manage user configuration for python projects

Contents:

user_config package

Submodules

user_config.ini module

ini configuration file format.

`user_config.ini.ini_read`(`_`, `path`, `elements`)

Read ini configuration file and populate *data*.

Parameters

- `_` (`user_config.Config`) – IGNORED
- `path` (`pathlib.Path`) – path to configuration file
- `elements` (`Dict[ConfigElement]`) – configuration element tree

Raises `None`

Returns

Return type `None`

Examples

..doctest:

```
>>> TODO
```

`user_config.ini.ini_validate`(`_`, `elements`)

Make sure element tree is suitable for ini files.

Parameters

- `_(user_config.Config)` – IGNORED
- **elements** (*Dict* [*ConfigElement*]) – element tree

Raises `InvalidConfigTree`: – if the config tree is inappropriate for ini files

Returns

Return type `None`

Examples

..doctest:

```
>>> TODO
```

`user_config.ini.ini_write`(`_`, `elements`, `doc`)

Print default ini file.

This includes data already set in the existing configuration files.

Parameters

- `_(user_config.Config)` – IGNORED
- **elements** (*Dict* [*ConfigElement*]) – configuration element tree
- **doc** (*Option* [*str*]) – *Config* class docstring

Raises `None`

Returns

Return type `None`

Examples

..doctest:

```
>>> TODO
```

`user_config.ini.register_extension`()

Register ini file format functions with *user_config*.

Returns

Return type `Dict`

Examples

..doctest:

```
>>> register_extension()
{'read': <function ini_read at 0x...>, 'write': <function ini_write at 0x...>,
↪ 'validate': <function ini_validate at 0x...>, 'extension': 'cfg'}
```

Module contents

User config management.

```
class user_config.BooleanListOption (doc=None,          default=None,          required=True,
                                     short_name=None,    long_name=None,    validate=None,
                                     additive=False)
```

Bases: `user_config.StringListOption`

List configuration element with boolean content.

subtype
alias of `bool`

```
class user_config.BooleanOption (doc=None, default=None, required=True, short_name=None,
                                long_name=None, validate=None)
```

Bases: `user_config.ConfigElement`

Configuration element with boolean value.

type_
alias of `bool`

```
class user_config.Config (file_name='config', global_path=None, user_path=None, cli=True)
```

Bases: `user_config.MappingMixin`

Base class for application configuration.

Keyword Arguments

- **file_name** (*str*, *optional*) – name of the configuration file, defaults to `config`
- **global_path** (*pathlib.Path*, *optional*) – overwrite system global configuration path, defaults to `None`
- **user_path** (*pathlib.Path*, *optional*) – overwrite system user configuration path, defaults to `None`
- **cli** (*bool*, *optional*) – whether to parse commandline arguments, defaults to `True`

Raises

- `AttributeError`: – if *application* or *author* is not set
- `InvalidConfigTree`: – if configuration tree is inappropriate for *file_type*
- `InvalidData`: – if user supplied invalid data for a configuration element
- `MissingData`: – if an element marked as required has no value

file_type
str – file type to use for configuration files

application
str – application name

author
str – application author

version
str, optional – application version (set if your configuration is version dependent)

Examples

..doctest:

```
>>> TODO
```

application = None

author = None

version = None

class user_config.**ConfigElement** (*doc=None, default=None, required=True, short_name=None, long_name=None, validate=None*)

Bases: `object`

Base class for configuration elements.

Keyword Arguments

- **doc** (*str, optional*) – documentation for this option, defaults to None
- **default** (*Any, optional*) – fallback value, defaults to None
- **required** (*bool, optional*) – MUST a value be present? If no default is provided, this can result in a MissingData exception. Defaults to True
- **short_name** (*str, optional*) – short name for use with command line arguments, defaults to None
- **long_name** (*str, optional*) – overwrite default name for command line arguments, defaults to None
- **validate** (*Callable[Any, None], optional*) – additional validation function, defaults to None

Raises InvalidData: – if default value does not pass validation

creation_counter

int – global count of config elements, used to maintain field order

element_name

str – name of instance, provided by containing class

type_

type – python type of variable that this class represents

action

str – action for argparse

Examples

..doctest:

```
>>> TODO
```

action = 'store'

construct_parser (*parser*)

Add self to parser.

Parameters `parser` (*argparse.ArgumentParser*) – the argument parser to add an option to

Raises None

Returns

Return type None

Examples

..doctest:

```
>>> TODO
```

```
creation_counter = 0
```

```
element_name = None
```

```
extract_data_from_parser (command_line_arguments)
```

Get value from parser.

Parameters `command_line_arguments` (*argparse.Namespace*) – parsed arguments

Raises None

Returns

Return type None

Examples

..doctest:

```
>>> TODO
```

```
get_default ()
```

Return default value.

```
get_value ()
```

Return current option value.

```
has_default ()
```

Return True if element has a default value.

```
set_value (value)
```

Validate and store value.

```
type_
```

alias of `str`

```
validate (value)
```

Validate individual value.

Parameters `value` (*Any*) – to be validated

Raises `InvalidData`: – if validation fails

Returns

Return type None

Examples

..doctest:

```
>>> TODO
```

validate_data()

Validate data.

Raises

- `InvalidData`: – if validation fails
- `MissingData`: – if *self.required* is *True* and our value is *None*

Returns

Return type `None`

Examples

..doctest:

```
>>> TODO
```

class `user_config.ConfigMeta`

Bases: `type`

ORM-like magic for configuration class.

Gather all *ConfigElement* attributes into *_elements* and get correct *_validate*, *_read* and *_writer* functions.

Parameters

- **cls_name** (*str*) – class name
- **cls_parents** (*Tuple[class]*) – class parents
- **cls_attributes** (*Dict*) – class attributes

Raises

- `AttributeError`: – if class tries to overwrite a reserved attribute
- `ImportError`: – if no appropriate *entry_point* could be found for *file_type*

Examples

..doctest:

```
>>> TODO
```

class `user_config.FloatListOption` (*doc=None, default=None, required=True, short_name=None, long_name=None, validate=None, additive=False*)

Bases: `user_config.StringListOption`

List configuration element with float content.

subtype

alias of `float`

```
class user_config.FloatOption (doc=None, default=None, required=True, short_name=None,  
                                long_name=None, validate=None)
```

Bases: `user_config.ConfigElement`

Configuration element with float value.

```
type_  
    alias of float
```

```
class user_config.IntegerListOption (doc=None, default=None, required=True,  
                                     short_name=None, long_name=None, validate=None,  
                                     additive=False)
```

Bases: `user_config.StringListOption`

List configuration element with integer content.

```
subtype  
    alias of int
```

```
class user_config.IntegerOption (doc=None, default=None, required=True, short_name=None,  
                                  long_name=None, validate=None)
```

Bases: `user_config.ConfigElement`

Configuration element with integer value.

```
type_  
    alias of int
```

```
exception user_config.InvalidConfigTree
```

Bases: `Exception`

Inappropriate configuration tree for file type.

```
exception user_config.InvalidData
```

Bases: `Exception`

User supplied invalid data for a configuration element.

```
class user_config.MappingMixin
```

Bases: `object`

Methods for emulating a mapping type.

```
get (key, default)  
    Get items without risking a KeyError.
```

```
items ()  
    Return a view of dictionary key, value pairs.
```

```
keys ()  
    Return a view of dictionary keys.
```

```
update (*args, **kwargs)  
    Update more than one key at a time.
```

```
values ()  
    Return a view of dictionary values.
```

```
exception user_config.MissingData
```

Bases: `Exception`

An element marked as required is missing a value.

```
class user_config.Section (required=True, validate=None)
```

Bases: `user_config.ConfigElement, user_config.MappingMixin`

Named container that contains ConfigElements.

Keyword Arguments

- **required** (*bool*, *optional*) – MUST section be present? If no default is provided for any required content elements, this can result in a MissingData exception. to find out if an optional section is complete, see *self.incomplete_count*. Defaults to True
- **validate** (*Callable[Any, None]*, *optional*) – additional validation function, defaults to None

Raises AttributeError: – if content element is not a *ConfigElement*

creation_counter

int – global count of config elements, used to maintain field order

element_name

str – name of instance, provided by containing class

type_

type – python type of variable that this class represents

action

str – action for argparse

incomplete_count

int – Number of content elements which are required, but do not have a value. Useful for sections which are not marked as required, but do have required elements.

Examples

..doctest:

```
>>> TODO
```

construct_parser (*parser*)

extract_data_from_parser (*command_line_arguments*)

get_elements ()

Return raw element tree, use with caution.

get_value ()

Return current content value.

has_default ()

Return True because Section always has a default value.

incomplete_count = 0

set_value (*value*)

Validate and store value.

type_

alias of *dict*

validate (*value*)

validate_data ()

class `user_config.StringListOption` (*doc=None, default=None, required=True, short_name=None, long_name=None, validate=None, additive=False*)

Bases: `user_config.ConfigElement`

Configuration element with list value.

Keyword Arguments

- **doc** (*str*, *optional*) – documentation for this option, defaults to None
- **default** (*Any*, *optional*) – fallback value, defaults to None
- **required** (*bool*, *optional*) – MUST a value be present? If no default is provided, this can result in a MissingData exception. Defaults to True
- **short_name** (*str*, *optional*) – short name for use with command line arguments, defaults to None
- **long_name** (*str*, *optional*) – overwrite default name for command line arguments, defaults to None
- **validate** (*Callable*[*Any*, *None*], *optional*) – additional validation function, defaults to None
- **additive** (*bool*, *optional*) – whether to add all found lists together instead of overwrite them, defaults to False

Raises InvalidData: – if default value does not pass validation

creation_counter

int – global count of config elements, used to maintain field order

element_name

str – name of instance, provided by containing class

type_

type – python type of variable that this class represents

subtype

type – python type of list items

action

str – action for argparse

Examples

..doctest:

```
>>> TODO
```

action = 'append'

append (*value*)

Append value to option.

count (*value*)

Count occurrence of value.

extend (*extension*)

Extend value of option with extension.

extract_data_from_parser (*command_line_arguments*)

index (*value*)

Return index of first occurrence of value.

insert (*index*, *value*)
Insert value at index.

pop (*index=-1*)
Remove and return value at index.

remove (*value*)
Remove value.

reverse ()
Reverse list in place.

set_value (*value*)

sort (*key=None*, *reverse=False*)
Sort list in place.

subtype
alias of `str`

type_
alias of `list`

validate (*value*)

class `user_config.StringOption` (*doc=None*, *default=None*, *required=True*, *short_name=None*,
long_name=None, *validate=None*)

Bases: `user_config.ConfigElement`

Configuration element with string value.

type_
alias of `str`

`user_config.with_metaclass` (*meta*, **bases*)

Create a base class with a metaclass.

Drops the middle class upon creation. Source: <http://lucumr.pocoo.org/2013/5/21/porting-to-python-3-redux/>

Parameters

- **meta** (*type*) – meta class or function
- ***bases** (*object*) – parents of class to be created

Raises `None`

Returns

Return type class of type *name*

Examples

..doctest:

```
>>> TODO
```

CHAPTER 2

Indices and tables

- `genindex`
- `modindex`
- `search`

CHAPTER 3

user_config

Manage user configuration for python projects.

For easy and well-documented user-defined configuration.

CHAPTER 4

Links

- home: https://github.com/nihlaeth/user_config
- pypi: <https://pypi.python.org/pypi/user-config>
- documentation: <http://user-config.readthedocs.io/en/latest/>

CHAPTER 5

Badges

-
-
-
-
-
-
-
-
-

CHAPTER 6

Fallback order

1. command line arguments
2. user config files in `~/.config/<app>/config.<extension>`
3. global config files in `/etc/xdg/<app>/config.<extension>`
4. default values

For directories on operating systems than linux, see: <https://github.com/ActiveState/appdirs>

CHAPTER 7

Config format

Supported out of the box: ini

Other config formats can be supported via plug-ins.

CHAPTER 8

Requirements

- Linux, or Os X, or Windows (but not Windows Vista)
- python 2.7 or newer (python 3.6 supported)
- relatively new versions of setuptools and pip (version requirement to follow)

Simple configuration example

```
"""Usage example for user_config."""
from user_config import Config, Section, StringOption, IntegerOption

class MyConfig(Config):

    """This will be displayed in the configuration documentation."""

    application = "my_application"
    author = "me"

    class GeneralSection(Section):
        """General information."""
        name = StringOption(
            doc="your name",
            default="unknown person")
        age = IntegerOption(
            doc="your age",
            required=True)
    general = GeneralSection()
    class AddressSection(Section):
        """shipping address"""
        street = StringOption(
            doc="street including house number",
            required=True)
        city = StringOption(required=True)
    address = AddressSection(required=False)

if __name__ == "__main__":
    CONFIG = MyConfig()
    print("hello there, {}".format(CONFIG.general.name))
```

Command line help text:

```
$ python examples/simple_example.py -h
usage: my_application [-h] [--generate-config] [--city CITY] [--street STREET]
                    [--age AGE] [--name NAME]

This will be displayed in the configuration documentation. Command line
arguments overwrite configuration found in:
/root/.config/my_application/config.cfg /etc/xdg/my_application/config.cfg

optional arguments:
  -h, --help            show this help message and exit
  --generate-config      print a complete configuration file with current settings
  --city CITY            street including house number
  --street STREET        your age
  --age AGE              your name
  --name NAME
```

Command line use with default value:

```
$ python examples/simple_example.py --age 211
hello there, unknown person!
```

Command line use without required value:

```
$ python examples/simple_example.py
Traceback (most recent call last):
  File "examples/simple_example.py", line 29, in <module>
    CONFIG = MyConfig()
  File "/git/user_config/user_config/user_config/__init__.py", line 622, in __init__
    self._elements[element].validate_data(self._data)
  File "/git/user_config/user_config/user_config/__init__.py", line 464, in validate_
↪data
    self._elements[element].validate_data(self._data)
  File "/git/user_config/user_config/user_config/__init__.py", line 380, in validate_
↪data
    self.element_name))
user_config.MissingData: no value was provided for required option age
```

Command line use:

```
$ python examples/simple_example.py --age 211 --name mystery_user
hello there, mystery_user!
```

Generate configuration file:

```
$ python examples/simple_example.py --generate-config
## This will be displayed in the configuration documentation.

[general]
## General information.

## your name
# name = unknown person
name = tamara

## your age
## REQUIRED
# age =
age =
```

```
[address]
## shipping address
## OPTIONAL_SECTION

## street including house number
## REQUIRED
# street =
street =

## REQUIRED
# city =
city =
```

CHAPTER 10

Documentation

```
$ pip install -e ".[doc]"  
$ python setup.py build_sphinx
```

CHAPTER 11

Testing

- pytest
- pytest-cov
- coverage
- codacy-coverage

```
$ python -m pytest --cov=user_config --cov-report xml
```

CHAPTER 12

Planned features

- multi matching sections / wildcard sections
- yaml config format
- json config format
- hook for overwriting config from database or other storage function

u

`user_config`, 5
`user_config.ini`, 3

A

action (user_config.ConfigElement attribute), 6
action (user_config.Section attribute), 10
action (user_config.StringListOption attribute), 11
append() (user_config.StringListOption method), 11
application (user_config.Config attribute), 5, 6
author (user_config.Config attribute), 5, 6

B

BooleanListOption (class in user_config), 5
BooleanOption (class in user_config), 5

C

Config (class in user_config), 5
ConfigElement (class in user_config), 6
ConfigMeta (class in user_config), 8
construct_parser() (user_config.ConfigElement method), 6
construct_parser() (user_config.Section method), 10
count() (user_config.StringListOption method), 11
creation_counter (user_config.ConfigElement attribute), 6, 7
creation_counter (user_config.Section attribute), 10
creation_counter (user_config.StringListOption attribute), 11

E

element_name (user_config.ConfigElement attribute), 6, 7
element_name (user_config.Section attribute), 10
element_name (user_config.StringListOption attribute), 11
extend() (user_config.StringListOption method), 11
extract_data_from_parser() (user_config.ConfigElement method), 7
extract_data_from_parser() (user_config.Section method), 10
extract_data_from_parser() (user_config.StringListOption method), 11

F
