1.1	Version 0.2, October 20, 2016	3
1.2	Version 0.1, August 31, 2015	3

HTTPony (pronounced aych-tee-tee-pony) is a simple HTTP server that pretty prints HTTP requests to a terminal. It is a useful aide for developing clients that send HTTP requests. HTTPony acts as a sink for a client so that a developer can understand what the client is sending.

HTTPony is [developed on GitHub](#).

Synopsis:

```
$ pip install httpony
Successfully installed httpony
$ httpony
Making all your dreams for a pony come true on http://localhost:8000.
Press Ctrl+C to quit.
```

See the [README](#) for an example.

CHAPTER 1
