# CHAPTER 1

---

## Synopsis

---

qidicom provides a facade for DICOM file interaction.

**API** <http://qidicom.readthedocs.org/en/latest/api/index.html>

**Git** [github.com/ohsu-qin/qidicom](https://github.com/ohsu-qin/qidicom)

## CHAPTER 2

---

### Feature List

---

1. Python logging configuration.
2. Common command utility functions.
3. Collection data structures and utilities.
4. File helper functions.

# CHAPTER 3

---

## Installation

---

Install the `qidicom` package with Python pip:

```
pip install qidicom
```

# CHAPTER 4

---

## Usage

---

Run the following command for the utility options:

```
lsdicom --help
```

# CHAPTER 5

---

## Development

---

See the [qipipe Development Guide](#) for project download, testing and documentation.

---

## API Documentation

### **hierarchy**

```
class qidicom.hierarchy.ImageHierarchy(*files)
```

Bases: `qiutil.dictionary_hierarchy.DictionaryHierarchy`

`ImageHierarchy` wraps the DICOM image subject/study/series/image hierarchy.

:param the input DICOM files

```
__init__(*files)
```

:param the input DICOM files

```
add(ds)
```

Adds the subject-study-series-image hierarchy entries from the given DICOM dataset.

**Parameters** `ds` – the DICOM dataset

```
qidicom.hierarchy.group_by(tag, *files)
```

Groups DICOM files by the given tag description. Subtraction images, indicated by a SUB DICOM Image Type, are ignored. The tag can elide blanks, e.g. ‘SeriesNumber’.

**Parameters**

- `tag` – the DICOM tag
- `dicom_files` – the DICOM files or directories

**Returns** a {tag value: [DICOM file names]} dictionary

```
qidicom.hierarchy.read_hierarchy(*files)
    Returns the ImageHierarchy for the DICOM files in the given locations.

    Parameters files – the files or directories to walk for DICOM files
    Returns the image hierarchy
    Return type qutil.image_hierarchy.ImageHierarchy
```

## meta

```
class qidicom.meta.Editor(**edits)
    Bases: object

    DICOM tag editor.

    Creates a new DICOM tag editor.

    Parameters edits – the edits tag value modifications

    __init__(**edits)
        Creates a new DICOM tag editor.

        Parameters edits – the edits tag value modifications

    edit(dataset)
        Applies this editor's edits tag value modifications.

        Parameters dataset – the pydicom dicom dataset object

qidicom.meta.select(ds, *tags)
    Reads the given DICOM dataset tags.

    Parameters
        • ds – the pydicom dicom object
        • tags – the names of tags to read (default all unbracketed tags)

    Returns the tag name => value dictionary
```

## reader

```
class qidicom.reader.DicomHeaderIterator(*dicom_files)
    Bases: qidicom.reader.DicomIterator

    DicomHeaderIterator is a generator class for reading the pydicom non-pixel data sets from DICOM files.

    __init__(*dicom_files)

class qidicom.reader.DicomIterator(*dicom_files, **opts)
    Bases: qutil.file.FileIterator

    DicomIterator is a generator class for reading the pydicom data sets from DICOM files.

    Parameters dicom_files – the DICOM files to include

    __init__(*dicom_files, **opts)

    Parameters dicom_files – the DICOM files to include

qidicom.reader.iter_dicom(*dicom_files)
    Iterates over the DICOM data sets for DICOM files at the given locations.
```

**Parameters** `dicom_files` – the DICOM files or directories containing DICOM files

`qidicom.reader.iter_dicom_headers (*dicom_files)`

Iterates over the DICOM headers for DICOM files at the given locations.

**Parameters** `dicom_files` – the DICOM files or directories containing DICOM files

## writer

`qidicom.writer.edit (*in_files, **opts)`

Edits the given DICOM files. The `dest` option can be either the destination directory path or an output file namer function. If `dest` is a directory path, then the output file location is a file in the given destination directory with the same unqualified file name as the input file. If the `dest` option is a function, then the output file location is the result of calling that function with the input file path as an argument. The default is to edit the file in-place.

### Parameters

- `in_files` – the input DICOM files or directories containing DICOM files
- `opts` – the following options:
- `dest` – the destination directory or file namer function

**Yield** the :meth:`qidicom.reader.next` pydicom dicom object

---

## Python Module Index

---

### q

`qidicom.hierarchy`, 9

`qidicom.meta`, 10

`qidicom.reader`, 10

`qidicom.writer`, 11

### Symbols

`__init__()` (qidicom.hierarchy.ImageHierarchy method), 9  
`__init__()` (qidicom.meta.Editor method), 10  
`__init__()` (qidicom.reader.DicomHeaderIterator method), 10  
`__init__()` (qidicom.reader.DicomIterator method), 10

### A

`add()` (qidicom.hierarchy.ImageHierarchy method), 9

### D

`DicomHeaderIterator` (class in qidicom.reader), 10  
`DicomIterator` (class in qidicom.reader), 10

### E

`edit()` (in module qidicom.writer), 11  
`edit()` (qidicom.meta.Editor method), 10  
`Editor` (class in qidicom.meta), 10

### G

`group_by()` (in module qidicom.hierarchy), 9

### I

`ImageHierarchy` (class in qidicom.hierarchy), 9  
`iter_dicom()` (in module qidicom.reader), 10  
`iter_dicom_headers()` (in module qidicom.reader), 11

### Q

`qidicom.hierarchy` (module), 9  
`qidicom.meta` (module), 10  
`qidicom.reader` (module), 10  
`qidicom.writer` (module), 11

### R

`read_hierarchy()` (in module qidicom.hierarchy), 9

### S

`select()` (in module qidicom.meta), 10
