Version 0.1

Release 0.1.0

This extension adds a single role to the reStructuredText parser of [Sphinx](#).

:version-ref:

`version-ref` takes its argument, replaces all occurrences of `{version}` in it by the string set by the `version` configuration variable and similarly for all occurrences of `{release}`. Then it will process its argument as if it were a normal URI (uniform resource identifier).

Example

```
Some text in which I would like to reference to this specific version's
repository :version-ref:`See version {version} here!
<

Some text in which I would like to reference to this specific version's repository See version 0.1 here!

```

CHAPTER 1

Usage

In your `conf.py` file:

```
release = '0.1.0'
version = '.'.join(release.split('.')[:2])
extensions = ['sphinx_version_ref']
```

Where version can of course be any string. The following uses of `<ref>` then will be parsed as:

Entered as <code><ref></code>	Parsed as	Resulting in
<code>https://docs.com/{version}/index.html</code>	<code>`https://docs.com/0.0/index.html`_</code>	https://docs.com/0.1/index.html
<code>Repo version {version} <http://github.com/user/project/tree/{release}></code>	<code>`Repo version 0.0 <http://github.com/user/project/tree/0.1.0a0>`_</code>	Repo version 0.1
