 0.2.0 (2015-04-12)

- Authentication: User can login and TwitchSession can retrieve followed streams.

### 0.3.0 (2015-05-08)

- Easier imports. Only import the package for most of the cases.
- Added logging. Configure your logger and pytwitcher will show debug messages.

### 0.3.1 (2015-05-09)

- Fix login server shutdown by correctly closing the socket

## **0.4.0 (2015-05-12)**

- IRC client for twitch chat

## **0.5.0 (2015-05-13)**

- IRC v3 Tags for messages

## **0.5.1 (2015-05-13)**

- Fix coverage reports via travis

## **0.6.0 (2015-05-16)**

- Add limit for sending messages

## **0.7.0 (2015-05-16)**

- IRCClient manages two connections. Receives own messages from the server (with tags).
- Improved test thread saftey

## **0.7.1 (2015-05-22)**

- IRCClient shutdown is now thread-safe through events

## **0.7.2 (2015-05-30)**

- Add TwitchSession.get\_emote\_picture(emote, size).
- Capabilities for chat: twitch.tv/membership, twitch.tv/commands, twitch.tv/tags

## **0.8.0 (2015-05-31)**

- Replace context managers for apis with dedicated methods. The context managers made it difficult to use a session thread-safe because they relied (more heavily) on the state of the session.

## **0.9.0 (2016-09-16)**

- Remove `on_schedule` argument for irc client. `irc >=15.0` required.
- [#17](#): Always submit a client id in the headers. Credits to [Coriou](#).
- Client ID can be provided via environment variable `PYTWITCHER_CLIENT_ID`.

## **0.9.1 (2016-09-18)**

- Make example chat client python 3 compatible
- #16: Ignore unknown arguments from twitchstatus
- Use Client ID for old api requests as well

## **0.9.2 (2017-08-27)**

- Fix compatibility to `irc>=16.0`. Thanks to [crey4fun](#).

## **0.9.3 (2017-08-27)**

- Re-release of 0.9.2

# CHAPTER 3
