pypi package 0.4.4 build passing

## 1.1 License

- Free software: BSD license

## 1.2 Features

- describe your API requests in single file (YAML, JSON and XML at this moment) so you can store you API tests with code in same repository (f.i. as ejpiaj.json file)
- file format is detected from file extension .yaml, .json and .xml
- extract variables from responses and store them to use in next requests (f.i. to get and use authorization token)
- write assertions against responses
- register your own variables extractors and assertions
- run suite using `ejpiaj-cli test -m my_addons -s tests.yml` command

Sample yml file:

```
requests:
  001_search_repos_with_django_in_name:
    method: get
    url: https://api.github.com/search/repositories
    url_params:
      q: django
      sort: stars
      order: desc
    variables:
```

```
    json:
      total_count: count
      items.[0].full_name: repo_name
  assertions:
    response:
      - 'status_code equals 200'
    json:
      - 'items.[0].full_name contains ango'

002_get_commits_from_first_repo:
  method: get
  url: https://api.github.com/repos/{{repo_name}}/commits
  assertions:
    response:
      - 'status_code equals 200'
```

Run it:

```
$ ejpiaj-cli test sample.yml -s

-----
P - passed assertions, F - failed assertions, V - extracted variables
-----
✓ 001_search_repos_with_django_in_name [P2,F0,V2] {'count': 29754, 'repo_name': u
↳ 'django/django'}
✓ 002_get_commits_from_first_repo [P1,F0,V0] {}
-----
```

## 1.3 SNI note

In order to support SNI in python 2.6/2.7 you need to install additional packages:

- *pyOpenSSL*, a Python wrapper module around the OpenSSL library.
- *ndg-httpsclient*, enhanced HTTPS support for httplib and urllib2.
- *pyasn1*, ASN.1 types and codecs.

## 1.4 Documentation

- <http://ejpiaj.readthedocs.org/en/latest/>

## CHAPTER 2

---

### Installation

---

At the command line:

```
$ easy_install ejpiaj
```

Or, if you have virtualenvwrapper installed:

```
$ mkvirtualenv ejpiaj  
$ pip install ejpiaj
```

---

## Usage

---

Simple usage with `ejpiaj-cli`.

A `ejpiaj-cli` tool has one command `test`:

```
$ ejpiaj-cli test --help
Usage: ejpiaj-cli test <yaml_file> [<debug>] [<module>] [<display_variables>]
Run tests using yaml file
Required Arguments:
    yaml_file
Options:
    -d --debug    run with debug mode
    -s --display_variables  display extracted variables
    -m --module  your module with custom extractors and assertions
    -e --env     initial variables in format var1=val1&var2=val2
```

A `yaml_file` is file with tests. Debug mode (`-d`) displays logs and returns content from requests.

A `--module` option allows you to specify own module with custom assertions and variables extractors. F.i.:

```
$ ejpiaj-cli test ./myapi.yml --module my_module -s
```

A `-e` allows you to pass initial variables f.i.:

```
$ ejpiaj-cli test ./myapi.yml --module my_module -s -e api_url=localhost
```

And use this variable in `yaml` file:

```
requests:
  001_get_token:
    method: post
    url: http://{{api_url}}/api/v10/api-token-auth/
```

I will explain idea using example `example_full.yml` file:

- [https://github.com/onjin/ejpiaj/blob/master/examples/example\\_full.yml](https://github.com/onjin/ejpiaj/blob/master/examples/example_full.yml)

All requests are written under key `requests`. Every request has unique name. It's name is used to sort request while running, so numeric prefix is very convinient.

Every request is build from elements:

- `method` - request method like 'get', 'post', 'put', 'options' (under the hood is requests library)
- `url` - full url to call
- `url_params` - params added to url after '?' sign
- `form_params` - params used with POST method and PUT
- `body` - POST or PUT body, if used then 'form\_params' will be skipped
- `variables` - variables to extract using registered variables extractors
- `assertions` - assertions to run using also variables extractors and registered assertions

## 3.1 Simple example

First example:

```
requests:
  001_search_repos_with_django_in_name:
    method: get
    url: https://api.github.com/search/repositories
    url_params:
      q: django
      sort: stars
      order: desc
```

Run it with:

```
ejpiaj-cli test -s examples/example_001.yml
```

The result should be:

```
-----
P - passed assertions, F - failed assertions, V - extracted variables
-----
✓ 001_search_repos_with_django_in_name [P0,F0,V0] {}
-----
```

P0 means 0 passed assertions, F0 means 0 failed assertions, V0 means 0 extracted variables

## 3.2 Assertions

Now we are going to add first assertions:

```
requests:
  001_search_repos_with_django_in_name:
    method: get
    url: https://api.github.com/search/repositories
    url_params:
      q: django
      sort: stars
      order: desc
    assertions:
      response:
        - 'status_code equals 200'
      json:
        - 'items.[0].full_name contains angoo'
```

Run it with:

```
ejpijaj-cli test -s examples/example_002.yml
```

The result should be:

```
-----
P - passed assertions, F - failed assertions, V - extracted variables
-----
✓ 001_search_repos_with_django_in_name [P2,F0,V0] {}
-----
```

Under key *assertions* we put any variables extractor registered name (json, request). Under this key we put list of assertions in format:

```
variable assertions parameter
```

variables is variable extractor parameter, assertion is assertion keyword and parameter is optional parameter for assertion (depends on assertion type)

In this example we used *response* extractor:

```
response:
  - 'status_code equals 200'
```

So we told *response* extractor to get *status\_code* attribute from response object and test if it equals to 200

We used also *json* extractor:

```
json:
  - 'items.[0].full_name contains angoo'
```

So we told *json* extractor to get *items.[0].full\_name* from response:

```
{
  "total_count": 29532,
  "items": [
    {
      "id": 4164482,
      "name": "Django",
```

```

    "full_name": "django/django",
    "owner": {
      ...
    },
  }
}

```

and check if the *full\_name* contains word *ango*

### 3.3 Variables extracting

We can use variables extractors to extract and store variables for further usage in next requests.

Extracting and using variables:

```

requests:
  001_search_repos_with_django_in_name:
    method: get
    url: https://api.github.com/search/repositories
    url_params:
      q: django
      sort: stars
      order: desc
    variables:
      json:
        total_count: count
        items.[0].full_name: repo_name
    assertions:
      response:
        - 'status_code equals 200'
      json:
        - 'items.[0].full_name contains ango'

  002_get_commits_from_first_repo:
    method: get
    url: https://api.github.com/repos/{{repo_name}}/commits
    assertions:
      response:
        - 'status_code equals 200'

```

Run it with:

```
ejpiaj-cli test -s examples/example_003.yml
```

The result should be:

```

-----
P - passed assertions, F - failed assertions, V - extracted variables
-----
✓ 001_search_repos_with_django_in_name [P2,F0,V2] {'count': 29532, 'repo_name': u
↪ 'django/django'}
✓ 002_get_commits_from_first_repo [P1,F0,V0] {}
-----

```

We simply added *variables* key and used same variable extractor as in *assertions*:

```
variables:  
  json:  
    total_count: count  
    items.[0].full_name: repo_name
```

And now we have variables:

```
count = 29532  
repo_name = django/django
```

And we can use those variables in next request:

```
002_get_commits_from_first_repo:  
  method: get  
  url: https://api.github.com/repos/{{repo_name}}/commits
```

Variables are put between '{{' and '}}' and **can't** contains spaces'. For example:

```
{{repo_name}} - it's good  
{{ repo_nama}} - it's wrong
```

## 3.4 Full example

Now you can could understand full example at file:

- [https://github.com/onjin/ejpiaj/blob/master/examples/example\\_full.yml](https://github.com/onjin/ejpiaj/blob/master/examples/example_full.yml)

---

## Variables extractors

---

Variables extractors are used to extract variables for assertions or to store them and use in next requests.

### 4.1 Builtin variables extractors

#### 4.1.1 response

A **response** variables extractor gives you access to attributes of response objects:

- <http://requests.readthedocs.org/en/latest/user/advanced/#request-and-response-objects>

Usage:

```
variables:
  response:
    status_code: last_code

assertions:
  response:
    - 'status_code equals 200'
```

#### 4.1.2 json

An **json** extractor treats response content as json. You can access json body using python dictionary syntax.

Usage:

```
variables:
  json:
    '[0].sha': sha1
    '[1].sha': sha2
    '[2].sha': sha3
```

```
assertions:
  json:
    - 'items.[0].full_name contains ango'
```

## 4.2 Custom variables extractors

You can easily create your own extractors by creating python file with code:

```
import re

import json

from ejpiaj.decorators import variable_extractor

@variable_extractor('json2')
def json2_variables_extractor(response, variables):
    """Extracts variables from json response.content.

    Variables path are written using 'dot' access and index access to lists
    f.i.:
        some.path.to.list.[0]
        [1].dict.access.later
    """
    result = {}
    re_list = re.compile('^\\[\\d+\\]$')

    # use 'dot' access to dictionary
    data = json.loads(response.content)
    for path, name in variables.items():
        try:
            subdata = data
            for attr in path.split('.'):
                # support for list access [0]
                if re_list.match(attr):
                    ind = int(attr[1:-1])
                    subdata = subdata[ind]
                else:
                    subdata = subdata.get(attr)
            result[name] = subdata
        except:
            result[name] = None
    return result
```

From now you can use `json2` variables extractor in your tests:

```
variables:
  json2:
    myvar: varname
```

by running `ejpiaj-cli` with your module:

```
$ ejpiaj-cli test -s --module myfile mytest.yml
```

Assertions are used to check extracted variables against your tests.

### 5.1 Builtin assertions

#### 5.1.1 equals / notequals

Example:

```
assertions:
  response:
    - 'status_code equals 200'
    - 'status_code notequals 500'
```

#### 5.1.2 in / notin

Example:

```
assertions:
  response:
    - 'status_code in 200,301,302'
    - 'status_code notin 404,500'
```

#### 5.1.3 empty / notempty

Example:

```
assertions:
  response:
```

```
- 'contentText empty'  
- 'contentText notempty'
```

## 5.1.4 contains / notcontains

Example:

```
assertions:  
  response:  
    - 'contentText contains Hello'  
    - 'contentText notcontains World'
```

## 5.2 Custom assertions

You can easily create your own assertions:

```
from ejpiaj.decorators import assertion  
  
@assertion('false')  
def equals_assertion(value):  
    return value == False
```

From now you can use `false` assertion in your tests:

```
assertions:  
  response:  
    - 'status_code false'
```

by running `ejpiaj-cli` with your module:

```
$ ejpiaj-cli test -s --module myfile mytest.yml
```

### 6.1 Post body

Example:

```
requests:
  001_token_post:
    method: post
    url: https://example.com/webapi/v1/token
    headers: ~
    url_params:
      lang: pl
    form_params: ~
    body: '{"username":"user", "password":"bestpass"}'

    assertions:
      response:
        - 'status_code in 200'
    variables:
      json:
        token: token
```

### 6.2 Authenticate by header

Example:

```
requests:
  001_get_token:
    method: post
    url: http://localhost:8000/api/v10/api-token-auth/
    form_params:
      username: apitest
```

```
password: apitest
variables:
  json:
    token: token
assertions:
  response:
    - 'status_code equals 200'
  json:
    - 'token notempty'

002_get_users:
  method: get
  url: http://localhost:8000/api/v10/users/
  headers:
    Authorization: Token {{token}}
  assertions:
    response:
      - 'status_code equals 200'
```

## 7.1 ejpaj package

### 7.1.1 Submodules

#### 7.1.2 ejpaj.assertions module

`ejpaj.assertions.contains_assertion` (*value*, *params*)

`ejpaj.assertions.empty_assertion` (*value*)

`ejpaj.assertions.equals_assertion` (*value*, *params*)

`ejpaj.assertions.in_assertion` (*value*, *params*)

`ejpaj.assertions.notcontains_assertion` (*value*, *params*)

`ejpaj.assertions.notempty_assertion` (*value*)

`ejpaj.assertions.notequals_assertion` (*value*, *params*)

`ejpaj.assertions.notin_assertion` (*value*, *params*)

#### 7.1.3 ejpaj.core module

`ejpaj.core.check_assertion` (*expression*, *value*)

`ejpaj.core.test_request` (*request*, *variables*)

#### 7.1.4 ejpaj.decorators module

`ejpaj.decorators.assertion` (*key*)

`ejpaj.decorators.variable_extractor` (*key*)

## 7.1.5 ejpiaj.parsers module

## 7.1.6 ejpiaj.registry module

**exception** `ejpiaj.registry.UnregisteredAssertion`

Bases: `exceptions.Exception`

**exception** `ejpiaj.registry.UnregisteredVariablesExtractor`

Bases: `exceptions.Exception`

`ejpiaj.registry.get_assertion` (*name*)

`ejpiaj.registry.get_assertions` ()

`ejpiaj.registry.get_variables_extractor` (*name*)

`ejpiaj.registry.get_variables_extractors` ()

`ejpiaj.registry.register_assertion` (*name*, *assertion*)

`ejpiaj.registry.register_variables_extractor` (*name*, *extractor*)

`ejpiaj.registry.unregister_assertion` (*name*)

`ejpiaj.registry.unregister_variables_extractor` (*name*)

## 7.1.7 ejpiaj.runner module

## 7.1.8 ejpiaj.variable\_extractor module

`ejpiaj.variable_extractor.json_variables_extractor` (*response*, *variables*)

Extracts variables from json `response.content`.

Variables path are written using 'dot' access and index access to lists f.i.:

`some.path.to.list.[0][1].dict.access.later`

`ejpiaj.variable_extractor.response_variables_extractor` (*response*, *variables*)

## 7.1.9 Module contents

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

## 8.1 Types of Contributions

### 8.1.1 Report Bugs

Report bugs at <https://github.com/onjin/ejpiaj/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

### 8.1.2 Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” is open to whoever wants to implement it.

### 8.1.3 Implement Features

Look through the GitHub issues for features. Anything tagged with “feature” is open to whoever wants to implement it.

## 8.1.4 Write Documentation

ejpiaj could always use more documentation, whether as part of the official ejpiaj docs, in docstrings, or even on the web in blog posts, articles, and such.

## 8.1.5 Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/onjin/ejpiaj/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## 8.2 Get Started!

Ready to contribute? Here's how to set up *ejpiaj* for local development.

1. Fork the *ejpiaj* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/ejpiaj.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv ejpiaj
$ cd ejpiaj/
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass flake8 and the tests, including testing other Python versions with tox:

```
$ tox
```

To get flake8 and tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## 8.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 2.6, 2.7, and 3.3, and for PyPy. Check [https://travis-ci.org/onjin/ejpiaj/pull\\_requests](https://travis-ci.org/onjin/ejpiaj/pull_requests) and make sure that the tests pass for all supported Python versions.

### 9.1 Development Lead

- Marek Wywiał <onjinx@gmail.com>

### 9.2 Contributors

None yet. Why not be the first?

### **10.1 0.4.4 (2015-01-21)**

- Fixed unicode errors while reading str/int parameters

### **10.2 0.4.3 (2014-09-10)**

- Fixed compatibility with python 3.3

### **10.3 0.4.2 (2014-09-10)**

- Fixed context replacing at variables replacing

### **10.4 0.4.1 (2014-09-10)**

- Fixed non unicode extracted variables

### **10.5 0.4.0 (2014-03-11)**

- Added support for xml and json files

### **10.6 0.3.3 (2014-03-06)**

- Added `-e / --env` option to `ejpiaj-cli` to pass initial variables

- Added `-q / --quiet` option to `ejpaj-cli` to quiet output

## **10.7 0.3.2 (2014-02-17)**

- Added `-s` option to `ejpaj-cli` to display extracted variables

## **10.8 0.3.1 (2014-02-17)**

- Fixed loading custom module from current directory

## **10.9 0.3.0 (2014-02-16)**

- Added support to load own module with custom assertions and variable extractors using `ejpaj-cli` tool

## **10.10 0.2.3 (2014-02-10)**

- Fixed tests order (alphabetical)

## **10.11 0.2.2 (2014-02-10)**

- Fixed variable substitution for multi variables
- Added variable substitution in `'url'`

## **10.12 0.2.1 (2014-02-07)**

- Fixed variables substitution if variable is `None`

## **10.13 0.2.0 (2014-02-07)**

- Added support for `form_params` and `headers`

## **10.14 0.1.0 (2014-02-01)**

- First release on PyPI.
