Plugin documentation

1.1 Last change

New instructions to apply changes from immediatly previous version.

- **0.4.0b1** [(12-10-2015) Compatibily library][OpenZwave >= 1.3.401, python_openzwave >= 0.3.0 (b4)]
 - Target: python-openzwave, domogik (0.4.1)
 - Update, compile and install python_openzwave.
 - Change log:
 - * New version for domogik 0.4.1
- · Previous change

1.2 Purpose

Z-Wave is a wireless ecosystem that lets all your home electronics talk to each other, and to you, via remote control. This plugin allows to control zwave devices.

It uses open source library openZwave c++ project and python-openzwave as interfacing cython, The Zwave network manager is directly integrated into the plugin

Simple action/sensor of devices have access via domogik devices (widgets). Viewing and setting Zwave devices is accessed via a special plugin page from the admin panel.

Development is in progress, features will get gradually

1.3 Dependencies

- Python-openzwave (>=0.3.5)
- tailer 0.3 library for Python (>=0.2.1)

1.4 Controller/devices Compatibility List

Following interfaces are supported and verify with domogik:

- Aeon Labs Z-Stick Series 2
- RaZberry (using rule with /dev/ttyAMA0 instead of /dev/ttyUSBx)

Others controllers are supported by openzwave, you can check here

Following devices are supported:

- Everspring
 - ST814 Temperature, Humidity Sensor
 - AN158 Switch Meter Plugin
 - SE812 Siren
- Everspring (C.T.)
 - HSM02 Door windows sensor
- Fibaro
 - FGS211 Relay Switch 3KW
 - FGS221 Double Relay Switch 2x1,5kW
 - FGD211 Universal Dimmer 500W
 - WallPlug Meter Switch with leds
- · Aeon Labs
 - HEM Home Energy Metter
 - DSB05 Motion Multi Sensor,
- Express Controls
 - HSM100 EZMotion luminosity and temperature sensor
- Danfoss
 - Living connect (thermost heating)

1.5 Create the udev rule for controller

You may create a udev rule for this device. The rule and filename are given in the **Requirements** tab of the plugin configuration page.

Currently, your PC controller is known as /dev/ttyUSBx (by default). This is not very convenient nor meaningful. We will then create a new udev rule that will create a link called /dev/zwave that will point to /dev/ttyUSBx.

1.5.1 Gather information about your device controller (USB)

- Example using Aeon Stick2 on USB port. For ohter model it's should different.
- Use **Isusb** command for listing of USB devices, check before and after plug your USB controller.

```
$ lsusb
Bus 001 Device 001: ID 1d6b:0002 Linux Foundation 2.0 root hub
Bus 002 Device 001: ID 1d6b:0002 Linux Foundation 2.0 root hub
Bus 003 Device 001: ID 1d6b:0002 Linux Foundation 2.0 root hub
Bus 004 Device 001: ID 1d6b:0001 Linux Foundation 1.1 root hub
Bus 005 Device 001: ID 1d6b:0001 Linux Foundation 1.1 root hub
Bus 006 Device 001: ID 1d6b:0001 Linux Foundation 1.1 root hub
Bus 007 Device 001: ID 1d6b:0001 Linux Foundation 1.1 root hub

Bus 004 Device 006: ID 0403:6001 Future Technology Devices International, Ltd FT232 USB-Serial (UART Bus 007 Device 002: ID 0b05:179c ASUSTEK Computer, Inc.
```

- Use ls /dev/ttyUSB* to check your num USB, check before and after plug your USB controller.
- · Before

```
$ ls /dev/ttyUSB*
/dev/ttyUSB2
```

• After USB plug

```
$ ls /dev/ttyUSB*
/dev/ttyUSB0 /dev/ttyUSB2
```

• Use **udevadm** command to gather information about your device :

```
$ udevadm info -a -n /dev/ttyUSB0
Udevadm info starts with the device specified by the devpath and then
walks up the chain of parent devices. It prints for every device
found, all possible attributes in the udev rules key format.
A rule to match, can be composed by the attributes of the device
and the attributes from one single parent device.
  looking at device '/devices/pci0000:00/0000:00:12.0/usb4/4-3/4-3:1.0/ttyUSB0/tty/ttyU$B0':

 ATTRS{msi_bus}==""
looking at parent device '/devices/pci0000:00':
 KERNELS=="pci0000:00"
  SUBSYSTEMS==""
  DRIVERS==""
```

Those information will be useful to determinate for sure that this device is your Zwave controller. We will use several information, flagged above as **DRIVERS ATTRS{manufacturer}** and **ATTRS{product}** With that, we will be sure that we'll be talking to our controller. You can chose others attributs.

1.5.2 Create rule.

- Create a new file, in folder etc/udev/rules.d Let's call it 98-usbcp210x.rules
- Enter those information in the file:

```
# for z-Stick serie 2 to domogik /dev/zwave
DRIVERS=="usb", ATTRS{manufacturer}=="Silicon Labs", ATTRS{product}=="CP2102 USB to UART Bridge Cont:
```

The **DRIVERS ATTRS**{**manufacturer**} **ATTRS**{**product**} values must be coherent with what you have found above. * Ask udev to rediscover your device :

```
# udevadm test $(udevadm info --query path --name ttyUSB0)
```

• Your device should now be re-discovered, let's confirm it :

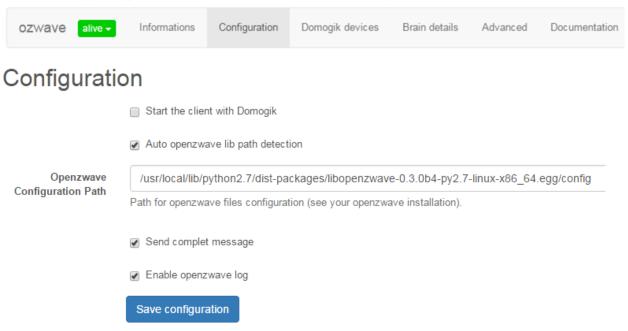

```
$ 1s -1 /dev/zwave
lrwxrwxrwx 1 root root 7 2012-08-27 00:46 /dev/zwave -> ttyUSB0
```

1.6 Plugin configuration

1.6.1 Configuration

In Domogik administration section, go to client plugin-ozwave details page.

Client plugin-ozwave.vmdomogik0

1.6.2 Creating devices for ozwave

In clients page of admin UI, go to **plugin-ozwave-<your_host_domogik>**, select tab **Devices**, **New** to create your devices.

Client plugin-ozwave.vmdomogik0

Create a device for the primary zwave controller

Chose instance-type: primary.controller named **Zwave Controler**.

Or all other device type who are a controller (Z-Stick2)

Create a new device Create by device type Dimmer button Sensor security alarm (battery) Sensor security alarm (battery) Dimmer buttons (battery) Zwave Controller Power meter (battery) Sensor motion 4in1 (battery) Node Opening sensor (battery) Power meter Temperature sensor (battery) Simple Switch Switch-Power meter Switch-Power meter + Temperature/humidity sensor Temperature/humidity/relative sensor Temperature/humidity/relative sensor (battery) Temperature sensor Temperature sensor (battery)

That device create a link between the driver and openzwave, also between the zwave homeId and your networkId used by domogik for devices addresse. You can create it after starting the plugin, so it is possible to find its address in the devices table of the **controller and devices** You can create as many **Zwave Controller** you have primary controllers.

Note:

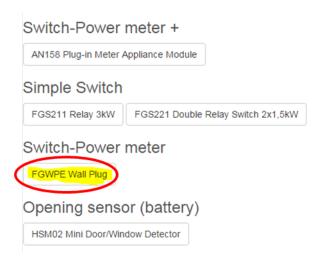

- Create this device is necessary to handle your zwave network.
- Main parameters

Key	Example	Description
Device Name	MyController The display name for this device.	
Description	What you want A short descriptionn for this device.	
Reference	Z-Stick 2	A reference for this device, eg.: manufacturer reference.

· Global parameters

Key	Example	Description
driver	/dev/zwave	Z-wave device that you have define in UDEV rule
networkid	MyHomeNetwork	Home ID name for association with domogik devices

Feature example

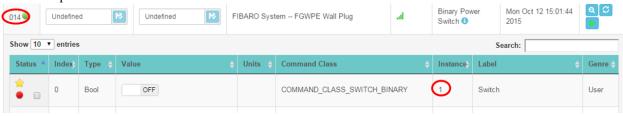

• Main parameters

Key	Example	Description	
Device Name	MyController The display name for this device.		
Description	What you want A short description for this device.		
Reference	FGWPE Wall Plug	A reference for this device, eg.: manufacturer reference.	

• Global parameters (Extra parameters for some particular zwave device)

Key	Example	Description
batterycheck	True	HCheck battery level at zwave device wakeup.

Key	Example	Description
networkid	MyHomeNetwork	Home ID name for association with domogik devices
node	14	Z-wave node id that you can find in the nodes table

• xPL command parameters (if it's a zwave device with command(s))

Key	Example	Description
<pre><xpl_cmds> - instance</xpl_cmds></pre>	1	Zwave node instance id that you can find in the Commands Class table

• xPL stat parameters (if it's a zwave device with sensor(s))

Key	Example	Description
<pre><xpl_stat> - instance</xpl_stat></pre>	1	Zwave node instance id that you can find in the Commands Class table

1.6.3 Start the plugin

You can now start the plugin (start button) and use the created devices.

1.6.4 Configure the features widgets on Domoweb

You can now place the widgets of your devices features on Domoweb.

Dependencies installation

2.1 Install the tailer library for Python

• tailer 0.3 library for Python

Install **tailer**:

\$ sudo pip install tailer

2.2 Install python-openzwave

2.2.1 Purpose

This not a plugin, but an external library for zwave plugin, is based on python-openzwave software.

python-openzawe and openzawe are in high development, by two different teams, so installing it can be sometimes not so easy. So we propose you different methods to install it.

For the operation of ozwave domogik plugin there is only need part python-openzwave Lib.

Of course you can install part python-openzwave API

Get information from bibi21000 home site form more python-openzwave details.

All information are extracted from the git repository https://github.com/OpenZWave/python-openzwave

2.2.2 Installing python-openzwave from archive

This is the simplest (and the fastest) way to install python- openzwave. It cames with openzwave source files and is already cythonized.

This is surely the best soltion to install python-openzwave on a raspberry pi.

Get archive of python-openzwave

You are now ready to download sources of python-openzwave here:

http://bibi21000.no-ip.biz/python-openzwave/

This archive contains sources of python-openzwave and openzwave.

```
tar xvzf python-openzwave-X.Y.Z.tar.gz
```

This command will extract all the needed sources. And change to the right directory.

```
cd python-openzwave-X.Y.Z
```

Install the needed tools

You must install git and other tools to get sources of python- openzwave and openzwave and build them. Look at the documentation of your Linux distribution to do that.

On a debian like distribution:

sudo make deps

Build process

Now, you can compile sources:

```
make build
```

If you have already built python-openzwave or the build failed you can use the clean option:

```
sudo make clean
make build
```

Do not use root to build python-openzwave as it will surely fails. Please use a "normal user".

Installation

You can now install the packages using the following command will.

```
sudo make install
```

The installation script create a list of installed files. So you can remove python-openzwave using the following command:

sudo make uninstall

If it fails

Simply remove the python-openzwave-x.y.z directory and extract it again.

2.2.3 Installing python-openzwave from repository

Install the needed tools

You must install git and make to retrieve sources of python-openzwave and openzwave.

On a debian like distribution:

```
sudo apt-get install -y git make
```

Get sources of python-openzwave

You are now ready to download sources of python-openzwave:

git clone https://github.com/OpenZWave/python-openzwave

The previous command will create a copy of the official repository on your computer in a directory called pythonopenzwave.

Install dependencies

You need some tools (a c++ compiler, headers dir python, ...) to build python-openzwave and openzwave library.

On a debian like distribution:

sudo make repo-deps

For non-debian (fedora, ...), you can retrieve the packages needed in the Makefile.

Update and build process

Go to the previously created directory

cd python-openzwave

The following command will update your local repository to the last release of python-openzwave and openzwave.

make update

When update process is done, you can compile sources

make build

Or if you have already build python-openzwave in a previous installation, you can use the clean target to remove old builds.

sudo make clean

Do not use root to build python-openzwave as it will surely fails. Please use a "normal user".

Installation

You can now ready to install the eggs using the following command:

sudo make install

You can also remove python-openzwave using:

sudo make uninstall

Running tests

You can launch the regression tests using:

make tests

Keep in mind that the tests will "play" with your nodes: switching on and off, dimming, adding and removing scenes,

2.2.4 Static vs dynamic (or shared)

The openzwave (c++) lib needs to run as a singleton: it means that it MUST have only one instance of the manager running on your computer.

There is 2 ways of linking libraries with a program:

static: includes a copy of the library in your binary program. This means

that your program has its own instance of the library. This the way the install.sh runs. So you CAN'T have another program (like the control-panel) running when using the python-openzwave library

dynamic or shared: includes a link to the library in your binary program.

This means that your program share the library with other programs. In this case, the instance is owned directly by the library. This the way the debian package works. So you CAN have another program running when using the python-openzwave library. Of course, this program MUST use the shared library.

2.2.5 Creating the zwave device controller

We need to create an udev rule in order to create the device /dev/zwave - check your device It's suppose your zwave controller is at /dev/ttyUSB0

```
$ udevadm info --name=/dev/ttyUSB0 --attribute-walk
```

• locate your idVendor and idProdroduct

In /etc/udev/rules.d, create a file zwave.rules, and write the following rule

Example, for aeon stick

```
| SUBSYSTEMS=="usb", ATTRS{idVendor}=="10c4", ATTRS{idProduct}=="ea60", SYMLINK+="zwave", MODE="0666"
```

2.2.6 Other zwave tool

Migrating from python-openzwave 0.2.X to 0.3.0

I need to update source tree of python-openzwave and modules's names because of a bug in setuptools : https://bitbucket.org/pypa/setuptools/issue/230/develop-mode-does-not-respect-src . Sorry for that.

Update your sources:

```
git pull
```

Before building python-openzwave 0.3.0, you must uninstall the old version :

```
sudo make uninstall
```

About cython: I've made many tests using cython installed via pip: (0.20, 0.21 and 0.22). Compilation is ok but a segfault appears when launching the tests. Please remove it.

```
sudo pip uninstall Cython
```

You also need to make some minor updates in you code, look at CHANGELOG

If you have problems, please submit an issue with:

• cython -V

- the content of the directory /usr/local/lib/python2.7/dist-packages/ (for python2.7)
- the content of /usr/local/lib/python2.7/dist-packages/easy-install.pth (for python 2.7)

Ubuntu 64bits ... and the others

If you're using Ubuntu 64 bits (and mayde others) and keep your distribution up to date, you certainly have the segfault problem.

It appears with the last update of python:

```
$ python
Python 2.7.6 (default, Jun 22 2015, 17:58:13)
[GCC 4.8.2] on linux2
Type "help", "copyright", "credits" or "license" for more information.
```

I've open a discussion on cython-users here: https://groups.google.com/forum/#!topic/cython-users/mRsviGuCFOk

The only way I found to avoid this is to rebuild and reinstall the old release of python:

```
wget https://launchpad.net/ubuntu/+archive/primary/+files/python2.7_2.7.6-8.dsc https://launchpa
```

Wait, wait and await again:)

```
cd ..
sudo dpkg -i *.deb
```

To prevent future updates of python, you could mark its packages. For example, if you use apt to update your distribution, use the following command:

```
sudo apt-mark hold idle-python2.7 libpython2.7-minimal python2.7-dbg python2.7-minimal libpython2.7
```

Some users have reported that building python-openzwave using the archive (INSTALL_ARCH) can also do the trick. Let me know if it works for you.

Openzwave control-panel

In order to identify your network and collect the NodeID of your devices, you can use the openzwave-control-panel

2.2.7 Developer resources

For developing you can access to python-openzwave dev, instructions here:

http://bibi21000.gallet.info/index.php/en/component/sphinxdoc/documentation/4-python-openzwave-lib.html http://bibi21000.gallet.info/index.php/en/component/sphinxdoc/documentation/3-python-openzwave-api.html

Openzwave & Manager tools

3.1 State and version of libraries

Client plugin-ozwave.vmdomogik0

The two flag Openzwave and Manager give the state of respective library

• Red : Stopped

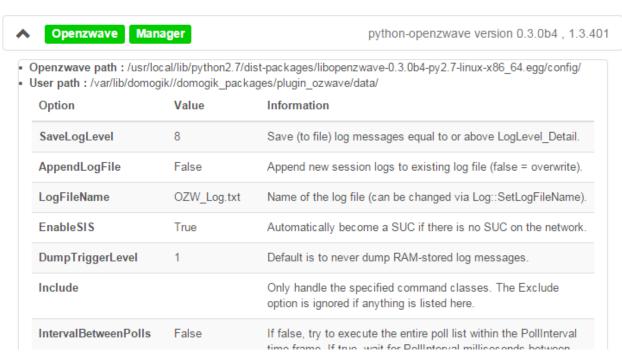

* Grey: Unknown * Black: Failed

Openzwave: is the openzwave librarie installed. Manager: is the ozwave plugin manager connected to openzwave.

On right python-openzwave and openzwave libraries version are display, only if the plugin is started.

This row can be collaspe to display openzwave configuration options.

3.2 Openzwave configuration options

Here you can check all options. All details are commented in table.

Soon in a future release, it may be possible to edit them..

3.3 Controller and Network tab

Under state libraries row, a tab list and display all controller knowns.

Debug tools

Zwave Controller administration

In progress - Devices initializing

Controller & devices tools

4.1 Get Zwave controller informations

· you can check to verify the information on zwave network state and controller in the first part of the page.

The status information can be refreshed using button.

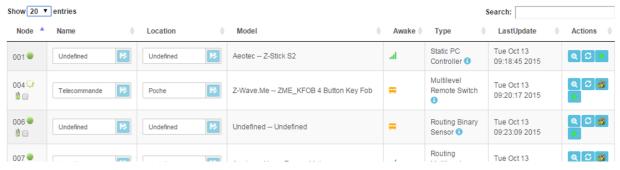

4.2 Get Zwave devices (Nodes) informations

Note: On a zwave system, devices are called **Nodes**.

• Devices initialisation field give state of global initialize process.

The process can take a long time (up to 5 min). Be patient..... All nodes discovered and / or stored are scanned one by one to be initialized.

The status information can be refreshed using button.

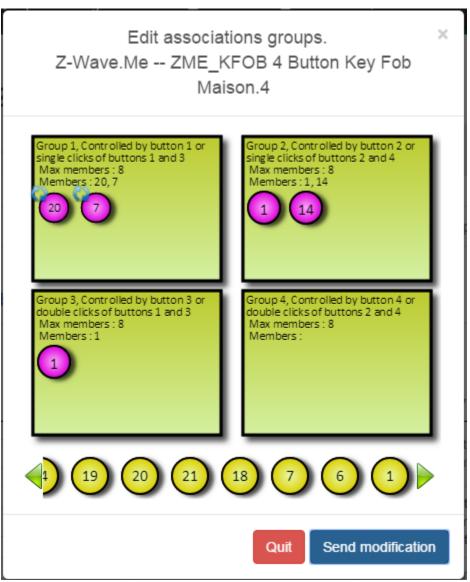

Representation	Message	Description
		mn "NodeId" give status of initializing.
In progress - Can receive messages (Not	Uninitialized	No starting init operation.
linked)	Initialized - not known	Node has completed init, but open-
		zwave don't know is model (shows
		xml openzwave files).
	Completed	Node has full completed init.
011 Bed room	In progress - Can receive messages	Node can now receive messages, but
No.	(Not linked)	his initialization not finish. Probably
Completed		node sleeping. Controller have finish
Current stage : Complete		init, when node awake it state should
		be Completed.
	In progress - Linked to controller	Node is recognize by controller, ini-
		tialization is in progress.
	In progress - Can receive messages	Node can now receive messages, but
	in progress can receive messages	initialization not finish.
	Out of operation	Node is mark as failed, controller
	Out of operation	don't find him.
ondenni	Pointing the mouse over battery icon	n in column "NodeId" give status of battery level.
	Value in %	Fill icon picture level of battery.
N\$		mn "Awake" give status of listening mode.
Routing	Awake	Node is awake, message can send im-
Multilevel	Aware	mediately.
Sensor (1)	Sleeping	Node probably sleeping, message are
Active on network	Siceping	put on send queue.
	Pointing the mouse over icon in colu	
	Primary Controller	Node is primary controller, is the
- Static PC Tue Oct 13	1 Illiary Controller	main device used to configure and
		control a Z-Wave network.
Controller 09:18:45 2015		The only difference between a pri-
Capabilities :		mary and secondary controller is that
Multilevel Primary Controller		the primary is the only one that can be
Remote Beaming Listening		used to add or remove other devices.
Switch 1 Static Update Controller		For this reason, it is usually better for
		the primary controller to be portable,
		since most devices must be added
		when installed in their final location.
	Secondary Controller	There can only be one primary con-
	Secondary Controller	troller - all other controllers are sec-
		ondary controllers.
	Static Update Controller	A Static Update Controller (SUC) is
		a controller that must never be moved
		in normal operation and which can be
		used by other nodes to receive infor-
		mation about network changes.
	Bridge Controller	A bridge controller is able to cre-
		ate virtual nodes that can be associ-
		ated with other controllers to enable
		events to be passed on.
	Routing	Node is a routing device that passes
		messages to other nodes.
	Listening	Node is a setening device that does
		not go to sleep.
	Beaming	Node is a beam capable device
	Security	Node supports security features.
	FLiRS	Node is a frequent setening device
4.2. Get Zwave devices (Nodes) ir		that goes to sleep but can be willen
		up by a beam. Useful to determine
		node and controller consistency
	Buttons on column "Action" get acco	•
	Dations on column Action get acci	on or omero communica on nouch

4.3 Manage association devices (groups)

• Some devices have the ability to be combined with other devices and can send their information.

• These associations are using groups, access to the dialog management groups is done with the button

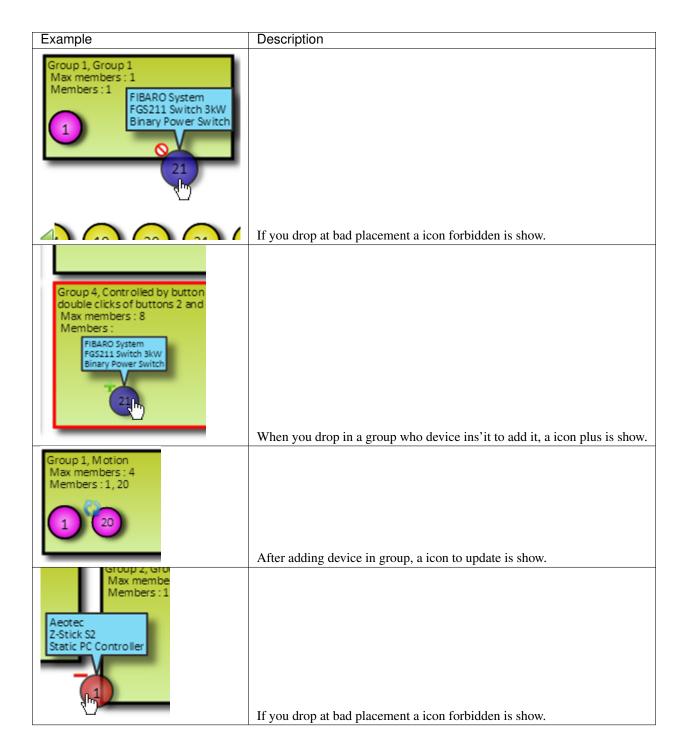

4.3.1 how to use management associations

Note:

- Due to the possibility of sleeping devices, the system considers the command to have been transmitted.
- In the case of a device sleeping command will be transmitted when the device wakes up.
- So the association will be effective as this momment there.

Warning: Careful if the plugin is stopped between time command is lost.

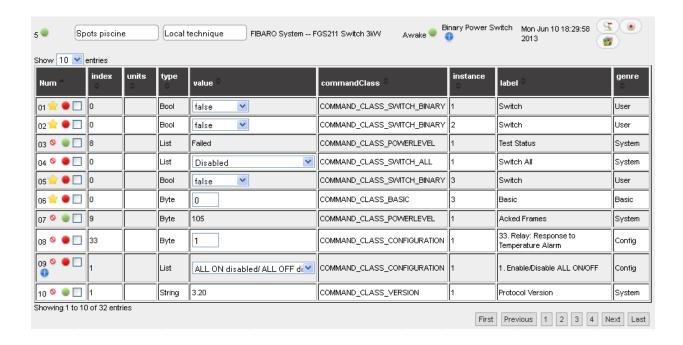

- An icon indicates the status of the device in the group, it may be :
 - unknown
 - confirmed
 - to confirm
 - to update
- The operations are performed by simply drag and drop.
- After making the changes click on \mathbf{OK} to send at the device.
- To quit dialog box click Cancel.
- Actually button **Reset** is not handled.

4.4 Manage devices Commands Class

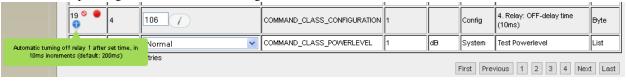

4.4.1 Display commands class list

• All command class are listed in a table.

4.4.2 Change values of command class

- You can edit the values that are in writing, if the value is changed one "Edit" button appears, you must click it to send change at device
- If exist, pointing the mouse over icon "i" give information about command-class.

• When a value of command class is updated, she his tagged during 5 secondes. Pointing the mouse over value give date of update.

4.4.3 Poll service

- Modern devices will not require polling. Some old devices need to be polled as the only way to detect status changes.
- Due to patent concerns, some devices do not report state changes automatically to the controller.

These devices need to have their state polled at regular intervals. The length of the interval is the same for all devices. To even out the Z-Wave network traffic generated by polling, OpenZWave divides the polling interval by the number of devices that have polling enabled, and polls each in turn. It is recommended that if possible, the interval should not be set shorter than the number of polled devices in seconds (so that the network does not have to cope with more than one poll per second).

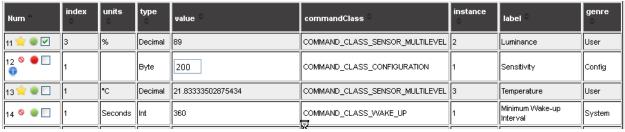

Set time interval

• Set in seconds global interval, click send button to confirm.

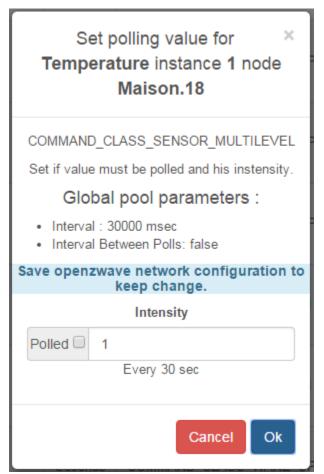

Polling a command class

• In first column a check box give access to poll value.

• A dialog box appeared to confirme action. Here check if polled and set intensity, the number (frequency) of poll during global interval.

Warning:

- Polling sleeping devices put openzwave library in waiting confirmation. This could raise a network error.
- Using an intensity value more 2 could raise a network error.

4.5 Drivers and controller commands

In this section, orders can be sent directly to the driver

4.5.1 Stop and Start driver (controller)

Driver automatically starts and start/stop button automatically changes depending on the state of the driver.

• You can stop it when it's possible : Stop controller confimation dialog aks you to continue.

• You can Start it when it's possible :

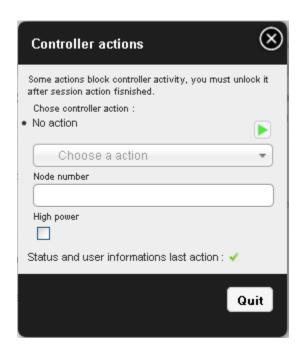

Initialization process running, you must be patient

4.5.2 Controller commands and actions

• You access to dialog box by button

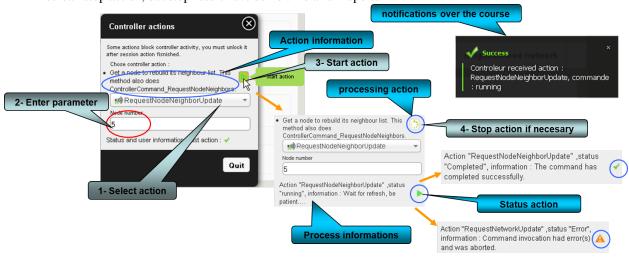

Actions process

- This modal dialog contains informations to guide the user.
- Just actions "CreateButton" and "DeleteButton" are not implemented yet.

Action /	Description
command	
AddDevice	Add a new device (but not a controller) to the Z-Wave network.
CreateNewPri-	Add a new controller to the Z-Wave network. The new controller will be the primary, and
mary	the current primary will become a secondary controller.
ReceiveConfigura-	Receive Z-Wave network configuration information from another controller.
tion	
RemoveDevice	Remove a new device (but not a controller) from the Z-Wave network.
Remove-	Move a node to the controller's failed nodes list. This command will only work if the node
FailedNode	cannot respond.
HasNodeFailed	Check whether a node is in the controller's failed nodes list.
Replace-	Replace a non-responding node with another. The node must be in the controller's list of
FailedNode	failed nodes for this command to succeed.
TransferPrimary-	Make a different controller the primary.
Role	
RequestNet-	Request network information from the SUC/SIS.
workUpdate	
RequestN-	Get a node to rebuild its neighbour list. This method also does
odeNeighborUp-	ControllerCommand_RequestNodeNeighbors.
date	
AssignReturn-	Assign a network return routes to a device.
Route	
DeleteAllReturn-	Delete all return routes from a device.
Routes	
SendNodeInfor-	Send a node information frame.
mation	
ReplicationSend	Send information from primary to secondary.
CreateButton	Create an id that tracks handheld button presses.
DeleteButton	Delete id that tracks handheld button presses.

Schematic processing

- Each action have differents step, some will attempt user action on device, some will take a long time, some must be stop manually.
- You can stop action, but stop result have some time a fail report.

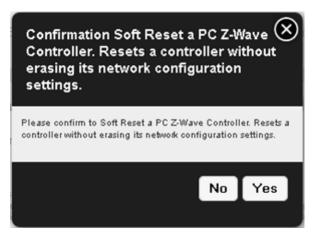

4.5.3 Reset controller

• Two mode possible with acces by buttons:

Soft reset

• Soft Reset a PC Z-Wave Controller who resets a controller without erasing its network configuration settings

Hard reset

Warning: Be careful this action is irreverssible

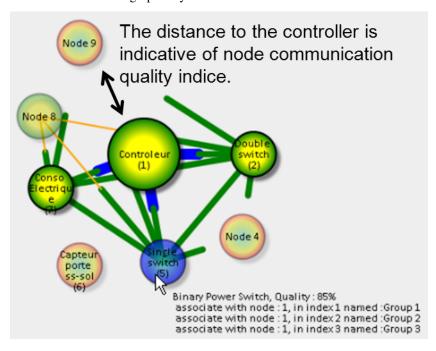

Zwave network tools

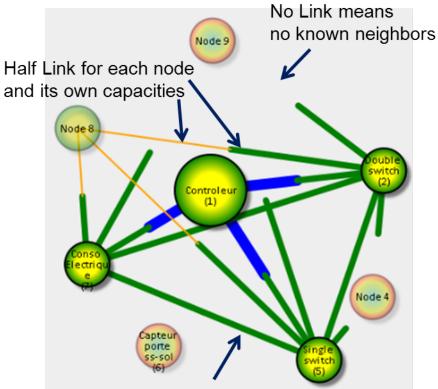

5.1 Graphic neighborhood network

You can refresh graphic by button
 Refresh graph

• You can move nodes and arrange it for better links view, but not function to save position for the moment.

Color and thickness of the link provides the ability of permanent communication

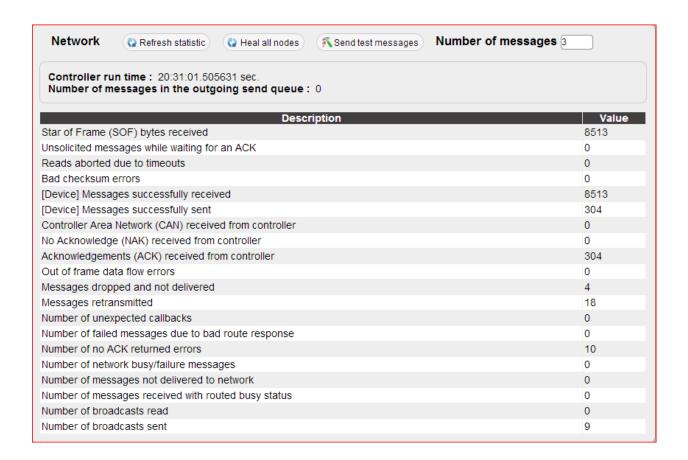

5.1.1 Representation of the node according to the initialisation state.

Node awake	Init state	node sleep- ing
Node 9	Uninitialized	Node 9
Node 9	Initialized - not known	Node 9
Node 9	In progress - Devices initializing	Node 9
Node 9	In progress - Linked to controller	Node 9
Node 9	In progress - Can receive messages	Node 9
Node 9	In progress - Can receive messages (Not linked) Means that node probably sleeping during init process, at his wake-up initialization will be completed.	Node 9
Node 9	Completed	Node 9
Node 9	Out of operation (failed)	Node 9

5.2 Network statistic and tests

Tree actions possible:

- Get information about network statistic.
- Start a healing process with reroute all node (node byn node).
- Send test message for all node awake (not sleeping node) Enter number of send test message per node.

5.3 Node statistic and tests

two actions possible:

- Get information about a node statistic Enter node number and click button refresh.
- Send test message for all node awake (not sleeping node) Enter number of send test message per node.

Note: To heal a specific node use button on column "Action" of nodes table .

5.4 Device test messages

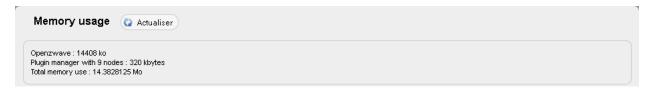

You can send test message to all active nodes, or just one. Enter node number, number of message and click button "Send test messages". Results are display in "Node statistic" section for both case.

Node 2 success test 1/3 in 19 ms.
Node 2 success test 2/3 in 44 ms.
Node 2 success last test 3 in 18 ms, all tests in 94 ms.
Node 5 success test 1/3 in 553 ms.
Node 5 success test 2/3 in 520 ms.
Node 5 success test 2/3 in 520 ms.
Node 7 success test 1/3 in 19 ms, all tests in 1629 ms.
Node 7 success test 2/3 in 18 ms.
Node 7 success test 2/3 in 18 ms.
Node 7 success test 1/3 in 19 ms, all tests in 1691 ms.
Node 8 success test 1/3 in 3182 ms.
Node 10 success test 1/3 in 19 ms, all tests in 4947 ms.
Test Node 8 as recevied time out (10000 ms), 1/3 received.

Support tools

6.1 Memory usage

• A click on button "refresh" show you how memory is use by plugin. It is an estimation.

6.2 Show log file informations

- You can display n lines from beginning or until end of ozwave plugin log file or openzwave lib C++ log when is activate in plugin parameter.
- Select type log, number of line(s) and click button.
- Negative value on number of lines shows full log.

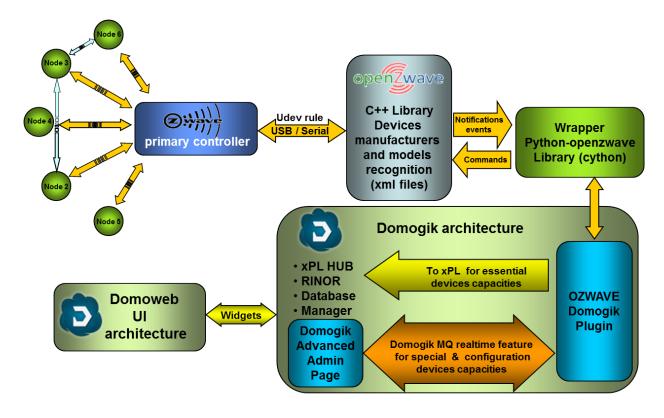

6.3 List of manufacturers and product compatibilities

• You can check all manufacturers and products reognized by openzwave library.

Development informations

7.1 Detailed architecture

Change log

New instructions to apply changes from immediatly previous version.

- 0.4.0b1 [(12-10-2015) Compatibily library][OpenZwave >= 1.3.401, python_openzwave >= 0.3.0 (b4)]
 - Target: python-openzwave, domogik (0.4.1)
 - Update, compile and install python_openzwave.
 - Change log:
 - * New version for domogik 0.4.1
- **0.4.0a1** [(30-03-2014) Compatibily library][OpenZwave >= 1.0.711 (/branches/2013-11-13_release_testing), python_openzwave >= 0.2.5 (rev >= 3bef0f1cb27f)]
 - Target: python-openzwave, domogik (0.4a1)
 - Initial version for domogik 0.4 Source plugin 0.2c4 for domogik 0.3
 - Not usuable, developpement version.

8.1 Historical for domogik version 0.3.x

- **0.2c4** [(31-01-2014) Compatibily library][OpenZwave >= 1.0.711 (/branches/2013-11-13_release_testing), python_openzwave >= 0.2.5 (rev >= 3bef0f1cb27f)]
 - Target: python-openzwave, domogik (0.2c4), domoweb (0.2c3)
 - An insert_data or a reinstall is necessary.
 - Update, compile and install python_openzwave.
 - * checkout openzwave branch: goto python-openzwave/openzwave,
 - * do command: svn checkout http://open-zwave.googlecode.com/svn/branches/2013-11-13_release_testing
 - Change log:
 - * Add heal node/network functions.
 - * Add command class sensor alarm.
 - * Add auto battery level request at wakeup node.
 - * Update doc

- 0.2c3 [(06-01-2014) Compatibily library][OpenZwave >= 1.0.706, python_openzwave >= 0.2.5 (rev >= 75d9b6a8dd77), Compatibilty with ws4py last update >= 0.3.3]
 - Target: OpenZwave, python-openzwave, ws4py, domogik (0.2c3), domoweb (0.2c2)
 - Update ws4py with pip or easy_install or update source and compile it.
 - Update, compile and install python openzwave.

- Change log:

- * GetPollIntensity add in openzwave lib.
- * Add log debug information for wsServer.
- * Fix auto-startup failure (rest no response).
- * Fix automatique COMMAND_CLASS_SENSOR_BINARY type set for xpl (recreate devices and widget for changes).
- * Fix issue in monitornodes xpl-report if no conforme xpl_msg.
- * Fix wsClient error if ack = undefined (domoweb).
- * Force default name for controler device if not defined (CtrlMustBeCreate.1.1).
- * Update doc
- **0.2c2** [(30-10-2013) Compatibily library][The same, Warning in case of ws4py install or update use >= 0.3.0-beta rev eec3a7dcb33b322eac598f5125425e62c0050969, see instructions in dependencies page.]
 - Target : domogik (0.2c2), domoweb (0.2c1)
 - An insert_data or a reinstall is necessary.
 - Knows issue : At auto start plugin fail sometimes, stop it or kill process (\$ps -ef | grep ozwave) and restart it.

- Change log:

- * Add individual monitoring node(s) in log file for debugging and helper develop device compatibilities.
- * Add removing ghost node from groups capability.
- * Add Dimmer multi-controls (FGD211) and bright/dim commands.
- * Add Thermostat setpoint (Danfos living-connect)
- * Add NotifyTransactions option (You must probably modify openzwave lib to fix issues failling plugin start, see doc section options.)
- * Fix wsServer fail connection some time.
- * Fix memory change during websocket sending Broadcast and Ack Message.
- * Fix no display "Support tools" page with some browsers versions.
- * Fix select last controleur action in reopen dialog box.
- * Graph neighbors code improved.
- * Update doc
- **0.2c1** [(15-09-2013) Compatibily library][The same, Warning in case of ws4py install or update use >= 0.3.0-beta rev eec3a7dcb33b322eac598f5125425e62c0050969, see instructions in dependencies page.]
 - Target : domogik.

- Change log:

- * Retrieve domogik device zwave ctrl address from rest.
- * Update doc
- **0.2b5** [(29-07-2013) Compatibily library][OpenZwave >= 1.0.663, python_openzwave >= 0.2.5 (rev >= 18832df1dd95).]
 - Target: python_openzwave, domogik and domoweb.
 - Update, compile and install python_openzwave.
 - An insert_data or a reinstall is necessary.

- Change log:

- * Fix some report controller action.
- * Fix accent on node name and location.
- * Fix display update name and location name just after sended.
- * Fix some actions bug.
- Fix some Exception error.
- * Forced unit conversion F -> °C for temperature device in F.
- * Double xPL message for switch multi-level. (for testing-not sure it's a good idea!)
- * UI dialog node associations improvement.
- * Add device motion binary multi sensor 4-in-1.
- * Add polling command_class. Some limitations: there is an issue with getPollIntensity openzwave lib so for moment function is deactivated and value 1 is always received. Some command class like COMMAND_CLASS_POWERLEVEL seem to enable but the polling is not in effect.
- * Add timer reporting controller status on widget (every 60s) and report status "started plugin, started, init, lock, no-ctrl, ok, stop".
- * Add list of recognized manufacturers and products by openzwave in "support tools" tab.
- * Add force refresh node.
- * Add openzwave log report in "support tools" tab.
- * Add Battery status in tab nodes.
- Update doc.
- **0.2b4** [(05-28-2013) Compatibily library][the same.]
 - Target: domogik and domoweb

- Change log:

- * Fixe bug plugin starting with package installation
- * Add Domoweb version. (first 0.2.b4)
- * Add support tools, memory usage and log report to UI.
- * Change websocket server private plugin to generic usage.
- * Add load xml open-zwave usage, don't finish coding.
- 0.2b3 [Compatibily library][python_openzwave $\geq 0.2.5$ (rev][b434c50b795b), tailer $\geq 0.2.1$]

- Target: python_openzwave, domogik and domoweb
- Update, compile and install python_openzwave
- Install tailer: "sudo pip install tailer" or "sudo easy_install tailer"
- Change log:
 - * Add test network and node
 - * Add id message req-ack
- **0.2b2** [Compatibily library][the same.]
 - Target: domogik and domoweb
 - An insert_data or a reinstall is necessary
 - Change log:
 - * Check user directory and config directory acces
 - * Realtime improvements for graph neighbors
 - * Add Start/Stop driver function
 - * Add zwave device switch with power meter (Everspring (C.T.) AN158 full handling)
 - * Fixe ON/OFF sensor return status
- 0.2b1 [Compatibily library][OpenZwave >= 1.0.645, python_openzwave >= 0.2.5, ws4py >= 0.3.0-beta]
 - Target : domogik and domoweb
 - Install new dependency ws4py 0.3.0-beta
 - An insert_data or a reinstall is necessary
 - Enter new wsportserver key (Plugin configuration) and save the config (necessary to restart plugin if is started)
- 0.1b8:
 - An insert_data or a reinstall is necessary.
 - Created primary controller device for domogik and traced back to the state it to domogik.

8.1.1 Do an insert data

In your domogik directory with user domogik:

\$ src/tools/packages/insert_data.py src/share/domogik/plugins/ozwave.json
