<b>5</b>	<b>Version History</b>	<b>11</b>

Dunder is a small module which extracts `dunder` variables from Python source files.

---

## Example

---

The following example demonstrates the functionality available in the module.

Using the following Python source file `test.py`

```
# -*- coding: utf-8 -*-  
  
# Copyright 2014 Joe Bloggs Inc.  
  
"""Module docstring"""  
  
import datetime  
  
__all__ = ['a']  
  
__version__ = "0.1"  
__author__ = "Joe Bloggs <joe.bloggs@example.com>"  
__wally__ = 1  
__dave__ = 1.1  
__brian__ = (1, 2, 3)  
  
def a():  
    __walter__ = 'dave'
```

Running the following code will extract the ‘dunder’ variables and present them as a dictionary

```
>>> import dunder  
>>> d = dunder.parse('test.py')  
>>> print(d['__version__'])  
0.1  
>>> print(d['__walter__'])  
dave
```

---

**Note:** For lists and tuples only values of a single level are parsed correctly i.e. (1, 2) and [2, ‘s’] work but [1, [3, 5], 6] doesn’t

---

---

### License

---

This module is licensed under the terms of the [Apache V2.0](#) license.

---

## Dependencies

---

Dunder has no external dependencies.

---

## Installation

---

Installation can be performed by using the **pip** command.

```
pip install dunder
```

---

## Version History

---

Version	Description
0.1.1	Use some <a href="#">selfdogfooding</a> in <code>setup.py</code>
0.1	First release
