1.4	License . . . . .	6
1.5	Authors . . . . .	6
<b>2</b>	<b>Indices and tables</b>	<b>7</b>

db2twitter automatically extracts fields from your database, use them to feed a template of tweet and send the tweet. From 0.2 db2twitter stores already sent tweets in a sqlite3 database.

You'll find below anything you need to install, configure or run db2twitter.

## How to install db2twitter

### From sources

From db2twitter 0.6, you will need the [Pillow imaging library](#) in order to send images to Twitter. On a Debian system to install Pillow you could need the libjpeg-dev dependency. Install it with the following command:

```
# apt-get install libjpeg-dev
```

### From PyPI

```
$ pip3 install db2twitter
```

### From sources

- You need at least Python 3.4.
- Untar the tarball and go to the source directory with the following commands:

```
$ tar zxvf db2twitter-0.6.tar.gz  
$ cd db2twitter
```

- Next, to install db2twitter on your computer, type the following command with the root user:

```
$ python3.4 setup.py install  
$ # or  
$ python3.4 setup.py install --install-scripts=/usr/bin
```

## Configure db2twitter

As a prerequisite to use db2twitter, you need a Twitter app. Log in Twitter, go to <https://apps.twitter.com>, create an app and generate the access token.

In order to configure db2twitter, you need to create a db2twitter.ini file (or any name you prefer, finishing with the extension .ini) with the following parameters:

```
[mastodon]
instance_url=https://framapiaf.org
user_credentials=/etc/db2twitter/credentials/db2twitter_usercred.txt
client_credentials=/etc/db2twitter/credentials/db2twitter_clientcred.txt
visibility=public

[twitter]
consumer_key=pPmJ3Bjlb2patls4r7AQW1k1l
consumer_secret=lpj1kvnzbJxfKmeQtaQz18wm94klhaYIw5vaXq01lmwId1wi1j
access_token=1234567897-k8aN3Y5f6cfGgWhhLEuDGad1UPKHnPzkQHmP3q1
access_token_secret=nLQwDFwZR123456789uGE6YXIukY74TmBK6JLEC123456
tweet={} hires a {} https://www.linuxjobs.fr/jobs/{}
hashtags=devops,linux,debian,redhat,python,java,php,mysql,postgresql
upper_first_char=true

[database]
; use the following for PostgreSQL - you need mysql_connector_python
dbconnector=mysql+mysqlconnector
; use the following for PostgreSQL - you need psycopg2 python library
; dbconnector=postgresql+psycopg2
dbhost=localhost
database=yourdatabase
dbuser=yourdatabaseuser
dbpass=V3rYs3cr3t
dbtables=jobs,
jobs_rows=company_name,title,id
;jobs_sqlfilter=status=1

[sqlite]
sqlitepath=/var/lib/db2twitter/db2twitter.db

[media]
image_path=/var/www/mywebsite/images/
; image prefix if all your images is prefixed by a string
; image_prefix=thumb_
; fallback image prefix, e.g if your image does not have the good size for
; Twitter and you have a smaller image with the same name prefixed by a string
; fallback_image_prefix=thumb_

[timer]
days=mon-fri,
hours=0-11,14-17,

[circle]
last_tweets=3
each_time=2
; no_image=true
```

For the [mastodon] section:

- `instance_url`: the url of your Mastodon instance
- `user_credentials`: a file with the user credentials, generated by the command `register_remindr_app`
- `client_credentials`: a file with the client credentials, generated by the command `register_remindr_app`
- `toot_visibility`: any of the valid options for the `visibility` field [here](#). Default is `public`, but `unlisted` prevents flooding the instance's public timeline (which is more polite).

For the [twitter] section:

- `consumer_key`: the Twitter consumer key (see your `apps.twitter.com` webpage)
- `consumer_secret`: the Twitter consumer secret key (see your `apps.twitter.com` webpage)
- `access_token`: the Twitter access token key (see your `apps.twitter.com` webpage)
- `access_token_secret`: the Twitter access token secret key (see your `apps.twitter.com` webpage)
- `tweet`: your tweet template. Should be a Python string format (see <https://docs.python.org/3/library/string.html#format-examples>)
- `hashtags`: a # will be added to these words in your tweets
- `upper_first_char`: use true if you want the first character of your tweets is upper case, false otherwise

For the [database] section:

- `dbconnector`: the SQLAlchemy connector to use to access your database (see examples)
- `dbhost`: the host where the database runs
- `database`: the name of the database
- `dbuser`: the user name to access the database
- `dbpass`: the password to access the database
- `dbtables`: a comma-separated list of tables to use to get data from
- `jobs_rows`: you should replace the `jobs_rows` field by a `[your table]_rows` field. You should have as much fields as the number of specified `dbtables`. This field contains a comma-separated name of the row to get data from
- `jobs_sqlfilter`: a string to pass to SQLAlchemy `filter()` function in order to be a new filter condition on the table you want to parse. Useful e.g if you want to ignore some rows of your table

For the [sqlite] section:

- `sqlitepath`: the path to the sqlite3 database

For the [media] section:

- `image_path`: the path to the directory storing all the images you wish to send with your tweets
- `image_prefix`: prefix string for your images, e.g if your image name in your database field is "cat.png" and the image name on your file system is "thumb\_cat.png"
- `fallback_image_prefix`: prefix to fallback on an image with the same name but prefixed by this string **if and only if** the image size check fails, e.g "cat.png" becomes "fallback\_cat.png"

For the [timer] section:

- `days`: weekdays (mon for monday, thu for thursday, wed for wednesday, tue for tuesday, fri for friday, sat for saturday, sun for sunday) when db2twitter is authorized to send tweets
- `hours`: hours of the day (0 to 23) when db2twitter is authorized to send tweets

For the [circle] section

- `last_tweets`: is the number of last tweets in the sqlite database to circle around
- `each_time`: how many tweets to send at each execution with the circle parameter
- `no_image`: while circling, do not tweet images

## Use db2twitter

After the configuration of db2twitter, just launch the following command:

```
$ db2twitter /path/to/db2twitter.ini
```

To use the circle mode, meaning you will alternatively tweet X tweets of your Y last tweets of your database (see the *Configure db2twitter* section), use the `-circle` option:

```
$ db2twitter -circle /path/to/db2twitter.ini
```

We recommend using db2twitter with cron. The following line in `/etc/crontab` will check for new db rows in your database every minute, build and send tweets accordingly:

```
# m h dom mon dow user  command
* * * * * db2twitter db2twitter /path/to/db2twitter.ini
0 * * * * db2twitter db2twitter --circle /path/to/db2twitter.ini
```
