
django-dash Documentation

Release 0.1.4

Artur Barseghyan <artur.barseghyan@gmail.com>

November 29, 2013

Contents

django-dash (later on named Dash) is a customisable, modular dashboard application framework for Django.

Dash allows users to create their own custom dashboards. Supports theming (in Dash themes are called layouts) and multiple workspaces. Dash comes with extensive pythonic API which allows developers to create new Dash plugins, as well as to modify bundled ones.

To make a clearer association, think of Android for tablets (shortcuts, widgets and apps) or Windows 8 for tablets or desktops.

Dash inherits all those concepts and makes it possible to implement a dashboard system for Django applications with minimal efforts.

Prerequisites

- Django 1.5.+
- Python 2.6.8+, 2.7.+, 3.3.+

Key concepts

- Each layout (theme) consist of placeholders. Each plugin widget has its' own specific HTML/JavaScript/CSS.
- There might be multiple themes implemented and installed, but only one can be active for a certain user. Default layout is chosen system wide, but each user (if has an appropriate permission) can choose his preferred layout.
- Placeholder is a space, in which the plugin widgets are placed.
- Placeholders are rectangles consisting of cells. Each placeholder has its' own custom number of rows and columns.
- Workspace is just another named dashboard. Users switch between workspaces in navigation. Amount of workspaces is unlimited.
- Plugin is a (Django) micro app. Most heavy work should happen in plugin. Plugin may have its' own views, urls, etc. Rendering happens with use of plugin widgets.
- Plugin widgets are mainly responsible for rendering of the plugin data. Each plugin widget has its' own specific HTML/JavaScript/CSS. A single plugin widget is registered for a triple (layout, placeholder, plugin).
- Public dashboard (implemented as a contrib app, which makes it optional) allows users to make their workspaces public. If user chooses to make his dashboard public, default workspace becomes public. As for non-default workspaces, user can still make each of them private or public.

Main features

- Customisable layouts (aka theming).
- Multiple workspaces.
- Tunable access permissions to plugins.
- Public dashboards (as a contrib app).

Installation

1. Install latest stable version from PyPI:

```
$ pip install django-dash
```

- Or latest stable version from GitHub:

```
$ pip install -e git+https://github.com/barseghyanartur/django-dash@stable#egg=django-dash
```

- Or latest stable version from BitBucket:

```
$ pip install -e hg+https://bitbucket.org/barseghyanartur/django-dash@stable#egg=django-dash
```

2. Add *dash* to `INSTALLED_APPS` of the your projects' Django settings. Furthermore, all layouts and plugins to be used, shall be added to the `INSTALLED_APPS` as well.

```
>>> INSTALLED_APPS = (  
>>>     # ...  
>>>     'dash',  
>>>     'dash.contrib.layouts.android',  
>>>     'dash.contrib.layouts.windows8',  
>>>     'dash.contrib.plugins.dummy',  
>>>     'dash.contrib.plugins.memo',  
>>>     'dash.contrib.plugins.news',  
>>>     'dash.contrib.plugins.rss_feed',  
>>>     'dash.contrib.plugins.url',  
>>>     'dash.contrib.plugins.video',  
>>>     'dash.contrib.plugins.weather',  
>>>     # ...  
>>> )
```

3. Make sure that `django.core.context_processors.request` is in `TEMPLATE_CONTEXT_PROCESSORS`.

Demo

In order to be able to quickly evaluate the *django-dash*, a demo app (with a quick installer) has been created (works on Ubuntu/Debian, may work on other Linux systems as well, although not guaranteed). Follow the instructions below for having the demo running within a minute.

Grab the latest *django_dash_example_app_installer.sh*:

```
$ wget https://raw.githubusercontent.com/barseghyanartur/django-dash/stable/example/django_dash_example_app_installer.sh
```

Create a new- or switch to existing- virtual environment:

```
$ virtualenv dash
```

```
$ source dash/bin/activate
```

Assign execute rights to the installer and run the *django_dash_example_app_installer.sh*:

```
$ chmod +x django_dash_example_app_installer.sh
```

```
$ ./django_dash_example_app_installer.sh
```

Open your browser and test the app.

Dashboard:

- URL: <http://127.0.0.1:8001/dashboard/>
- Admin username: test_admin
- Admin password: test

Django admin interface:

- URL: <http://127.0.0.1:8001/administration/>
- Admin username: test_admin
- Admin password: test

Take a look at the templates in “example/example/templates” directory for getting a better idea of how to transform your own- or thirty-part- templates into Dash templates.

See the documentation for some screen shots <http://pythonhosted.org/django-dash/#screenshots>

Creating a new layout

Dash comes with several bundled layouts. Do check their source code as example.

Let's say, our imaginary layout has two placeholders. One large placeholder for all kinds of widgets (called *main*) and a tiny one for shortcuts (called *shortcuts*).

Placeholder *main*:

- Single cell size : 150 x 110 pixels
- Dimensions : 6 cols, 5 rows

Placeholder *shortcuts*:

- Single cell size : 60 x 55 pixels
- Dimensions : 1 cols, 10 rows

See the figure below to get an idea of what placeholders are:

- Placeholder *main* consists of cells from 11 to 56.
- Placeholder *shortcuts* consists of cells from 1 to 10.

A single plugin widget may occupy one or more cells. Plugin widgets are rectangles.

To make it clear, see following cases:

- Plugin widget has 2 cols and 1 row. Then, for example, it may occupy cells (11 and 12).
- Plugin widget has 2 cols and 2 rows. Then, for example, it may occupy cells (11, 12, 21 and 22).
- Plugin widget has 1 col and 3 rows. Then, for example, it may occupy cells (11, 21 and 31).
- Plugin widget has 4 cols and 3 rows. Then, for example, it may occupy cells (22, 23, 24, 25, 32, 33, 34, 35, 42, 43, 44 and 45).

```

>>>                                     `main`                                     `shortcuts`
>>>-----
>>>|           |           |           |           |           |           | | 1 |
>>>|           |           |           |           |           |           | |   |
>>>|    11     |    12     |    13     |    14     |    15     |    16     | |----|
>>>|           |           |           |           |           |           | | 2 |
>>>|           |           |           |           |           |           | |   |
>>>-----
>>>|           |           |           |           |           |           | |   |

```

```

>>>|      |      |      |      |      |      |      |      |      |      |
>>>|  21  |    22  |    23  |    24  |    25  |    26  |  -----  |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>-----
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|  31  |    32  |    33  |    34  |    35  |    36  |  -----  |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>-----
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|  41  |    42  |    43  |    44  |    45  |    46  |  -----  |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>-----
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|  51  |    52  |    53  |    54  |    55  |    56  |  -----  |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>|      |      |      |      |      |      |      |      |      |      |
>>>-----

```

There are some rules/guideles you should follow.

Let's assume that layout is named *example*. The layout directory should then have the following structure.

```

>>> path/to/layout/example/
>>> -- static
>>> |   -- css
>>> |   |   -- dash_layout_example.css # Contains layout-specific CSS
>>> |   -- images
>>> |   -- js
>>> |       -- dash_layout_example.js # Contains layout specific JavaScripts
>>> -- templates
>>> |   -- example
>>> |       -- edit_layout.html # Master edit layout
>>> |       -- view_layout.html # Master view layout
>>> -- __init__.py
>>> -- dash_layouts.py # Where Layouts and Placeholders are defined and registered

```

Layout and placeholder classes should be placed in the *dash_layouts.py* file.

Each layout should be put into the `INSTALLED_APPS` of your Django projects' settings module.

```

>>> INSTALLED_APPS = (
>>>     # ...
>>>     'path.to.layout.example',
>>>     # ...
>>> )

```

6.1 path/to/layout/example/dash_layouts.py

Step by step review of a how to create and register a layout and placeholders. Note, that Dash autodiscovers your layouts by name of the file *dash_layouts.py*. The module, in which the layouts are defined, has to be named *dash_layouts.py*.

Required imports.

```
>>> from dash.base import BaseDashboardLayout, BaseDashboardPlaceholder
>>> from dash.base import layout_registry
```

Defining the Main placeholder.

```
>>> class ExampleMainPlaceholder(BaseDashboardPlaceholder):
>>>     uid = 'main' # Unique ID of the placeholder.
>>>     cols = 6 # Number of columns in the placeholder.
>>>     rows = 5 # Number of rows in the placeholder.
>>>     cell_width = 150 # Width of a single cell in the placeholder.
>>>     cell_height = 110 # Height of a single cell in the placeholder.
```

Defining the Shortcuts placeholder.

```
>>> class ExampleShortcutsPlaceholder(BaseDashboardPlaceholder):
>>>     uid = 'shortcuts' # UID of the placeholder.
>>>     cols = 1 # Number of columns in the placeholder.
>>>     rows = 10 # Number of rows in the placeholder.
>>>     cell_width = 60 # Width of a single cell in the placeholder.
>>>     cell_height = 55 # Height of a single cell in the placeholder.
```

Defining and registering the Layout.

```
>>> class ExampleLayout(BaseDashboardLayout):
>>>     uid = 'example' # Layout UID.
>>>     name = 'Example' # Layout name.
>>>
>>>     # View template. Master template used in view mode.
>>>     view_template_name = 'example/view_layout.html'
>>>
>>>     # Edit template. Master template used in edit mode.
>>>     edit_template_name = 'example/edit_layout.html'
>>>
>>>     # All placeholders listed. Note, that placeholders are rendered in the
>>>     # order specified here.
>>>     placeholders = [ExampleMainPlaceholder, ExampleShortcutsPlaceholder]
>>>
>>>     # Cell units used in the entire layout. Allowed values are: 'px', 'pt',
>>>     # 'em' or '%'. In the ``ExampleMainPlaceholder`` cell_width is set to 150.
>>>     # It means that in this particular case its' actual width would be '150px'.
>>>     cell_units = 'px'
>>>
>>>     # Layout specific CSS.
>>>     media_css = ('css/dash_layout_example.css',)
>>>
>>>     # Layout specific JS.
>>>     media_js = ('js/dash_layout_example.js',)
>>>
>>>     # Registering the layout.
>>>     layout_registry.register(ExampleLayout)
```

6.2 HTML templates

You custom layout should be interited from base layout templates (view or edit). Both view and edit layouts share a lot of things, still edit layout is a bit more “heavy”.

- `view_layout.html` should inherit from “`dash/layouts/base_view_layout.html`”.
- `edit_layout.html` should inherit from “`dash/layouts/base_edit_layout.html`”.

Both “`dash/layouts/base_view_layout.html`” and “`dash/layouts/base_edit_layout.html`” inherit from “`dash/layouts/base_layout.html`”, which in its turn inherits from “`dash/base.html`”.

Note, that when rendered to HTML, each Dash template, gets a body class “`layout`” + layouts’ unique identifier (UID). So, the `ExampleLayout` layout would automatically get the class “`layout-example`”.

```
<body class="layout-example">
```

In case of Android layout (UID “`android`”) it would be as follows.

```
<body class="layout-android">
```

Base your layout specific custom CSS on presence of those classes.

Same goes for Placeholders. Each placeholder gets `id_` + placeholders’ UID and the classes “`placeholder`” and “`placeholder-`” + placeholders’ UID. So, the `ExampleMainPlaceholder` would look as follows.

```
<div id="id_main" class="placeholder placeholder-main">
```

And the `ExampleShortcutsPlaceholder` placeholder would look as follows.

```
<div id="id_shortcuts" class="placeholder placeholder-shortcuts">
```

Same goes for plugin widgets. Apart from some other classes that each plugin widget would get for positioning, it gets the “`plugin`” and “`plugin-`” + plugin UID. See the following example (for the plugin `Dummy` with UID “`dummy`”). Each plugin also gets an automatic UID on the moment when rendered. In the example below it’s the “`p6d06f17d-e142-4f45-b9c1-893c38fc2b01`”.

```
<div id="p6d06f17d-e142-4f45-b9c1-893c38fc2b01" class="plugin plugin-dummy">
```

Layout, placeholder, plugin and plugin widget have properties for getting their HTML specific classes and IDs.

Layout (instance)

```
>>> layout.html_class
```

Placeholder (instance)

```
>>> placeholder.html_id
>>> placeholder.html_class
```

Plugin (instance)

```
>>> plugin.html_id
>>> plugin.html_class
```

Plugin widget (static call)

```
>>> plugin_widget.html_class # Static one
```

Creating a new plugin

Dash comes with several bundled plugins. Do check their source code as example.

Making of a plugin or a plugin widget is quite simple, although there are some rules/guideles you should follow.

Let's assume that plugin is named *sample_memo*. The plugin directory should then have the following structure.

Note, that you are advised to prefix all your plugin specific media files with *dash_plugin_* for the sake of common sense.

```
>>> path/to/plugin/sample_memo/
>>> -- static
>>> |   -- css
>>> | |   -- dash_plugin_sample_memo.css # Plugin specific CSS
>>> |   -- images
>>> |   -- js
>>> |       -- dash_plugin_sample_memo.js # Plugin specific JavaScripts
>>> -- templates
>>> |   -- sample_memo
>>> |       -- render_main.html # Plugin widget templ. for 'main' Placeholder
>>> |       -- render_short.html # Plugin widget templ. for 'shortcuts' Placeholder
>>> -- __init__.py
>>> -- dash_plugins.py # Where plugins and widgets are defined and registered
>>> -- dash_widgets.py # Where the plugin widgets are defined
>>> -- forms.py # Plugin configuration form
```

In some cases, you would need plugin specific overridable settings (see `dash.contrib.plugins.weather` plugin as an example. You are advised to write your settings in such a way, that variables of your Django project settings module would have *DASH_PLUGIN_* prefix.

7.1 path/to/plugin/sample_memo/dash_plugins.py

Step by step review of a how to create and register a plugin and plugin widgets. Note, that Dash autodiscovers your plugins if you place them into a file named *dash_plugins.py* of any Django app listed in `INSTALLED_APPS` of your Django projects' settings module.

7.1.1 Define and register the plugin

Required imports.

```
>>> from dash.base import BaseDashboardPlugin, plugin_registry
>>> from path.to.plugin.sample_memo.forms import SampleMemoForm
```

Defining the Sample Memo plugin.

```
>>> class SampleMemoPlugin(BaseDashboardPlugin):
>>>     uid = 'sample_memo' # Plugin UID
>>>     name = _("Memo") # Plugin name
>>>     group = _("Memo") # Group to which the plugin belongs to
>>>     form = SampleMemoForm # Plugin forms are explained later
```

Registering the Sample Memo plugin.

```
>>> plugin_registry.register(SampleMemoPlugin)
```

7.1.2 Register plugin widgets

Plugin widgets are defined in *dash_widgets.py* module (described later), but registered in the *dash_plugins.py*, which is autodiscovered by Dash.

Required imports.

```
>>> from dash.base import plugin_widget_registry
>>> from path.to.plugin.sample_memo.dash_widgets import (
>>>     SampleMemoExampleMainWidget, SampleMemoExampleShortcutWidget
>>> )
```

Registering the Sample Memo plugin widgets for Layout *example*.

```
>>> plugin_widget_registry.register(SampleMemoExampleMainWidget)
>>> plugin_widget_registry.register(SampleMemoExampleShortcutWidget)
```

7.2 path/to/plugin/sample_memo/dash_widgets.py

Why to have another file for defining widgets? Just to keep the code clean and less messy, although you could perfectly define all your plugin widgets in the module *dash_plugins.py*, it's recommended to keep it separate.

Take into consideration, that *dash_widgets.py* is not an autodiscovered file pattern. All your plugin widgets should be registered in modules named *dash_plugins.py*.

Required imports.

```
>>> from django.template.loader import render_to_string
>>> from dash.base import BaseDashboardPluginWidget
```

Memo plugin widget for Example layout (Placeholder *main*).

```
>>> class SampleExampleMemoExampleMainWidget(BaseDashboardPluginWidget):
>>>     layout_uid = 'example' # Layout for which the widget is written
>>>     placeholder_uid = 'main' # Placeholder within the layout for which
>>>                             # the widget is written
>>>     plugin_uid = 'sample_memo' # Plugin for which the widget is written
>>>     cols = 2 # Number of widget columns
```

```

>>> rows = 2 # Number of widget rows
>>>
>>> def render(self, request=None):
>>>     context = {'plugin': self.plugin}
>>>     return render_to_string('sample_memo/render_main.html', context)

```

Memo plugin widget for Example layout (Placeholder *shortcuts*).

```

>>> class SampleMemoExampleShortcutWidget(SampleMemoExampleMainWidget):
>>>     placeholder_uid = 'shortcuts'
>>>     cols = 1
>>>     rows = 1
>>>
>>> def render(self, request=None):
>>>     context = {'plugin': self.plugin}
>>>     return render_to_string('sample_memo/render_shortcuts.html', context)

```

7.3 path/to/plugin/sample_memo/forms.py

What are the plugin forms? Very simple - if plugin is configurable, it has a form. If you need to have a custom CSS or a JavaScript included when rendering a specific form, use Django's class Media directive in the form.

Required imports.

```

>>> from django import forms
>>> from dash.base import DashboardPluginFormBase

```

Memo form (for *Sample Memo* plugin).

```

>>> class SampleMemoForm(forms.Form, DashboardPluginFormBase):
>>>     plugin_data_fields = [
>>>         ("title", ""),
>>>         ("text", "")
>>>     ]
>>>
>>>     title = forms.CharField(label=_("Title"), required=False)
>>>     text = forms.CharField(label=_("Text"), required=True, \
>>>                             widget=forms.widgets.Textarea)
>>>
>>>     def __init__(self, *args, **kwargs):
>>>         super(MemoForm, self).__init__(*args, **kwargs)

```

Now, that everything is ready, make sure your that both layout and the plugin modules are added to `INSTALLED_APPS` for your projects' Django settings.

```

>>> INSTALLED_APPS = (
>>>     # ...
>>>     'path.to.layout.example',
>>>     'path.to.plugin.sample_memo',
>>>     # ...
>>> )

```

After it's done, go to terminal and type the following command.

```
$ ./manage.py dash_sync_plugins
```

If your HTTP server is running, you would then be able to access your dashboard.

- View URL: <http://127.0.0.1:8000/dashboard/>
- Edit URL: <http://127.0.0.1:8000/dashboard/edit/>

Note, that you have to be logged in, in order to use the dashboard. If your new plugin doesn't appear, set the `DASH_DEBUG` to `True` in your Django's local settings module, re-run your code and check console for error notifications.

Permissions

Plugin system allows administrators to specify the access rights to every plugin. Dash permissions are based on Django Users and User Groups. Access rights are manageable via Django admin (/administration/dash/dashboardplugin/). Note, that your admin URL prefix may vary from the one given in example (it's usually "/admin/", while in example it's "/administration/"). If user doesn't have the rights to access plugin, it doesn't appear on his dashboard even if has been added to it (imagine, you have once granted the right to use the news plugin to all users, but later on decided to limit it to Staff members group only). Note, that superusers have access to all plugins.

```
>>>          Plugin access rights management interface in Django admin
>>>-----
>>>| 'Plugin'                | 'Users'                | 'Groups'                |
>>>-----
>>>| Video (big_video)       | John Doe                | Dashboard users         |
>>>-----
>>>| TinyMCE memo (tinymce_memo) |                        | Dashboard users         |
>>>-----
>>>| News (news)             | Oscar, John Doe        | Staff members           |
>>>-----
>>>| URL (url)               |                        | Dashboard users         |
>>>-----
>>>| Video (video)           |                        | Dashboard users         |
>>>-----
>>>| Dummy (dummy)           |                        | Testers                  |
>>>-----
>>>| Dummy (large_dummy)     |                        | Testers                  |
>>>-----
>>>| Memo (big_memo)         |                        | Dashboard users         |
>>>-----
```

Management commands

There are several management commands.

- *dash_find_broken_dashboard_entries*. Find broken dashboard entries that occur when some plugin which did exist in the system, no longer exists.
- *dash_sync_plugins*. Should be ran each time a new plugin is being added to the Dash.
- *dash_update_plugin_data*. A mechanism to update existing plugin data in case if it had become invalid after a change in a plugin. In order for it to work, each plugin should implement and `update` method, in which the data update happens.

Tuning

There are number of Dash settings you can override in the settings module of your Django project:

- *DASH_RESTRICT_PLUGIN_ACCESS* (bool): If set to True, (Django) permission system for dash plugins is enabled. Defaults to True. Setting this to False makes all plugins available for all users.
- *DASH_ACTIVE_LAYOUT* (str): Active (default) layout UID. Defaults to “android”.
- *DASH_LAYOUT_CELL_UNITS* (str): Allowed values for layout cell units. Defaults to (“em”, “px”, “pt”, “%”).
- *DASH_DISPLAY_AUTH_LINK* (bool): If set to True, the log out link is shown in the Dash drop-down menu. Defaults to True.

For tuning of specific contrib plugin, see the docs in the plugin directory.

Styling tips

Font Awesome is used for icons. As a convention, all icons of font-awesome are placed within a span. Next to their original class, they all should be getting an extra class “iconic”. Follow that rule when making a new layout or a plugin (HTML). It allows to make the styling easy, since icon colours could be then changed within no time.

Bundled plugins and layouts

Dash ships with number of bundled (demo) plugins and layouts that are mainly made to demonstrate its' abilities. In order to work among various layouts (themes), each plugin has a single widget registered for a single layout. It's possible to unregister a bundled widget and replace it with a custom one.

12.1 Bundled plugins

Below a short overview of the plugins. See the README.rst file in directory of each plugin for details.

- Dummy plugin. Mainly made for quick testing. Still, is perfect example of how to write a plugin and widgets. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/dummy>
- Memo plugin. Allows users to put short notes on their dashboard. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/memo>
- News plugin. Shows how to embed your Django news application (front-end part of it) into a Dash plugin widget. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/news>
- RSS feed plugin. Allows users to put any RSS feed right into the dashboard. https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/rss_feed
- URL plugin. Allows users to put links to their dashboard. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/url>
- Video plugin. Allows users to put YouTube or Vimeo videos to their dashboard. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/video>
- Weather plugin. Allows to put a weather widget into dashboard. <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/plugins/weather>

12.2 Bundled layouts

Below a short overview of the layouts. See the README.rst file in directory of each layout for details.

- Android (like) layout. Has two placeholders: main (6 cols x 5 rows, each block sized 150x110 px) and shortcuts (1 col x 10 rows, each block sized 60x55 px). <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/layouts/android>

- Windows 8 (like) layout. Has two placeholders: main (6 cols x 4 rows, each block sized 140x135 px) and sidebar (2 cols x 4 rows, each block sized 140x135 px). <https://github.com/barseghyanartur/django-dash/tree/stable/src/dash/contrib/layouts/windows8>

Naming conventions

Although you are free to name your plugins and widgets as you want (except that you should comply with PEP <http://www.python.org/dev/peps/pep-0008/#function-names>), there are some naming conventions introduced, that you are recommended to follow.

- TinyExampleWidget: 1x1
- SmallExampleWidget: 2x2
- ExampleWidget: 3x3
- BigExampleWidget: 4x4
- HugeExampleWidget: 5x5
- GiganticExampleWidget: 6x6

When making non-square widgets (2x1, 1x2, 3x1, 1x3), add *Portrait* and *Landscape* to the name for better identification.

```

dash.contrib.plugins.news.models module

```
class dash.contrib.plugins.news.models.NewsItem (*args, **kwargs)
```

Bases: django.db.models.base.Model, slim.models.Slim

News item.

title Title of the news item. body Teaser of the news item. WYSIWYG. image Headline image of the news item. date_published Date item is published. On creating defaults to datetime.datetime.now. language Language.

exception DoesNotExist

Bases: django.core.exceptions.ObjectDoesNotExist

exception NewsItem.MultipleObjectsReturned

Bases: django.core.exceptions.MultipleObjectsReturned

```
NewsItem.admin_image_preview()
```

Preview of the image. For admin use mainly.

Return str

```
NewsItem.get_absolute_url (*moreargs, **morekwargs)
```

```
NewsItem.get_language_display (*moreargs, **morekwargs)
```

```
NewsItem.objects = <django.db.models.manager.Manager object at 0x4332cd0>
```

```
NewsItem.translation_of
```

```
NewsItem.translations
```

dash.contrib.plugins.news.urls module

dash.contrib.plugins.news.views module

```
dash.contrib.plugins.news.views.browse (*args, **kwargs)
```

In the template, we show all available NewsItems for current language.

Parameters

- **request** (django.http.HttpRequest) –
- **template_name** (str) –

Return django.http.HttpResponse

`dash.contrib.plugins.news.views.detail` (*request*, *slug*, *template_name='news/detail.html'*,
template_name_ajax='news/detail_ajax.html')

News item detail. In the template, we show the title and the body of the News item and links to all its' all available translations.

Parameters

- **request** (*django.http.HttpRequest*) –
- **slug** (*str*) – Foo item slug.
- **template_name** (*str*) –

Return django.http.HttpResponse

Module contents

dash.contrib.plugins.weather package

Submodules

dash.contrib.plugins.weather.conf module

```
dash.contrib.plugins.weather.conf.get_setting (setting, override=None)
```

Get a setting from dash.contrib.plugins.weather conf module, falling back to the default.

If override is not None, it will be used instead of the setting.

Parameters

- **setting** – String with setting name
- **override** – Value to use when no setting is available. Defaults to None.

Returns Setting value.

dash.contrib.plugins.weather.dash_plugins module

```
class dash.contrib.plugins.weather.dash_plugins.WeatherPlugin (layout_uid,
placeholder_uid,
workspace=None,
user=None, position=None)
```

Bases: dash.base.BaseDashboardPlugin

Weather dashboard plugin.

form

alias of WeatherForm

```
group = <django.utils.functional.__proxy__ object at 0x2d39e50>
```

```
name = <django.utils.functional.__proxy__ object at 0x2d39d10>
```

```
post_processor ()
```

If no text available, use dummy.

```
uid = 'weather'
```

dash.contrib.plugins.weather.dash_widgets module

class `dash.contrib.plugins.weather.dash_widgets.WeatherAndroidMainWidget` (*plugin*)
 Bases: `dash.base.BaseDashboardPluginWidget`

Weather plugin widget for Android layout (placeholder *main*).

`cols = 2`

`layout_uid = 'android'`

`media_css = ['css/dash_plugin_weather.css']`

`placeholder_uid = 'main'`

`plugin_uid = 'weather'`

`render` (*request=None*)

`rows = 2`

class `dash.contrib.plugins.weather.dash_widgets.BigWeatherAndroidMainWidget` (*plugin*)

Bases: `dash.contrib.plugins.weather.dash_widgets.WeatherAndroidMainWidget`

Big memo plugin widget for Android layout (placeholder *main*).

`cols = 3`

`plugin_uid = 'big_weather'`

`rows = 3`

dash.contrib.plugins.weather.defaults module**dash.contrib.plugins.weather.forms module**

class `dash.contrib.plugins.weather.forms.WeatherForm` (**args, **kwargs*)

Bases: `django.forms.forms.Form`, `dash.base.DashboardPluginFormBase`

Form for main WeatherPlugin.

`base_fields = {'custom_title': <django.forms.fields.CharField object at 0x40eb810>, 'show_feed_title': <django.forms`

`media`

`plugin_data_fields = [('custom_title', ''), ('show_title', True), ('cache_for', 3600), ('public_ip', ''), ('weather_data_`

`save_plugin_data` ()

For showing the weather, we need an IP address. Although we don't make it possible for the user to specify it manually, we silently obtain it and save into the plugin data.

dash.contrib.plugins.weather.settings module**Module contents****Module contents**

Module contents

dash.management package

Subpackages

dash.management.commands package

Submodules

dash.management.commands.dash_find_broken_dashboard_entries module

class `dash.management.commands.dash_find_broken_dashboard_entries.Command`

Bases: `django.core.management.base.BaseCommand`

handle (**args*, ***options*)

Adds the missing plugins to database (`dash.models.DashboardPlugin`). This command shall be ran every time a developer adds a new plugin.

dash.management.commands.dash_sync_plugins module

class `dash.management.commands.dash_sync_plugins.Command`

Bases: `django.core.management.base.BaseCommand`

handle (**args*, ***options*)

Adds the missing plugins to database (`dash.models.DashboardPlugin`). This command shall be ran every time a developer adds a new plugin.

dash.management.commands.dash_update_plugin_data module

class `dash.management.commands.dash_update_plugin_data.Command`

Bases: `django.core.management.base.BaseCommand`

handle (**args*, ***options*)

Updates the plugin data for all dashboard entries of all users. Rules for update are specified in the plugin itself.

This command shall be ran if significant changes have been made to the system for which the data shall be updated.

```
class dash.base.BaseDashboardLayout (user=None)
```

```
Bases: object
```

Base layout.

Layouts consist of placeholders.

Properties

- *uid* (str): Layout unique identifier (globally).
- *name* (str): Layout name.
- *description* (str): Layout description.
- *placeholders* (iterable): Iterable (list, tuple or set) of *dash.base.BaseDashboardPlaceholder* subclasses.
- *view_template_name* (str): Template name used to render the layout (view).
- *edit_template_name* (str): Template named used to render the layout (edit).
- *html_classes* (str): Extra HTML class that layout should get.
- *cell_units* (str):
- *media_css* (list): List all specific stylesheets.
- *media_js* (list): List all specific javascripts.

```
cell_units = None
```

collect_widget_media (*dashboard_entries*)

Collects the widget media files.

Parameters **dashboard_entries** (*iterable*) – Iterable of `dash.models.DashboardEntry` instances.

Return list

description = None

edit_template_name = None

edit_template_name_ajax = None

get_css (*placeholders*)

Gets placeholder specific css.

Parameters **placeholders** (*iterable*) – Iterable of `dash.base.BaseDashboardPlaceholder` subclassed instances.

Return str

get_edit_template_name (*request=None*)

get_grouped_dashboard_entries (*dashboard_entries*)

Gets dashboard entries grouped by placeholder.

Parameters **dashboard_entries** (*iterable*) – Iterable of `dash.models.DashboardEntry` objects.

Return list

get_media_css ()

Gets all CSS media files (for the layout + plugins).

Return list

get_media_js ()

Gets all JavaScript media files (for the layout + plugins).

Return list

get_placeholder (*uid, default=None*)

get_placeholder_instances (*dashboard_entries=None, workspace=None, request=None*)

Gets placeholder instances.

Parameters

- **dashboard_entries** (*iterable*) – Iterable of `dash.models.DashboardEntry` objects.
- **request** (*django.http.HttpRequest*) –

Return list List of `dash.base.BaseDashboardPlaceholder` subclassed instances.

get_placeholder_uids (*request=None*)

Gets the list of placeholder uids.

Parameters **request** (*django.http.HttpRequest*) –

Return list

get_placeholders (*request=None*)

Gets the list of placeholders registered for the layout.

Parameters **request** (*django.http.HttpRequest*) –

Return iterable List of placeholder classes. Override in your layout if you need a custom behaviour.

`get_view_template_name` (*request=None*)

`html_class`

Class used in the HTML.

Return str

`html_classes` = []

`media_css` = []

`media_js` = []

`name` = None

`placeholders` = []

`primary_html_class`

`render_for_edit` (*dashboard_entries=None, workspace=None, request=None*)

Renders the layout.

Parameters

- `dashboard_entries` (*iterable*) –
- `workspace` (*str*) – Current workspace.
- `request` (*django.http.HttpRequest*) –

Return str

`render_for_view` (*dashboard_entries=None, workspace=None, request=None*)

Renders the layout.

Parameters

- `dashboard_entries` (*iterable*) –
- `workspace` (*str*) – Current workspace.
- `request` (*django.http.HttpRequest*) –

Return str

`uid` = None

`view_template_name` = None

`view_template_name_ajax` = None

class `dash.base.BaseDashboardPlaceholder` (*layout*)

Bases: `object`

Base placeholder.

Properties

- `uid` (*str*): Unique identifier (shouldn't repeat within a single layout).

`cell_height` = None

`cell_units`

`cell_width` = None

`cols` = None

css

CSS styles for the placeholders and plugins. The placeholder dimensions as well as columns sizes, should be handled here. Since we are in a placeholder and a placeholder has a defined number of rows and columns and each reender has just a fixed amount of rows and columns defined, we can render the top left corners generic css classes.

Cells do NOT have margins or paddings. This is essential (since all the plugins are positioned absolutely). If you want to have padding in your plugin widget, specify the *plugin-content-wrapper* class style in your specific layout/theme.

Example

```
.placeholder .plugin .plugin-content-wrapper { padding: 5px;
}
```

Return str

```
edit_template_name = ''
```

```
get_edit_template_name ()
```

```
get_view_template_name ()
```

```
html_class
```

Class used in the HTML.

Return str

```
html_classes = []
```

```
html_id
```

ID used in the HTML. Unique.

Return str

```
load_dashboard_entries (dashboard_entries=None)
```

Feed the dashboard entries to the layout for rendering later.

Parameters **dashboard_entries** (*iterable*) – Iterable of *dash.models.DashboardEntry* objects.

```
primary_html_class
```

```
render_for_edit ()
```

Renders the placeholder for edit mode.

Parameters

- **workspace** (*str*) – Current workspace slug.
- **request** (*django.http.HttpRequest*) –

Return str

```
render_for_view ()
```

Renders the placeholder for view mode.

Return str

```
rows = None
```

```
uid = None
```

```
view_template_name = ''
```

class `dash.base.BaseDashboardPlugin` (*layout_uid, placeholder_uid, workspace=None, user=None, position=None*)

Bases: `object`

Base dashboard plugin from which every plugin should inherit.

Properties

- *uid* (str): Plugin uid (obligatory). Example value: 'dummy', 'wysiwyg', 'news'.
- *name* (str): Plugin name (obligatory). Example value: 'Dummy plugin', 'WYSIWYG', 'Latest news'.
- *description* (str): Plugin decription (optional). Example value: 'Dummy plugin used just for testing'.
- ***help_text* (str): Plugin help text (optional). This text would be shown in**
`dash.views.add_dashboard_entry` and `dash.views.edit_dashboard_entry` views.
- *form*: Plugin form (optional). A subclass of `django.forms.Form`. Should be given in case plugin is configurable.
- *add_form_template* (str) (optional): Add form template (optional). If given, overrides the `dash.views.add_dashboard_entry` default template.
- *edit_form_template* (str): Edit form template (optional). If given, overrides the `dash.views.edit_dashboard_entry` default template.
- *html_classes* (list): List of extra HTML classes for the plugin.
- *group* (str): Plugin are grouped under the specified group. Override in your plugin if necessary.

add_form_template = None

delete_plugin_data ()

Used in `dash.views.delete_dashboard_entry`. Fired automatically, when `dash.models.DashboardEntry` object is about to be deleted. Make use of it if your plugin creates database records that are not monitored externally but by dash only.

description = None

edit_form_template = None

form = None

get_form ()

Get the plugin form class. Override this method in your subclassed `dash.base.DashboardPlugin` class when you need your plugin setup to vary depending on the placeholder, workspace, user or request given. By default returns the value of the `form` attribute defined in your plugin.

Return `django.forms.Form` or `django.forms.ModelForm` Subclass of `django.forms.Form` or `django.forms.ModelForm`.

get_initialised_create_form (*data=None, files=None*)

Used `dash.views.add_dashboard_entry` view to gets initialised form for object to be created.

get_initialised_create_form_or_404 (*data=None, files=None*)

Same as `get_initialised_create_form` but raises `django.http.Http404` on errors.

get_initialised_edit_form (*data=None, files=None, auto_id='id_%s', prefix=None, initial=None, error_class=<class 'django.forms.util.ErrorList'>, label_suffix=':', empty_permitted=False, instance=None*)

Used in `dash.views.edit_dashboard_entry` view.

get_initialised_edit_form_or_404 (*data=None, files=None, auto_id='id_%s', prefix=None, error_class=<class 'django.forms.util.ErrorList'>, label_suffix=':', empty_permitted=False*)

Same as `get_initialised_edit_form` but raises `django.http.Http404` on errors.

get_instance ()

get_plugin_form_data ()

Fed as `initial` argument to the plugin form when initialising the instance for adding or editing the plugin. Override in your plugin class if you need customisations.

get_position ()

Gets the exact position of the plugin widget in the placeholder (row number, col number).

Return tuple Tuple of row and col numbers.

get_widget (*request=None, as_instance=False*)

Gets the plugin widget.

Parameters

- **request** (*django.http.HttpRequest*) –
- **as_instance** (*bool*) –

Return mixed Subclass of `dash.base.BaseDashboardPluginWidget` or instance of subclassed `dash.base.BaseDashboardPluginWidget` object.

group = 'General'

help_text = None

html_class

A massive work on positioning the plugin and having it to be displayed in a given width is done here. We should be getting the plugin widget for the plugin given and based on its' properties (static!) as well as on plugin position (which we have from model), we can show the plugin with the exact class.

html_classes = []

html_id

load_plugin_data (*plugin_data*)

Loads the plugin data saved in `dash.models.DashboardEntry`. Plugin data is saved in JSON string.

Parameters **plugin_data** (*str*) – JSON string with plugin data.

name = None

post_processor ()

Redefine in your subclassed plugin when necessary.

Post process plugin data here (before rendering). This method is being called after the data has been loaded into the plugin.

Note, that request (`django.http.HttpRequest`) is available (`self.request`).

pre_processor ()

Redefine in your subclassed plugin when necessary.

Pre process plugin data (before rendering). This method is being called before the data has been loaded into the plugin.

Note, that request (`django.http.HttpRequest`) is available (`self.request`).

process (*plugin_data=None, fetch_related_data=False*)
 Init plugin with data.

process_plugin_data (*fetch_related_data=False*)
 Processes the plugin data.

render (*request=None*)
 Renders the plugin HTML (for dashboard workspace).

Parameters request (*django.http.HttpRequest*) –

Return str

uid = None

update_plugin_data (*dashboard_entry*)
 Used in `dash.management.commands.dash_update_plugin_data`.

Some plugins would contain data fetched from various sources (models, remote data). Since dashboard entries are by definition loaded extremely much, you are advised to store as much data as possible in `plugin_data` field of `dash.models.DashboardEntry`. Some externally fetched data becomes invalid after some time and needs updating. For that purpose, in case if your plugin needs that, redefine this method in your plugin. If you need your data to be periodically updated, add a cron-job which would run `dash_update_plugin_data` management command (see `dash.management.commands.dash_update_plugin_data` module).

Parameters dash.models.DashboardEntry – Instance of `dash.models.DashboardEntry`.

class `dash.base.BaseDashboardPluginWidget` (*plugin*)
 Bases: `object`

Base plugin widget.

So, if we would want to register a plugin widget (renderer) for some layout, we would first define the plugin widget and then just write:

```
>>> plugin_widget_registry.register(DummyPluginWidget)
```

Plugin widget is always being registered for a placeholder. Placeholder in its' turn has number of rows and columns. Since we register each widget for a (layout, placeholder, plugin) combination separately, it fits the needs and requirements perfectly. In that way we are able to tell, whether plugin has a widget available and actually valid (qua dimensions) for the placeholder. Plugin is just data. Nothing more. Widget operates with that data. Thus, widget has number of rows and columns it occupies in the placeholder registered. By default, number of rows and columns is set to 1, which means that a plugin occupies just 1 cell. But, certainly, there can be plugins that occupy more space in a placeholder.

```
cols = 1
html_class = ''
html_classes = []
layout_uid = None
media_css = []
media_js = []
placeholder_uid = None
plugin_uid = None
render (request=None)
```

rows = 1

`dash.base.get_registered_plugins()`

Gets a list of registered plugins in a form if tuple (plugin name, plugin description). If not yet autodiscovered, autodiscovers them.

Return list

`dash.base.get_registered_plugin_uids()`

Gets a list of registered plugin uids as a list. If not yet autodiscovered, autodiscovers them.

Return list

`dash.base.validate_plugin_uid(plugin_uid)`

Validates the plugin uid.

Parameters `plugin_uid (str)` –

Return bool

`dash.base.get_registered_layouts()`

Gets registered layouts.

`dash.base.get_registered_layout_uids()`

Gets uids of registered layouts.

`dash.base.get_layout(layout_uid=None, as_instance=False)`

Gets the layout by `layout_uid` given. If left empty, takes the default one chosen in settings.

Raises a `dash.exceptions.NoActiveLayoutChosen` when no default layout could be found.

Return `dash.base.BaseDashboardLayout` Subclass of `dash.base.BaseDashboardLayout`.

`dash.base.validate_placeholder_uid(layout, placeholder_uid)`

Validates the placeholder.

Parameters

- `layout_uid (str)` –
- `placeholder_uid (str)` –

Return bool

`dash.base.ensure_autodiscover()`

Ensures that plugins are autodiscovered.

class `dash.base.DashboardPluginFormBase`

Bases: object

Not a form actually. Defined for magic only.

Property iterable `plugin_data_fields` Fields to get when calling the `get_plugin_data` method.

Example

```
>>> plugin_data_fields = (
>>>     ('name', ''),
>>>     ('active': False)
>>> )
```

get_plugin_data()

Data that would be saved in the `plugin_data` field of the `dash.models.DashboardEntry` subclassed model.

`plugin_data_fields = None`

save_plugin_data ()
 Dummy, but necessary.

`dash.base.collect_widget_media (dashboard_entries)`
 Collects the widget media for dashboard entries given.

Parameters `dashboard_entries` (*iterable*) – Iterable of `dash.models.DashboardEntry` instances.

Return dict Returns a dict containing the ‘js’ and ‘css’ keys. Correspondent values of those keys are lists containing paths to the CSS and JS media files.

18.1.5 dash.conf module

`dash.conf.get_setting (setting, override=None)`
 Get a setting from `dash` conf module, falling back to the default.

If `override` is not `None`, it will be used instead of the setting.

Parameters

- **setting** – String with setting name
- **override** – Value to use when no setting is available. Defaults to `None`.

Returns Setting value.

18.1.6 dash.decorators module

`dash.decorators.permissions_required (perms, satisfy='all', login_url=None, raise_exception=False)`
 Checks for the permissions given based on the strategy chosen.

Parameters

- **perms** (*iterable*) –
- **satisfy** (*str*) – Allowed values are “all” and “any”.
- **login_url** (*str*) –
- **raise_exception** (*bool*) – If set to `True`, the `PermissionDenied` exception is raised on failures.

Return bool

Example

```
>>> @login_required
>>> @permissions_required(satisfy='any', perms=[
>>>     'dash.add_dashboardentry', 'dash.change_dashboardentry', 'dash.delete_dashboardentry',
>>>     'dash.add_dashboardworkspace', 'dash.change_dashboardworkspace', 'dash.delete_dashboardw
>>>     'dash.add_dashboardsettings', 'dash.change_dashboardsettings', 'dash.delete_dashboardset
>>> ])
>>> def edit_dashboard(request):
>>>     # your code
```

`dash.decorators.all_permissions_required (perms, login_url=None, raise_exception=False)`

Example

```
>>> @login_required
>>> @all_permissions_required([
>>>     'dash.add_dashboardentry', 'dash.change_dashboardentry', 'dash.delete_dashboardentry',
>>>     'dash.add_dashboardworkspace', 'dash.change_dashboardworkspace', 'dash.delete_dashboardw
>>>     'dash.add_dashboardsettings', 'dash.change_dashboardsettings', 'dash.delete_dashboardset
>>> ])
>>> def edit_dashboard(request):
>>>     # your code
```

`dash.decorators.any_permission_required` (*perms*, *login_url=None*, *raise_exception=False*)

Example

```
>>> @login_required
>>> @any_permission_required([
>>>     'dash.add_dashboardentry', 'dash.change_dashboardentry', 'dash.delete_dashboardentry',
>>>     'dash.add_dashboardworkspace', 'dash.change_dashboardworkspace', 'dash.delete_dashboardw
>>>     'dash.add_dashboardsettings', 'dash.change_dashboardsettings', 'dash.delete_dashboardset
>>> ])
>>> def edit_dashboard(request):
>>>     # your code
```

`dash.decorators.edit_dashboard_permission_required` (*login_url=None*,
raise_exception=False)

Checks if user has permissions to edit dashboard. Simply, check is successful if any of the following permission checks are satisfied:

- Can add dashboard entry
- Can change dashboard entry
- Can delete dashboard entry
- Can add dashboard workspace
- Can change dashboard workspace
- Can delete dashboard workspace
- Can add dashboard settings
- Can change dashboard settings
- Can delete dashboard settings

Example

```
>>> @login_required
>>> @edit_dashboard_permission_required() # Do not forget the brackets!
>>> def edit_dashboard(request):
>>>     # your code
```

18.1.7 dash.defaults module

18.1.8 dash.discover module

`dash.discover.autodiscover` ()
Autodiscovers files that should be found by dash.

18.1.9 dash.exceptions module

exception `dash.exceptions.InvalidRegistryItemType`

Bases: `exceptions.ValueError`

Raised when an attempt is made to register an item in the registry which does not have a proper type.

exception `dash.exceptions.LayoutDoesNotExist`

Bases: `exceptions.Exception`

Raised when layout does not exist.

exception `dash.exceptions.PluginWidgetOutOfPlaceholderBoundaries`

Bases: `exceptions.Exception`

Raised when plugin widget is out of placeholder boundaries.

18.1.10 dash.fields module

```
class dash.fields.OrderField(verbose_name=None, name=None, primary_key=False,
                             max_length=None, unique=False, blank=False,
                             null=False, db_index=False, rel=None, default=<class
                             django.db.models.fields.NOT_PROVIDED at 0x214c598>,
                             editable=True, serialize=True, unique_for_date=None,
                             unique_for_month=None, unique_for_year=None, choices=None,
                             help_text=u'', db_column=None, db_tablespace=None,
                             auto_created=False, validators=[ ], error_messages=None)
```

Bases: `django.db.models.fields.IntegerField`

@author <http://djangosnippets.org/users/zenx/> @source <http://djangosnippets.org/snippets/1861/>

OrderField for models from <http://ianonpython.blogspot.com/2008/08/orderfield-for-django-models.html> and updated to use a django aggregation function. This field sets a default value as an auto-increment of the maximum value of the field +1.

Ignores the incoming value and instead gets the maximum plus one of the field.

This works really well in combination with “sortable_list.js”. There are several things you should know:

- order field shall be `null=True`, `blank=True`
- order field shall not be unique

If above mentioned is True, you can use jQuery drag-n-drop widget in your Django-admin. See the following example:

```
class Media: # This belongs to your Admin class (admin.ModelAdmin)
    js = [ '/media/js/jquery-1.6.2.min.js', '/media/js/jquery-ui-1.8.16.custom.min.js', '/me-
          dia/js/sortable_list.js'
          ]
    formfield_(**kwargs)
    pre_save(model_instance, value)
```

18.1.11 dash.forms module

class `dash.forms.DashboardWorkspaceForm` (**args*, ***kwargs*)

Bases: `django.forms.models.ModelForm`

Dashboard workspace form.

class `Meta`

exclude = ('position', 'layout_uid')

model

alias of `DashboardWorkspace`

`DashboardWorkspaceForm.base_fields` = {'user': <django.forms.models.ModelChoiceField object at 0x32cd150>

`DashboardWorkspaceForm.declared_fields` = {}

`DashboardWorkspaceForm.media`

18.1.12 dash.helpers module

`dash.helpers.slugify_workspace` (*s*)

`dash.helpers.lists_overlap` (*sub*, *main*)

18.1.13 dash.models module

class `dash.models.DashboardSettings` (**args*, ***kwargs*)

Bases: `django.db.models.base.Model`

Dashboard settings.

Properties

- *user* (`django.contrib.auth.models.User`): User owning the plugin.
- *layout_uid* (str): Users' preferred layout.
- *title* (str): Dashboard title.
- *is_public* (bool): If set to True, available as public (read-only mode).

exception `DoesNotExist`

Bases: `django.core.exceptions.ObjectDoesNotExist`

exception `DashboardSettings.MultipleObjectsReturned`

Bases: `django.core.exceptions.MultipleObjectsReturned`

`DashboardSettings.objects` = <django.db.models.manager.Manager object at 0x243e990>

`DashboardSettings.user`

class `dash.models.DashboardWorkspace` (**args*, ***kwargs*)

Bases: `django.db.models.base.Model`

Dashboard workspace.

Properties

- *user* (`django.contrib.auth.models.User`): User owning the plugin.
- *layout_uid* (str): Layout to which the entry belongs to.

- *name* (str): Dashboard name.
- *slug* (str): Dashboard slug.
- *position* (int): Dashboard position.

exception DoesNotExist

Bases: `django.core.exceptions.ObjectDoesNotExist`

exception DashboardWorkspace.MultipleObjectsReturned

Bases: `django.core.exceptions.MultipleObjectsReturned`

DashboardWorkspace.**dashboardentry_set**

DashboardWorkspace.**get_absolute_url** (**moreargs*, ***morekwargs*)

Absolute URL, which goes to the dashboard workspace page.

Return str

DashboardWorkspace.**get_entries** (*user*)

Gets all dashboard entries for user given.

Parameters *user* (`django.contrib.auth.models.User`) –

Return iterable

DashboardWorkspace.**objects** = `<django.db.models.manager.Manager object at 0x2494390>`

DashboardWorkspace.**user**

class `dash.models.DashboardEntry` (**args*, ***kwargs*)

Bases: `django.db.models.base.Model`

Dashboard entry (widget).

Since workspace can be nullable (default), we duplicate the *layout_uid*.

Properties

- *user* (`django.contrib.auth.models.User`): User owning the plugin.
- *workspace* (`dash.models.DashboardWorkspace`): Workspace to which the plugin belongs to. If left blank, entry belongs to default workspace.
- *layout_uid* (str): Layout to which the entry belongs to.
- *placeholder_uid* (str): Placeholder to which the entry belongs to.
- *plugin_uid* (str): Plugin name.
- *plugin_data* (str): JSON formatted string with plugin data.
- *position* (int): Entry position.

exception DoesNotExist

Bases: `django.core.exceptions.ObjectDoesNotExist`

exception DashboardEntry.MultipleObjectsReturned

Bases: `django.core.exceptions.MultipleObjectsReturned`

DashboardEntry.**get_plugin** (*fetch_related_data=False*, *request=None*)

Gets the plugin class (by *plugin_name* property), makes an instance of it, serves the data stored in *plugin_data* field (if available). Once all is done, plugin is ready to be rendered.

Parameters *fetch_related_data* (*bool*) – When set to True, plugin is told to re-fetch all related data (stored in models or other sources).

Return `dash.base.DashboardPlugin` Subclass of `dash.base.DashboardPlugin`.

`DashboardEntry.objects = <dash.models.DashboardEntryManager object at 0x2494a50>`

`DashboardEntry.plugin_uid_code ()`
Mainly used in admin.

`DashboardEntry.user`

`DashboardEntry.workspace`

class `dash.models.DashboardPlugin (*args, **kwargs)`

Bases: `django.db.models.base.Model`

Dashboard plugin. Used when `dash.settings.RESTRICT_PLUGIN_ACCESS` is set to `True`.

Properties

- `plugin_uid` (str): Plugin UID.
- `users` (`django.contrib.auth.models.User`): White list of the users allowed to use the dashboard plugin.
- `groups` (`django.contrib.auth.models.Group`): White list of the user groups allowed to use the dashboard plugin.

exception `DoesNotExist`

Bases: `django.core.exceptions.ObjectDoesNotExist`

exception `DashboardPlugin.MultipleObjectsReturned`

Bases: `django.core.exceptions.MultipleObjectsReturned`

`DashboardPlugin.groups`

`DashboardPlugin.groups_list ()`

Flat list (comma separated string) of groups allowed to use the dashboard plugin. Used in Django admin.

Return str

`DashboardPlugin.objects = <dash.models.DashboardPluginManager object at 0x24974d0>`

`DashboardPlugin.plugin_uid_admin ()`
Mainly used in admin.

`DashboardPlugin.plugin_uid_code ()`
Mainly used in admin.

`DashboardPlugin.users`

`DashboardPlugin.users_list ()`

Flat list (comma separated string) of users allowed to use the dashboard plugin. Used in Django admin.

Return str

18.1.14 dash.settings module

- `RESTRICT_PLUGIN_ACCESS` (bool): If set to `True`, (Django) permission system for dash plugins is enabled.
- `PLUGINS_MODULE_NAME` (str): Name of the module to placed in the (external) apps in which the dash plugin code should be implemented and registered.
- `ACTIVE_LAYOUT` (str): Active layout UID.
- `LAYOUTS_MODULE_NAME` (str): Name of the python module to be placed in (external) apps in which the dash layouts should be implemented and registered.
- `DEFAULT_WORKSPACE_NAME` (str): Name of the default workspace.

- `DEFAULT_PLACEHOLDER_VIEW_TEMPLATE_NAME` (str): Default template name for the placeholder view.
- `DEFAULT_PLACEHOLDER_EDIT_TEMPLATE_NAME` (str): Default template name for the placeholder edit.
- `LAYOUT_CELL_UNITS` (str): Layout cell units. Allowed values are *em*, *px*, *pt*, *%*.
- `DISPLAY_AUTH_LINK` (bool): If set to True, the log in or log out link is shown in the Dash drop-down menu.
- `DEBUG`

18.1.15 dash.tests module

```
class dash.tests.DashBrowserTest (methodName='runTest')
    Bases: django.test.testcases.LiveServerTestCase
    django-dash browser tests.
    TODO: At the moment is done for admin only. Normal users shall be tested as well for plugin security workflow
    (permissions system used).
    LIVE_SERVER_URL = None
    e = AttributeError("‘module’ object has no attribute ‘LIVE_SERVER_URL’",)
    classmethod setUpClass ()
    classmethod tearDownClass ()
    test_01_add_dashboard_entry (*args, **kwargs)
    test_02_edit_dashboard_entry (*args, **kwargs)
    test_03_delete_dashboard_entry (*args, **kwargs)
class dash.tests.DashCoreTest (methodName='runTest')
    Bases: django.test.testcases.TestCase
    Tests of django-dash core functionality.
    setUp ()
    test_01_registered_layouts (*args, **kwargs)
    test_02_active_layout (*args, **kwargs)
    test_03_get_layout_placeholders (*args, **kwargs)
    test_04_active_layout_render_for_view (*args, **kwargs)
    test_05_get_occupied_cells (*args, **kwargs)
dash.tests.create_dashboard_user ()
    Create a user for testing the dashboard.
    TODO: At the moment an admin account is being tested. Automated tests with diverse accounts are to be
    implemented.
dash.tests.print_info (func)
    Prints some useful info.
dash.tests.setup_dash ()
    Set up dash.
```

18.1.16 dash.urls module

18.1.17 dash.utils module

`dash.utils.get_allowed_plugin_uids (user)`

Gets allowed plugins uids for user given.

Parameters `import User (django.contrib.auth.models)` –

Return list

`dash.utils.get_user_plugins (user)`

Gets a list of user plugins in a form if tuple (plugin name, plugin description). If not yet autodiscovered, autodiscovers them.

Return list

`dash.utils.get_user_plugin_uids ()`

Gets a list of user plugin uids as a list . If not yet autodiscovered, autodiscovers them.

Return list

`dash.utils.get_widgets (layout, placeholder, user=None, workspace=None, position=None, occupied_cells=[])`

Gets widgets. In case if in restricted mode (`RESTRICT_PLUGIN_ACCESS` is set to `True`), user argument should be provided. Based on it, the list of plugins is returned. Restrictions are bypassed in case if `RESTRICT_PLUGIN_ACCESS` is set to `False` or user given is a superuser.

Placeholders are validated already. We don't need to have validation here.

Parameters

- **layout** (*dash.base.BaseDashLayout*) – Layout object.
- **placeholder_uid** (*str*) – Placeholder uid.
- **user** (*django.contrib.auth.models.User*) –
- **workspace** (*str*) – Workspace slug.
- **position** (*int*) – Plugin position.
- **occupied_cells** (*list*) – List of already occupied cells.

Return list

`dash.utils.update_plugin_data ()`

Updates the plugin data for all dashboard entries of all users. Rules for update are specified in the plugin itself.

`dash.utils.sync_plugins ()`

Syncs the registered plugin list with data in `dash.models.DashboardPlugin`.

`dash.utils.get_workspaces (user, layout_uid=None, workspace=None, public=False)`

Gets previous, current, next and and a queryset of all workspaces.

Parameters

- **workspace** (*str*) –
- **django.contrib.auth.models.User** –

Return dict

`dash.utils.build_cells_matrix (user, layout, placeholder, workspace=None)`

Builds the cells matrix.

Parameters

- **user** (*django.contrib.auth.models.User*) –
- **placeholder_uid** (*str*) –
- **workspace** (*str*) – Workspace slug.

Return list List of cells occupied.

`dash.utils.get_or_create_dashboard_settings` (*user*)

Gets dashboard settings for the user given. If no settings found, creates default settings.

Parameters `django.contrib.auth.models.User` –

Return `dash.models.DashboardSettings` Returns `dash.models.DashboardSettings` instance.

`dash.utils.get_dashboard_settings` (*username*)

Gets dashboard settings for the user given. If no settings found, creates default settings.

Parameters `username` (*str*) –

Return `dash.models.DashboardSettings` Returns `dash.models.DashboardSettings` instance.

`dash.utils.get_public_dashboard_url` (*dashboard_settings*)

Gets resolved public dashboard URL (if public dashboard app is installed == present in the global urls module of the project).

Parameters `dash.models.DashboardSettings` – Instance of `dash.models.DashboardSettings`.

Return `str`

18.1.18 dash.views module

`dash.views.add_dashboard_entry` (*request, *args, **kwargs*)

Add dashboard entry.

Parameters

- **request** (*django.http.HttpRequest*) –
- **placeholder_uid** (*str*) – Placeholder UID.
- **plugin_uid** (*str*) – Plugin UID.
- **workspace** (*str*) – Workspace slug.
- **position** (*int*) – If given, provided as position for the plugin (conflict resolution should take place).
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX requests.

Return `django.http.HttpResponse`

`dash.views.create_dashboard_workspace` (*request, *args, **kwargs*)

Create dashboard workspace.

Parameters

- **request** (*django.http.HttpRequest*) –
- **template_name** (*str*) –

- **template_name_ajax** (*str*) – Template used for AJAX calls.

Return `django.http.HttpResponse`

`dash.views.dashboard` (*request*, **args*, ***kwargs*)
Dashboard.

Parameters

- **request** (*django.http.HttpRequest*) –
- **workspace** (*str*) – Workspace slug. If given, the workspace loaded. Otherwise we deal with no workspace.

Return `django.http.HttpResponse`

`dash.views.dashboard_workspaces` (*request*, **args*, ***kwargs*)
Workspaces list.

Parameters

- **request** (*django.http.HttpRequest*) –
- **workspace** (*str*) – Workspace slug.
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX requests.

Return `django.http.HttpResponse`

`dash.views.delete_dashboard_entry` (*request*, **args*, ***kwargs*)
Remove dashboard entry.

Parameters

- **request** (*django.http.HttpRequest*) –
- **id** (*int*) – ID of the dashboard entry to delete.

Return `django.http.HttpResponse`

`dash.views.delete_dashboard_workspace` (*request*, **args*, ***kwargs*)
Delete dashboard workspace.

Parameters

- **request** (*django.http.HttpRequest*) –
- **id** (*int*) – DashboardWorkspace id.
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX calls.

Return `django.http.HttpResponse`

`dash.views.edit_dashboard` (*request*, **args*, ***kwargs*)
Edit dashboard.

Parameters

- **request** (*django.http.HttpRequest*) –
- **workspace** (*str*) – Workspace slug. If given, the workspace loaded. Otherwise we deal with no workspace.

Return `django.http.HttpResponse`

`dash.views.edit_dashboard_entry` (*request*, *args, **kwargs)

Edit dashboard entry.

Parameters

- **request** (*django.http.HttpRequest*) –
- **id** (*int*) – ID of the dashboard entry to edit.
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX requests.

Return `django.http.HttpResponse`

`dash.views.edit_dashboard_settings` (*request*, *args, **kwargs)

Edit dashboard settings.

Parameters

- **request** (*django.http.HttpRequest*) –
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX calls.

Return `django.http.HttpResponse`

`dash.views.edit_dashboard_workspace` (*request*, *args, **kwargs)

Edit dashboard workspace.

Parameters

- **request** (*django.http.HttpRequest*) –
- **id** (*int*) – DashboardWorkspace ID.
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX calls.

Return `django.http.HttpResponse`

`dash.views.plugin_widgets` (*request*, *args, **kwargs)

Plugin widgets view. Lists all the widgets for the placeholder and workspace given.

Parameters

- **request** (*django.http.HttpRequest*) –
- **placeholder_uid** (*str*) – Placeholder UID.
- **position** (*int*) – Position on the dashboard to which the widget is to be added.
- **template_name** (*str*) –
- **template_name_ajax** (*str*) – Template used for AJAX requests.

Return `django.http.HttpResponse`

18.1.19 dash.widgets module

class `dash.widgets.BooleanRadioSelect` (*args, **kwargs)

Bases: `django.forms.widgets.RadioSelect`

Boolean radio select for Django.

Example

```
>>> class DummyForm(forms.Form):
>>>     agree = forms.BooleanField(label=_("Agree?"), required=False, widget=BooleanRadioSelect)

media
```
