
aiida-tools

Release 0.2.0

Sep 05, 2019

Contents

1 Installation	3
1.1 Reference	3
Python Module Index	5
Index	7

This package contains tools that make it easier to create calculations and workflows with AiiDA.

- *Installation*

You can install this tool with with pip:

```
pip install aiida-tools
```

1.1 Reference

This module contains general helper functions to aid in developing AiiDA calculations and workchains.

`aiida_tools.check_workchain_step` (*func*)

Decorator for workchain steps that logs (and re-raises) errors occurring within that step.

Contains default keyword arguments to pass classes as input to workchains.

`aiida_tools.workchain_inputs.WORKCHAIN_INPUT_KWARGS = {'serializer': <function get_fullname>}`
Keyword arguments to be passed to `spec.input` for serializing an input which is a class / workchain into a string.

`aiida_tools.workchain_inputs.get_fullname` (*cls_obj*)

Serializes an AiiDA workchain or workfunction to an AiiDA String. For workchains the class identifier is used, workfunctions are serialized in YAML format.

Parameters `cls_obj` (*WorkChain, workfunction*) – Object to be serialized

`aiida_tools.workchain_inputs.load_object` (*cls_name*)

Loads the workchain or workfunction from the serialized string.
