# CHAPTER 1

---

## The index.rst file

---

This file is located within the *docs* root and creates the table of contents (TOC) for displaying next to the page.

```
.
├── _build
│   └── html
├── _static
│   ├── aboutindex.rst
│   ├── introduction.rst
│   └── numpydocstrings.rst
├── _templates
├── conf.py
├── index.rst ← the index file
├── make.bat
└── Makefile
```

### index.rst

While not mandatory, this helps with navigation quite a bit.

Unfortunately, the index.rst is much more difficult to automate as it is the basic source file of Sphinx.

If a new module is created, its path needs to be written down in the index.rst file for it to show up in the TOC.

---

## Getting Started with this test

---

Sphinx is made with reStructured text. It is a bit different than markdown.

- This is some wild stuff right here.
- directives use “:”
- it is quite annoying to get used to

### 2.1 Some math

$$\frac{\sum_{t=0}^N f(t, k)}{N}$$

That was some math. I bet it looks cool. Every tool I have for previewing this sucks.

### 2.2 Using markdown

Markdown may be used at the cost of some advanced functionalities

Blog post of some nerd ranting about it

#### Main points:

- Markdown has no set standard
  - There are a million interpreters with millions of syntax
- Harder to expand
  - May rely on CSS stuff
  - Breaks portability for other tools

*Basically,*

**reStructured text is awful to write but is more stable and standard for documentation**

---

## Docstring Format

---

Back in the day, docstrings used to be just plain reStructuredText inside of docstrings.

- It was very gross.
- For everyone.

### 3.1 Solution

Numpy Project and Google defined a non-gross docstring formats that everyone accepts and Sphinx recognizes.

- Sphinx needs an addon called “Napoleon” to interpret them.
- It is not a problem. This is defined in the doc’s conf.py.

Numpy docstrings Example

conf.py:

```
extensions = [  
    'sphinx.ext.autodoc',  
    'sphinx.ext.intersphinx',  
    'sphinx.ext.todo',  
    'sphinx.ext.coverage',  
    'sphinx.ext.mathjax',  
    'sphinx.ext.ifconfig',  
    'sphinx.ext.viewcode',  
    'sphinx.ext.githubpages',  
    'sphinx.ext.napoleon', # <- Here is Napoleon  
]
```

See also: Google docstrings Example

The code in `sphinxtest.alpha` and `sphinxtest.beta` utilize this Docstring format and are automatically generated.

---

## Testing the Code

---

The `Foo` is an extremely powerful class. The number of bar power defined by its `power`, which is a `int`.

---

`alpha`

The alpha `__init__` docstr

---

## 4.1 sphinxtest.alpha package

### 4.1.1 Module contents

#### The alpha `__init__` docstr

**class** `Foo` (`barPower`)

Bases: `object`

This is the Foo class.

Create powerful Foo objects for generating foobars

**power** (`int`)

Amount of bar energy contained in this Foo instance.

**Parameters** `barPower` (`int`) – The bar energy to be contained in this Foo instance.

**Raises** `AssertionError` – If `barPower` is less than 6, crap itself.

#### Examples

```
>>> from test import Foo
>>> x = Foo(6)
>>> x.bar()
foobar0
```

(continues on next page)

(continued from previous page)

```
foobar1  
foobar2  
foobar3  
foobar4  
foobar5
```

**bar ()**

Generate foobars based on bar energy.

## 5.1 Subpackages

### 5.1.1 sphinxtest.beta package

#### Module contents

#### The `__init__` docstr

**class** `Waldo` (*pos*)

Bases: `object`

This is the Waldo class

#### Parameters

- **pos** (*tuple* (`int`, `int`, `int`)) : – Waldo’s current position
- **pos** – Start Waldo in this position

**whereIsHe** ()

Show Waldo’s Position

**Returns** 3 dimension coordinate of Waldo’s position

**Return type** `list`

#### Example

```
>>> from sphinxtest.beta import Waldo
>>> w=Waldo([2,3,5])
>>> w.whereIsHe()
[2,3,5]
```

## 5.2 Module contents

### 5.2.1 Top level doctstring

## CHAPTER 6

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`

### S

`sphinxtest`, [7](#)  
`sphinxtest.alpha`, [4](#)  
`sphinxtest.beta`, [6](#)

## B

`bar()` (Foo method), 5

## F

`Foo` (class in `sphintest.alpha`), 4

## P

`power` (Foo attribute), 4

## S

`sphintest` (module), 7

`sphintest.alpha` (module), 4

`sphintest.beta` (module), 6

## W

`Waldo` (class in `sphintest.beta`), 6

`whereIsHe()` (Waldo method), 6
