## Manage translations in Django projects

Mobetta is a reusable app to manage translation files in Django projects.

It's inspired on [django-rosetta](#), but takes a more modern approach to problem and adds extra features, such as:

- comments on translations
- edit history
- support for [ICU message format](#) with json catalogs

# CHAPTER 1

---

## Installation

---

The [Quickstart](#) section covers the basic installation without any extra plugins.

### ICU message files

ICU message files support is optional, and can be installed in one go with:

```
pip install mobetta[icu]
```

Since this is set-up as a Django app as well, you'll need to add it to INSTALLED\_APPS:

```
INSTALLED_APPS = [
    ...,
    'mobetta',
    'mobetta.icu',
    ...,
]
```

Migrate your database to finalize the installation:

```
python manage.py migrate
```

### Contributor

You can install the library with all the dev-dependencies with:

```
pip install -e .[icu,test,docs]
```

# CHAPTER 2

---

## Usage

---

See the index page [Usage](#) for base-usage instructions. This covers the Django po/mo files.

### ICU message files

The ICU message format is popular in the frontend, and it's quite different from .po files. Django does not support them (out of the box).

After [installing](#) the ICU message plugin, you can still manage your translations with mobetta.

Navigate to the translation interface (localhost:8000/admin/mobetta/) and locate the ICU translation files. Create a new translation file, and point it to the JSON file containing the translations.

Currently, the only supported format is simple key-values, for example `src/locale/en.json`

```
{  
    "myapp.unique.identifier": "My app is awesome!",  
    "myapp.unique.identifier2": "My app is translated!"  
}
```

The translations are checked to have a valid [ICU message format](#).

# CHAPTER 3

---

## Quickstart

---

Install with pip:

```
pip install mobetta
```

Add it to your installed apps:

```
INSTALLED_APPS = [
    ...,
    'mobetta',
    ...,
]
```

Hook up the urls in your root urls.py:

```
urlpatterns = [
    url(r'^admin/', include(admin.site.urls)), # optional
    url(r'^admin/mobetta/', include('mobetta.urls', namespace='mobetta')),
    ...
]
```

Run migrate to create the necessary database tables:

```
python manage.py migrate
```

# CHAPTER 4

---

## Usage

---

Mobetta discovers your translation files with a management command:

```
python manage.py locate_translation_files
```

Open localhost:8000/admin/mobetta/ to manage your translations.

# CHAPTER 5

---

Notes

---

## How Django loads your translation files

See the [django](#) translation docs

# CHAPTER 6

---

## Indices and tables

---

- genindex
- modindex
- search
