About Globo NetworkAPI WebUI

Description

Globo NetworkAPI WebUI is a Front End tool to manage and automate networking resources (routers, switches and load balancers) and document logical and physical networking.

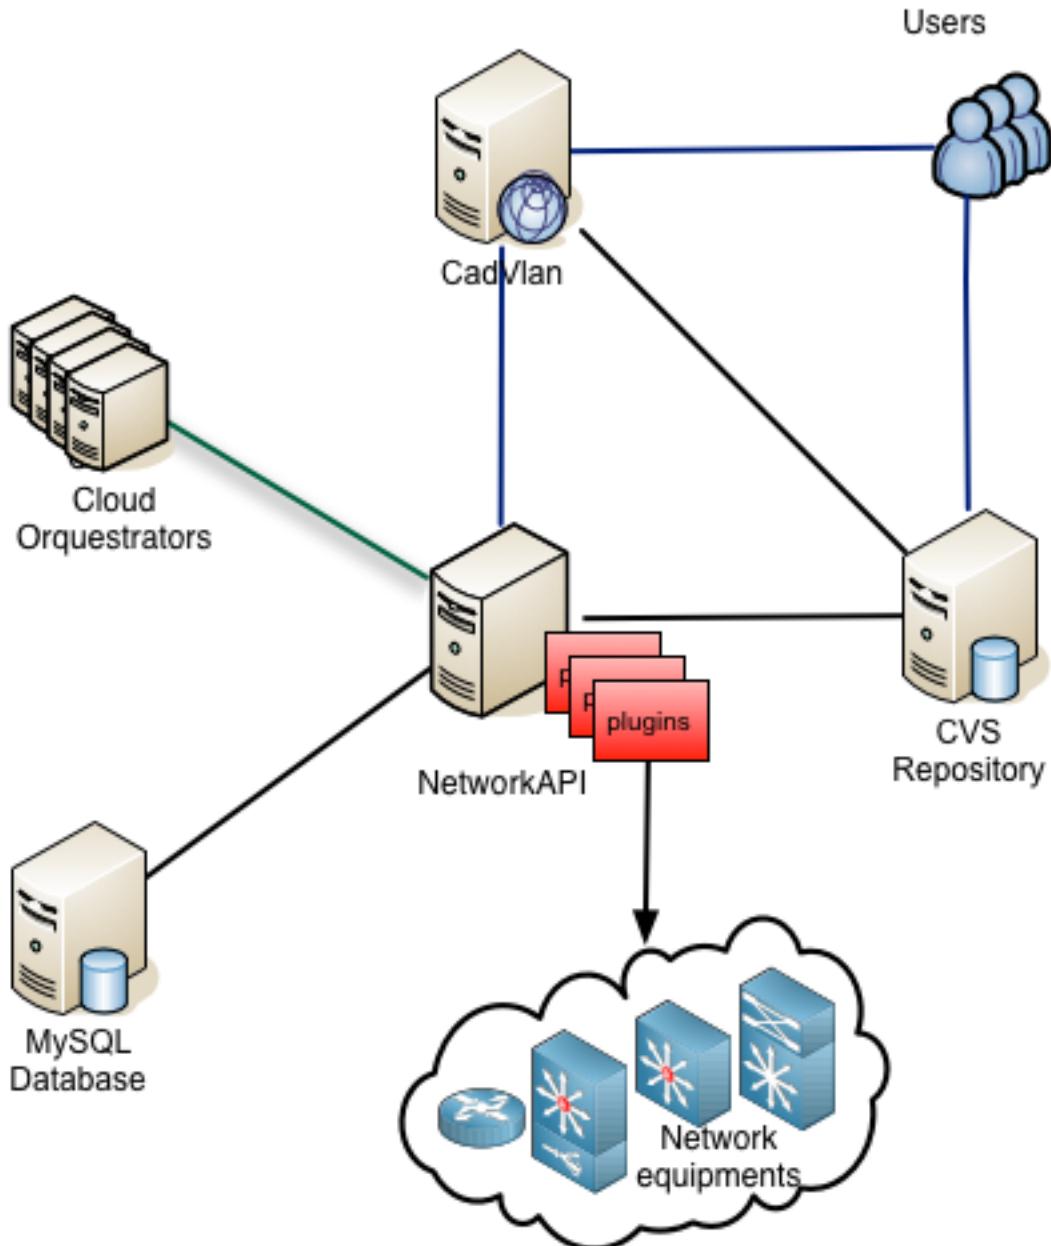

They were created to be vendor agnostic and to support different orchestrators and environments without loosing the centralized view of all network resources allocated.

It was not created to be and inventory database, so it does not have CMDB functionalities.

Features

- LDAP authentication
- Supports cabling documentation (including patch-panels/DIO's)
- Separated Layer 2 and Layer 3 documentation (vlan/network)
- IPv4 and IPv6 support
- Automatic allocation of Vlans, Networks and IP's
- ACL (access control list) automation (documentation/versioning/applying)
- Load-Balancer support
- Automated deploy of allocated resources on switches, routers and load balancers
- Load balancers management
- Expandable plugins for automating configuration

Architecture

Related Projects

Globo NetworkAPI.

Globo NetworkAPI Python Client.

Globo NetworkAPI Python Java.

Installing GloboNetworkAPI WebUI

Using pre-configured VM

In order to use the pre-configured VM you need to have *vagrant* <<https://www.vagrantup.com/downloads.html>> and *VirtualBox* <<https://www.virtualbox.org/wiki/Downloads>> installed in your machine.

After that, go to the directory you want to install and do:

```
git clone https://github.com/globocom/GloboNetworkAPI-WebUI
cd GloboNetworkAPI-WebUI
vagrant plugin install vagrant-omnibus
vagrant up
```

After this you'll have the WebUI running on <http://10.0.0.3:8080/>

Installing from scratch

Following examples were based on CentOS 7.0.1406 installation.

All root passwords were configured to “default”.

Create a specific User/Group

```
useradd -m -U webui
passwd webui
visudo
    webui      ALL=(ALL)      ALL

sudo mkdir /opt/app/
sudo chmod 777 /opt/app/
```

Download Code

Download GloboNetworkAPI code from [Globocom GitHub](#).

In this example we are downloading code to `/opt/app/`:

```
sudo yum install git
cd /opt/app/
git clone https://github.com/globocom/GloboNetworkAPI-WebUI
```

We are exporting this variable below to better document the install process:

```
export WEBUI_FOLDER=/opt/app/GloboNetworkAPI-WebUI/
echo "export WEBUI_FOLDER=/opt/app/GloboNetworkAPI-WebUI/" >> ~/.bashrc
```

Create a VirtualEnv

```
sudo yum install python-virtualenv
sudo easy_install pip
virtualenv ~/virtualenvs/webui_env
source ~/virtualenvs/webui_env/bin/activate
echo "source ~/virtualenvs/webui_env/bin/activate" >> ~/.bashrc
```

Install Dependencies

You will need the following packages in order to install the next python packages via pip:

```
sudo yum install gcc
yum install openldap-devel
```

Install the packages listed on \$WEBUI_FOLDER/requirements.txt file:

```
pip install -r $WEBUI_FOLDER/requirements.txt
```

Create a sitecustomize.py inside your /path/to/lib/python2.X folder with the following content:

```
import sys
sys.setdefaultencoding('utf-8')

echo -e "import sys\nsys.setdefaultencoding('utf-8')\n" > ~/virtualenvs/webui_env/lib/python2.7/site
```

Install Memcached

You can run memcached locally or you can set file variable CACHES{default}{LOCATION} to use a remote memcached farm in file \$WEBUI_FOLDER/settings.py.

In case you need to run locally:

```
sudo yum install memcached
sudo systemctl start memcached
sudo systemctl enable memcached
```

HTTP Server Configuration

For a better performance, install Green Unicorn to run NetworkAPI.

```
pip install gunicorn
```

There is no need to install a nginx or apache to proxy pass the requests, once there is no static files in the API.

Edit \$WEBUI_FOLDER/gunicorn.conf.py to use your log files location and user preferentes and run gunicorn:

```
cd $WEBUI_FOLDER/  
gunicorn wsgi:application
```

Install CVS

You will need the JDK software in order to install CVS

```
sudo yum install java-x-openjdk.x86_64
```

Set the JAVA_HOME variable with the path to java folder

```
JAVA_HOME=/etc/java-x-openjdk.x86_64
```

Download CVS software

```
sudo yum install cvs
```

Uncomment and set the variable CVS_JAVA_HOME in cvs.sh

Run cvs

Put the following command in .bashrc

```
export CVSROOT=:pserver:<user>@<host>:</path>
```

Folder: GloboNetworkAPI-WebUI/Cadvlan/ACLS:

```
cvs checkout <repo>/ACLS
```

Test installation

Try to access the root location of the API:

```
http://your_location:8080/
```

This should take you the login page.

LDAP Server Configuration

If you want to use LDAP authentication, configure the following variables in FILE:

!TODO

Working with Documentation

If you want to generate documentation, you need the following python modules installed:

```
pip install sphinx==1.2.2
pip install sphinx-rtd-theme==0.1.6
pip install pytest==2.2.4
```

CadVlan.Auth.models module

```
class CadVlan.Auth.models.User (id, user, nome, email, pwd, permission, ativo, user_ldap)
    Bases: object

    get_active()
    get_email()
    get_id()
    get_name()
    get_password()
    get_permission()
    get_user_ldap()
    get_username()

    has_perm(permission, write=None, read=None)
        Validates that the user has access permission
```

Parameters

- **permission** – access permission to be validated
- **write** – permission be write
- **read** – permission be read

```
has_perm_menu(write=None, read=None)
    Validates that the user has access permission in top menu
```

Parameters

- **write** – permission be write
- **read** – permission be read

```
set_password(password)
```

classmethod create (file_name)
Creating File
Parameters file_name – File name

Raises `FileError` Failed to creating file

classmethod `read(file_name)`
Reading File

Parameters `file_name` – File name

Raises `FileError` Failed to reading file

classmethod `remove(file_name)`
Removing File

Parameters `file_name` – File name

Raises `FileError` Failed to removing file

classmethod `write(file_name, content)`
Writing File

Parameters

- `file_name` – File name
- `content` – File content

Raises `FileError` Failed to writing file

exception `CadVlan.Util.file.FileError(error)`
Bases: `exceptions.Exception`
