<b>8</b>	<b>Indices and tables</b>	<b>19</b>

Contents:

An ultra-lightweight static site generator.

- Documentation: <https://air.readthedocs.org>.

## Features

- TODO

## Credits

This package was created with [Cookiecutter](#) and the [cookiecutter-pypackage](#) project template.

## CHAPTER 2

---

### Installation

---

At the command line:

```
$ easy_install air
```

Or, if you have virtualenvwrapper installed:

```
$ mkvirtualenv air  
$ pip install air
```

## CHAPTER 3

---

### Usage

---

To use Air in a project:

```
import air
```

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

### Types of Contributions

#### Report Bugs

Report bugs at <https://github.com/audreyt/air/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

#### Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” is open to whoever wants to implement it.

#### Implement Features

Look through the GitHub issues for features. Anything tagged with “feature” is open to whoever wants to implement it.

## Write Documentation

Air could always use more documentation, whether as part of the official Air docs, in docstrings, or even on the web in blog posts, articles, and such.

## Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/audreyr/air/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## Get Started!

Ready to contribute? Here's how to set up *air* for local development.

1. Fork the *air* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/air.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv air
$ cd air/
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass flake8 and the tests, including testing other Python versions with tox:

```
$ flake8 air tests
$ python setup.py test
$ tox
```

To get flake8 and tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 2.6, 2.7, 3.3, 3.4 and 3.5, and for PyPy. Check [https://travis-ci.org/audreyr/air/pull\\_requests](https://travis-ci.org/audreyr/air/pull_requests) and make sure that the tests pass for all supported Python versions.

## Tips

To run a subset of tests:

```
$ python -m unittest tests.test_air
```

### Development Lead

- Audrey Roy Greenfeld <aroy@alum.mit.edu>

### Contributors

None yet. Why not be the first?

## CHAPTER 6

---

History

---

## CHAPTER 7

---

0.1.0 (2015-12-10)

---

- First release on PyPI.

## CHAPTER 8

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
