CircuitPython module for the MPL3115A2 barometric pressure & temperature sensor.

CHAPTER 1

Dependencies

This driver depends on:

- [Adafruit CircuitPython](#)
- [Bus Device](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#).

CHAPTER 2

Usage Example

See `examples/simpletest.py` for a demo of the usage.

CHAPTER 3

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 4

Building locally

4.1 Zip release files

To build this library locally you'll need to install the `circuitpython-build-tools` package.

```
python3 -m venv .env
source .env/bin/activate
pip install circuitpython-build-tools
```

Once installed, make sure you are in the virtual environment:

```
source .env/bin/activate
```

Then run the build:

```
circuitpython-build-bundles --filename_prefix adafruit-circuitpython-mpl3115a2 --
↪library_location .
```

4.2 Sphinx documentation

Sphinx is used to build the documentation based on rST files and comments in the code. First, install dependencies (feel free to reuse the virtual environment from above):

```
python3 -m venv .env
source .env/bin/activate
pip install Sphinx sphinx-rtd-theme
```

Now, once you have the virtual environment activated:

```
cd docs
sphinx-build -E -W -b html . _build/html
```

This will output the documentation to `docs/_build/html`. Open the `index.html` in your browser to view them. It will also (due to `-W`) error out on any warning like Travis will. This is a good way to locally verify it will pass.

5.1 Simple test

Ensure your device works with this simple test.

Listing 1: examples/mpl3115a2_simpletest.py

```
1  # Simple demo of the MPL3115A2 sensor.
2  # Will read the pressure and temperature and print them out every second.
3  # Author: Tony DiCola
4  import time
5
6  import board
7  import busio
8
9  import adafruit_mpl3115a2
10
11
12  # Initialize the I2C bus.
13  i2c = busio.I2C(board.SCL, board.SDA)
14
15  # Initialize the MPL3115A2.
16  sensor = adafruit_mpl3115a2.MPL3115A2(i2c)
17  # Alternatively you can specify a different I2C address for the device:
18  #sensor = adafruit_mpl3115a2.MPL3115A2(i2c, address=0x10)
19
20  # You can configure the pressure at sealevel to get better altitude estimates.
21  # This value has to be looked up from your local weather forecast or meteorological
22  # reports. It will change day by day and even hour by hour with weather
23  # changes. Remember altitude estimation from barometric pressure is not exact!
24  # Set this to a value in pascals:
25  sensor.sealevel_pressure = 102250
26
27  # Main loop to read the sensor values and print them every second.
```

(continues on next page)

(continued from previous page)

```
28 while True:
29     pressure = sensor.pressure
30     print('Pressure: {0:0.3f} pascals'.format(pressure))
31     altitude = sensor.altitude
32     print('Altitude: {0:0.3f} meters'.format(altitude))
33     temperature = sensor.temperature
34     print('Temperature: {0:0.3f} degrees Celsius'.format(temperature))
35     time.sleep(1.0)
```

5.2 adafruit_mpl3115a2

CircuitPython module for the MPL3115A2 barometric pressure & temperature sensor. See `examples/simpletest.py` for a demo of the usage.

- Author(s): Tony DiCola

class `adafruit_mpl3115a2.MPL3115A2` (*i2c*, *, *address=96*)

Instance of the MPL3115A2 sensor. Must specify the following parameters when creating an instance of this device: - `i2c`: The I2C bus connected to the sensor.

In addition you can specify the following optional keyword arguments: - `address`: The I2C address of the device if it's different from the default.

altitude

Read the altitude as calculated based on the sensor pressure and previously configured pressure at sea-level. This will return a value in meters. Set the sea-level pressure by updating the `sealevel_pressure` property first to get a more accurate altitude value.

pressure

Read the barometric pressure detected by the sensor in Pascals.

sealevel_pressure

Read and write the pressure at sea-level used to calculate altitude. You must look this up from a local weather or meteorological report for the best accuracy. This is a value in Pascals.

temperature

Read the temperature as measured by the sensor in degrees Celsius.

CHAPTER 6

Indices and tables

- `genindex`
- `modindex`
- `search`
