6.1.2	I/O helper and output file parsers	14
7	Indices and tables	19
	Python Module Index	21
	Index	23

This package was developed in the process of developing the [AiiDA-FLEUR](#) and [AiiDA_KKR](#) plugins to [AiiDA](#). It contains helper functions that can help with common pre and preprocessing steps of the [FLEUR](#) and [KKR](#) codes developed at the Forschungszentrum Jülich (see also the [juDFT](#) website for more information).

If you use this package please cite: ...

CHAPTER 1

Requirements to use this code:

- lxml
- ase
- maschi-tools

CHAPTER 2

Installation Instructions:

Install from pypi the latest release:

```
$ pip install masqi-tools
```

or from the aiida-fleur source folder any branch:

```
$ pip install .  
# or which is very useful to keep track of the changes (developers)  
$ pip install -e .
```

CHAPTER 3

Acknowledgments:

We acknowledge partial support from the EU Centre of Excellence “MaX – Materials Design at the Exascale” (<http://www.max-centre.eu>). (Horizon 2020 EINFRA-5, Grant No. 676598) We thank the AiiDA team for their help and work. Also the vial exchange with developers of AiiDA packages for other codes was inspiring.

CHAPTER 4

User's Guide

CHAPTER 5

Developer's Guide

6.1 Source code Documentation (API reference)

6.1.1 Visualisation and Plotting

`masci_tools.vis.kkr_plot_shapefun.change_zoom(ax, zoom_range, center=[0, 0, 0])`

Change the zoom of a 3d plot

Author Philipp Ruessmann

Parameters

- **ax** – axis which is zoomed
- **zoom_range** – range to which the image is zoomed, total range from center-zoom_range to center+zoom_range
- **center** – center of the zoomed region (optional, defaults to origin)

`masci_tools.vis.kkr_plot_shapefun.plot_shapefun(pos, out, mode)`

Creates a simple matplotlib image to show the shapefunctions given it's positions in the unit cell, the atoms's vertices in *ut* and the plotting mode

Author Philipp Ruessmann

Parameters

- **pos** – positions of the centers of the cells
- **verts** – array of vertices of the shapefunction (outlines of shapes)
- **mode** – 'all' or 'single' determines whether or not all shapes are combined in a single figure or plotted as individual figures

Returns ax return the axis in which the plot was done (useful to pass to 'change_zoom' and 'zoom_in' functions of this module)

`masci_tools.vis.kkr_plot_shapefun.zoom_in(ax, atm, pos, zoom_range=10)`
 Zoom into shapefun of a single atom

Author Philipp Ruessmann

Parameters

- **ax** – axis in which shapefun plot is found
- **atm** – atom index whose shapefunction is zoomed
- **pos** – array of positions of centers of the shapes (needed to shift center of zommed region to correct atom)
- **zoom_range** – range of the zoomed region (optional, defaults to 10)

6.1.2 I/O helper and output file parsers

Here commonly used functions that do not need aiida-stuff (i.e. can be tested without a database) are collected.

`masci_tools.io.common_functions.angles_to_vec(magnitude, theta, phi)`
 convert (magnitude, theta, phi) to (x,y,z)

theta/phi need to be in radians!

Input can be single number, list of numpy.ndarray data Returns x,y,z vector

`masci_tools.io.common_functions.convert_to_pystd(value)`
 Recursively convert numpy datatypes to standard python, needed by aiida-core. Usage:

```
converted = convert_to_pystd(to_convert)
```

where *to_convert* can be a dict, array, list, or single valued variable

`masci_tools.io.common_functions.get_corestates_from_potential(potfile='potential')`
 Read core states from potential file

`masci_tools.io.common_functions.get_ef_from_potfile(potfile)`
 extract fermi energy from potfile

`masci_tools.io.common_functions.get_highest_core_state(nstates, energies, lmoments)`
 Find highest lying core state from list of core states, needed to find and check energy contour

`masci_tools.io.common_functions.interpolate_dos(dosfile, return_original=False)`
 interpolation function copied from complexdos3 fortran code

Principle of DOS here: Two-point contour integration for DOS in the middle of the two points. The input DOS and energy must be complex. Parameter *deltae* should be of the order of magnitude of *eim*:

Parameters input – either absolute path of ‘complex.dos’ file or file handle to it

Returns E_Fermi, numpy array of interpolated dos

Note output units are in Ry!

`masci_tools.io.common_functions.open_general` (*filename_or_handle*, *iomode='u'r'*)

Open a file directly from a path or use a file handle if that is given. Also take care of closed files by reopening them. This is intended to be used like this:

```
f = open_general(outfile)
with f: # make sure the file is properly closed
    txt = f.readlines()
```

`masci_tools.io.common_functions.vec_to_angles` (*vec*)

converts vector (x,y,z) to (magnitude, theta, phi)

Io routines for band structure files

`masci_tools.io.io_fleur_bands.read_fleur_banddos_hdf` (*filepath*)

Reads in the banddos.hdf file from the FLEUR code

returns a dictionary containing all datasets with multidim numpy arrays and also containing the attributes of the groups

Parameters `filepath` – path to the banddos.hdf file

Returns `xcoord`, `bands`, `xlabels`, `band_character`, `band_char_label`,
`kpoints`, `weights`, `rep_cell`, `cell`, `positions`, `atomicnumbers`, `special_point_pos`

Expected file content: datasets [`u'bravaisMatrix'`,

`u'numFoundEigenvals'`, `u'specialPointIndices'`, `u'ILikeCharge'`, `u'positions'`, `u'atomicNumbers'`,
`u'coordinates'`, `u'weights'`, `u'reciprocalCell'`, `u'eigenvalues'`, `u'specialPointLabels'`,
`u'equivAtomsGroup'`]

attributes: {`u'lastFermiEnergy'`: array([0.20852455]),

`u'maxL'`: array([3], dtype=int32), `u'nAtoms'`: array([2], dtype=int32), `u'nSpecialPoints'`: array([7],
dtype=int32), `u'nTypes'`: array([1], dtype=int32), `u'neigd'`: array([19], dtype=int32), `u'nkpt'`: ar-
ray([100], dtype=int32), `u'spins'`: array([1], dtype=int32), `u'version'`: array([1], dtype=int32)}

IO routines for hdf

`masci_tools.io.io_hdf5.read_hdf` (*filepath*)

Reads in an hdf file and returns its context in a nested dictionary

!Only works for files with unique group and dataset names

class `masci_tools.io.kkr_params.kkrparams` (***kwargs*)

Class for creating and handling the parameter input for a KKR calculation Optional keyword arguments are passed to init and stored in values dictionary.

Example usage: `params = kkrparams(LMAX=3, BRAVAIS=array([[1,0,0], [0,1,0], [0,0,1]]))`

Alternatively values can be set afterwards either individually with `params.set_value('LMAX', 3)`

or multiple keys at once with `params.set_multiple_values(EMIN=-0.5, EMAX=1)`

Other useful functions: - print the description of a keyword: `params.get_description([key])` where [key] is a string for a keyword in `params.values` - print a list of mandatory keywords: `params.get_all_mandatory()` - print a list of keywords that are set including their value: `params.get_set_values()`

Note: KKR-units (e.g. atomic units with energy in Ry, length in a_Bohr) are assumed except for the keys '<RLEFT>', '<RBRIGHT>', 'ZPERIODL', and 'ZPERIODR' which should be given in Ang. units!

fill_keywords_to_inputfile (*is_voro_calc=False, output=u'inputcard'*)
 Fill new inputcard with keywords/values automatically check for input consistency if *is_voro_calc==True* change mandatory list to match voronoi code, default is KKRcode

classmethod get_KKRcalc_parameter_defaults (*silent=False*)
 set defaults (defined in header of this file) and returns dict, kkrparams_version

get_all_mandatory ()
 Return a list of mandatory keys

get_description (*key*)
 Returns description of keyword 'key'

get_dict (*group=None, subgroup=None*)
 Returns values dictionary.
 Prints values belonging to a certain group only if the 'group' argument is one of the following: 'lattice', 'chemistry', 'accuracy',
 'external fields', 'scf cycle', 'other'
 Additionally the subgroups argument allows to print only a subset of all keys in a certain group. The following subgroups are available: in 'lattice' group: '2D mode', 'shape functions' in 'chemistry' group: 'Atom types', 'Exchange-correlation', 'CPA mode',
 '2D mode'
in 'accuracy' group: 'Valence energy contour', 'Semicore energy contour', 'CPA mode', 'Screening clusters', 'Radial solver', 'Ewald summation', 'LLoyd'

get_missing_keys (*use_aiida=False*)
 Find list of mandatory keys that are not yet set

get_set_values ()
 Return a list of all keys/values that are set (i.e. not None)

get_type (*key*)
 Extract expected type of 'key' from format info

get_value (*key*)
 Gets value of keyword 'key'

is_mandatory (*key*)
 Returns mandatory flag (True/False) for keyword 'key'

items ()
 make kkrparams.items() work

read_keywords_from_inputcard (*inputcard=u'inputcard'*)
 Read list of keywords from inputcard and extract values to keywords dict
Example usage p = kkrparams(); p.read_keywords_from_inputcard('inputcard')
Note converts '<RBLEFT>', '<RBRIGHT>', 'ZPERIODL', and 'ZPERIODR' automatically to Ang. units!

remove_value (*key*)
 Removes value of keyword 'key', i.e. resets to None

set_multiple_values (***kwargs*)
 Set multiple values (in example value1 and value2 of keywords 'key1' and 'key2') given as key1=value1, key2=value2

set_value (*key, value, silent=False*)

Sets value of keyword 'key'

classmethod split_kkr_options (*valtxt*)

Split keywords after fixed length of 8 :param valtxt: list of strings or single string :returns: List of keywords of maximal length 8

update_to_kkrimp ()

Update parameter settings to match kkrimp specification. Sets self.__params_type and calls _update_mandatory_kkrimp()

update_to_voronoi ()

Update parameter settings to match voronoi specification. Sets self.__params_type and calls _update_mandatory_voronoi()

`masci_tools.io.kkr_read_shapefun_info.read_shapefun` (*path='.'*)

Read vertices of shapefunctions with Zoom into shapefun of a single atom

Author Philipp Ruessmann

Parameters *path* – path where voronoi output is found (optional, defaults to './')

Returns *pos* positions of the centers of the shapefunctions

Returns out dictionary of the vertices of the shapefunctions

CHAPTER 7
