13 Library Structure	31
Python Module Index	37

nfsinkhole is a Python package for setting up a Linux server as a sinkhole (all protocols/ports to a secondary interface).

Summary

nfsinkhole is a Python library and scripts for setting up a Linux server as a sinkhole (monitor, log/capture, and drop all traffic to a secondary interface).

The default setup arguments monitor/capture all traffic. Setup arguments are provided to configure protocols, ports, rate limiting, logging, source IP/CIDR exclusions from logging, and optional packet capture.

All sinkhole events are written to `/var/log/nfsinkhole-events.log`. Optionally, you can enable `tcpdump` to output packet capture text to `/var/log/nfsinkhole-pcap.log` if your version of `tcpdump` supports packet printing; otherwise reverts to `/var/log/nfsinkhole.pcap`.

Warning: This version is considered experimental. Do not attempt to use this library in production until tests via travis and docker are setup, stable, and sufficiently covered.

Attention: You are responsible for rotating log files (`/var/log/nfsinkhole*`), and syslog forwarding must be configured manually (automation pending).

Features

- Simple install script
- Installs as a `init.d/systemctl` service
- Service modifies iptables on start/stop, no need to persist iptables
- rsyslog and syslog-ng supported
- RedHat/CentOS 6/7 tested

- Python 2.6+ and 3.3+ supported
- Built-in support for dealing with SELinux/AppArmor
- Packet capture of sinkhole traffic (printed output to log for tcpdump v4.5+)
- Useful set of utilities
- Detailed logging to /var/log/nfsinkhole-*
- Syslog forwarding configuration (pending)
- BSD license

Planned Improvements

- API/class documentation
- Tests via travis-ci/docker
- Exception handling overhaul
- Set logging level (currently debug)
- BIND/Microsoft/etc DNS server configuration documentation/examples
- Monitoring use case examples
- Automatic configuration for syslog forwarding
- SIEM parsers/apps/plugins
- Official support/testing for more OS environments
- Support handling exceptions for HIPS and other endpoint security products
- Intelligent handling/handshakes (inspired by iptrap - <https://github.com/jedisct1/iptrap>)

Documentation

Release v0.2.0

<https://nfsinkhole.readthedocs.io/en/v0.2.0>

GitHub master

<https://nfsinkhole.readthedocs.io/en/latest>

GitHub dev

<https://nfsinkhole.readthedocs.io/en/dev>

Examples

Pending

Github

<https://github.com/secynic/nfsinkhole>

Pypi

<https://pypi.python.org/pypi/nfsinkhole>

Changes

<https://nfsinkhole.readthedocs.io/en/latest/CHANGES.html>

Dependencies

OS:

```
iptables (likely already included in base OS)
tcpdump (optional - likely already included in base OS)
```

Python 2.6:

```
argparse
```

Python 2.7, 3.3+:

```
None!
```

Installing

Attention: The nfsinkhole service, iptables rules, and tcpdump must run as root. You can still use user/virtualenv Python environments, for the library, but ultimately, the core sinkhole will be run as root.

Note: Replace any below occurrence of <INTERFACE> with the name of your sinkhole network interface name.

Base OS (pip) – RECOMMENDED

If pip is not installed, you will first need to add the EPEL repo and install:

```
sudo yum install epel-release
sudo yum install python-pip
```

RHEL/CentOS 6/7

Basic:

```
pip install --user --upgrade nfsinkhole
python ~/.local/bin/nfsinkhole-setup.py --interface <INTERFACE> --install --pcap
```

virtualenv:

```
pip install virtualenv
virtualenv nfsinkhole
source nfsinkhole/bin/activate
nfsinkhole/bin/pip install nfsinkhole
nfsinkhole/bin/python nfsinkhole/bin/nfsinkhole-setup.py --interface <INTERFACE> --
↪install --pcap
```

Base OS (no pip)

RHEL/CentOS 6

GitHub - Stable:

```
wget -O argparse.tar.gz https://github.com/ThomasWaldmann/argparse/tarball/master
tar -C argparse -zxvf argparse.tar.gz
cd argparse
python setup.py install --user prefix=
cd ..
rm -Rf argparse
wget -O nfsinkhole.tar.gz https://github.com/secynic/nfsinkhole/tarball/master
tar -C nfsinkhole -zxvf nfsinkhole.tar.gz
cd nfsinkhole
python setup.py install --user prefix=
cd ..
rm -Rf nfsinkhole
python ~/.local/bin/nfsinkhole-setup.py --interface <INTERFACE> --install --pcap
```

RHEL/CentOS 7

GitHub - Stable:

```
wget -O nfsinkhole.tar.gz https://github.com/secynic/nfsinkhole/tarball/master
tar -C nfsinkhole -zxvf nfsinkhole.tar.gz
cd nfsinkhole
python setup.py install --user prefix=
cd ..
rm -Rf nfsinkhole
python ~/.local/bin/nfsinkhole-setup.py --interface <INTERFACE> --install --pcap
```

Service

Once installed you need to start the nfsinkhole service.

RHEL/CentOS 6

```
sudo service nfsinkhole start
```

RHEL/CentOS 7

```
sudo systemctl start nfsinkhole.service
```

API

AppArmor

AppArmor documentation:

<https://nfsinkhole.readthedocs.io/en/latest/apparmor.html>

iptables

iptables documentation:

<https://nfsinkhole.readthedocs.io/en/latest/iptables.html>

rsyslog

rsyslog documentation:

<https://nfsinkhole.readthedocs.io/en/latest/rsyslog.html>

SELinux

SELinux documentation:

<https://nfsinkhole.readthedocs.io/en/latest/selinux.html>

Service

Service (systemd/init.d) documentation:

<https://nfsinkhole.readthedocs.io/en/latest/service.html>

syslog-ng

syslog-ng documentation:

https://nfsinkhole.readthedocs.io/en/latest/syslog_ng.html

tcpdump

tcpdump documentation:

<https://nfsinkhole.readthedocs.io/en/latest/tcpdump.html>

Utilities

Utilities documentation:

<https://nfsinkhole.readthedocs.io/en/latest/utls.html>

Contributing

<https://nfsinkhole.readthedocs.io/en/latest/CONTRIBUTING.html>

Special Thanks

Thank you JetBrains for the [PyCharm](#) open source support!

Issue submission

Issues are tracked on GitHub:

<https://github.com/secynic/nfsinkhole/issues>

Follow the guidelines detailed in the appropriate section below. As a general rule of thumb, provide as much information as possible when submitting issues.

Bug reports

- Title should be a short, descriptive summary of the bug
- Include the OS, Python, and nfsinkhole versions affected
- Provide a context (with code example) in the description of your issue. What are you attempting to do?
- Include the full obfuscated output. Make sure to set DEBUG logging:

```
import logging
LOG_FORMAT = ('[%(asctime)s] [% (levelname)s] [% (filename)s: %(lineno)s] '
              ' [% (funcName)s()] %(message)s')
logging.basicConfig(level=logging.DEBUG, format=LOG_FORMAT)
```

- Include sources of information with links or screenshots
- Do you have a suggestion on how to fix the bug?

Feature Requests

- Title should be a short, descriptive summary of the feature requested

- Provide use case examples
- Include sources of information with links or screenshots
- Do you have a suggestion on how to implement the feature?

Testing

Testing code and infrastructure is in progress.

Questions

I am happy to answer any questions and provide assistance where possible. Please be clear and concise. Provide examples when possible. Check the [nfsinkhole documentation](#) and the [issue tracker](#) before asking a question.

Pull Requests

What to include

Aside from the core code changes, it is helpful to provide the following (where applicable):

- Unit tests
- Examples
- Sphinx configuration changes in /docs
- Requirements (python2.6.txt, etc)

Guidelines

- Title should be a short, descriptive summary of the changes
- Follow [PEP 8](#) where possible.
- Follow the [Google docstring style guide](#) for comments
- Must be compatible with Python 2.6, 2.7, and 3+
- Must not break OS compatibility for RHEL 6/7, CentOS 6/7
- Break out reusable code to functions
- Make your code easy to read and comment where necessary
- Reference the GitHub issue number in the description (e.g., Issue #01)
- When running nosetests, make sure to follow [Testing](#)

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT OWNER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

0.2.0 (TBD)

- Added syslog-ng support (#2)
- Added sudo arg to utils.popen_wrapper() - code consolidation
- Added loglevel argument to scripts and service.SystemService (#5). Defaults to info. Travis defaults to debug.
- Added Ubuntu/Debian docker tests to Travis
- Fixed bytes to str decoding issue on Python 3
- Fixed splitlines list[bytes] decode on Python 3
- Logging output tweaks
- Fixed redundant TCPDump.check_packet_print() in nfsinkhole-setup.py
- Fixed bytes-string comparison issues in Python 2 vs 3
- Fixed filepath checks in service.py
- Simplified utils.set_system_timezone(), removing unnecessary system calls.
- Python 3.6 support

0.1.0 (2016-08-29)

- Initial release

class `nfsinkhole.apparmor.AppArmor`

The class for managing apparmor policy enforcement, if it is installed.

disable_enforcement (*module*=*'usr/sbin.tcpdump'*)

The function for disabling AppArmor enforcement for a module.

Parameters *module* – Module in */etc/apparmor.d* to disable.

Returns True if disabling enforcement was successful, or False.

Return type Boolean

enable_enforcement (*module*=*'usr/sbin.tcpdump'*)

The function for enabling AppArmor enforcement for a module.

Parameters *module* – Module in */etc/apparmor.d* to enable.

Returns True if enabling enforcement was successful, or False.

Return type Boolean

exception `nfsinkhole.exceptions.BinaryNotFound`

An Exception for when a binary is not detected.

exception `nfsinkhole.exceptions.IPTablesError`

An Exception for when a iptables process generates stderr output.

exception `nfsinkhole.exceptions.IPTablesExists`

An Exception for when iptables rules, related to nfsinkhole, exist.

exception `nfsinkhole.exceptions.IPTablesNotExists`

An Exception for when iptables rules, related to nfsinkhole, don't exist.

exception `nfsinkhole.exceptions.SubprocessError`

An Exception for when a generic subprocess generates stderr output.

```
class nfsinkhole.iptables.IPTablesSinkhole (interface=None, interface_addr=None,
                                             log_prefix="[nfsinkhole] ", protocol='all',
                                             dport='0:65535', hashlimit='1/h', hashlimitmode='srcip, dstip, dstport', hashlimitburst='1', hashlimitexpire='1800000', srcexclude='127.0.0.1')
```

The class for managing sinkhole configuration within iptables.

Parameters

- **interface** – The secondary network interface dedicated to sinkhole traffic. Warning: Do not accidentally set this to your primary interface. It will drop all traffic, and kill your remote access.
- **interface_addr** – The IP address assigned to interface.
- **log_prefix** – Prefix for syslog messages.
- **protocol** – The protocol(s) to log (all traffic will still be dropped). Accepts a comma separated string of protocols (tcp,udp,udplite,icmp,esp,ah,sctp) or all.
- **dport** – The destination port(s) to log (for applicable protocols). Range should be in the format startport:endport or 0,1,2,3,n..
- **hashlimit** – Set the hashlimit rate. Hashlimit is used to tune the amount of events logged. See the iptables-extensions docs: <http://ipset.netfilter.org/iptables-extensions.man.html>
- **hashlimitmode** – Set the hashlimit mode, a comma separated string of options (srcip,srcport,dstip,dstport). More options here results in more logs generated.
- **hashlimitburst** – Maximum initial number of packets to match.
- **hashlimitexpire** – Number of milliseconds to keep entries in the hash table.
- **srcexclude** – Exclude a comma separated string of source IPs/CIDRs from logging.

create_drop_rule()

The function for writing the iptables DROP rule for the interface.

create_rules()

The function for writing iptables rules related to nfsinkhole.

delete_drop_rule()

The function for deleting the iptables DROP rule for the interface.

delete_rules()

The function for deleting iptables rules related to nfsinkhole.

list_existing_rules(filter_io_drop=False)

The function for retrieving current iptables rules related to nfsinkhole.

Parameters filter_io_drop – Boolean for only showing the DROP rules for INPUT and OUTPUT. These are not shown by default. This exists to avoid allowing packets on the interface if the service is down. If installed, the interface always drops all traffic regardless of the service state.

Returns Matching sinkhole lines returned by iptables -S.

Return type List

Raises `IPTablesError` – A Linux process had an error (stderr).

```
class nfsinkhole.rsyslog.RSyslog (is_systemd=False)
```

The class for managing rsyslog checks and configuration.

Parameters `is_systemd` – True if systemd is in use, False if not (use init.d).

create_config (*prefix*='[nfsinkhole] ')

The function for creating the rsyslog config.

Parameters `prefix` – The log prefix set in iptables.

delete_config ()

The function for deleting the rsyslog config.

get_version ()

The function for checking the rsyslog version.

Returns rsyslog version string if found, or None.

Return type String

restart ()

The function for restarting the rsyslog service.

selinux_associate ()

The function for associating the rsyslog config with selinux.

class `nfsinkhole.selinux.SELinux`

The class for managing selinux.

associate (*path*)

The function for associating a file path with selinux

class `nfsinkhole.service.SystemService` (*interface*=None, *interface_addr*=None,
log_prefix="[nfsinkhole] ", *protocol*='all',
dport='0:65535', *hashlimit*='1/h', *hashlimitmode*='srcip, dstip, dstport', *hashlimitburst*='1',
hashlimitexpire='1800000', *srcexclude*='127.0.0.1',
pcap=True, *loglevel*='info')

The class for managing the nfsinkhole init.d/systemd service.

Parameters

- **interface** – The secondary network interface dedicated to sinkhole traffic. Warning: Do not accidentally set this to your primary interface. It will drop all traffic, and kill your remote access.
- **interface_addr** – The IP address assigned to interface.
- **log_prefix** – Prefix for syslog messages.
- **protocol** – The protocol(s) to log (all traffic will still be dropped). Accepts a comma separated string of protocols (tcp,udp,udplite,icmp,esp,ah,sctp) or all.
- **dport** – The destination port(s) to log (for applicable protocols). Range should be in the format startport:endport or 0,1,2,3,n..
- **hashlimit** – Set the hashlimit rate. Hashlimit is used to tune the amount of events logged. See the iptables-extensions docs: <http://ipset.netfilter.org/iptables-extensions.man.html>
- **hashlimitmode** – Set the hashlimit mode, a comma separated string of options (srcip,srcport,dstip,dstport). More options here results in more logs generated.
- **hashlimitburst** – Maximum initial number of packets to match.
- **hashlimitexpire** – Number of milliseconds to keep entries in the hash table.
- **srcexclude** – Exclude a comma separated string of source IPs/CIDRs from logging.
- **pcap** – Enable packet capture text or raw depending on tcpdump version.

- **loglevel** – Logging level for nfsinkhole events. This does not affect sinkhole traffic logs, only service/library event logs. Must be one of debug, info, warning, error, critical.

check_systemd()

The function for checking if systemd is implemented.

Returns A tuple: is_systemd, svc_path.

Return type Tuple (Boolean, String)

create_service()

The function for creating the init.d/systemd service.

delete_service()

The function for deleting the init.d/systemd service.

class nfsinkhole.syslog_ng.**SyslogNG**(is_systemd=False)

The class for managing syslog-ng checks and configuration.

Parameters **is_systemd** – True if systemd is in use, False if not (init.d).

check_conf()

The function to check syslog-ng.conf for conf.d inclusion, and create the @include statement if missing. Will also create the conf.d directory, if missing.

create_config(prefix='[nfsinkhole] ')

The function for creating the syslog-ng config. (incomplete/unused)

Parameters **prefix** – The log prefix set in iptables.

delete_config()

The function for deleting the syslog-ng config.

get_version()

The function for checking the syslog-ng version.

Returns syslog-ng version string if found, or None.

Return type String

restart()

The function for restarting the syslog-ng service.

selinux_associate()

The function for associating the syslog-ng config with selinux.

class nfsinkhole.tcpdump.**TCPDump**(sbin='/usr/sbin/tcpdump')

The class for managing tcpdump checks.

Parameters **sbin** – Path to tcpdump binary

check_packet_print()

The function for checking if tcpdump/nflog support packet printing.

Returns True if packet printing is supported, or False.

Return type Boolean

get_version()

The function for checking the tcpdump version.

Returns tcpdump version string if found, or None.

Return type String

`nfsinkhole.utils.get_default_interface()`

The function for getting the default Linux network interface address.

Returns The network interface name, or None.

Return type String

`nfsinkhole.utils.get_interface_addr(interface=None)`

The function for automatically determining a Linux network interface address.

Parameters `interface` – The network interface name.

Returns The IP address for the interface, or None.

Return type String

`nfsinkhole.utils.popen_wrapper(cmd_arr=None, raise_err=False, log_stdout_line=True, sudo=False)`

The function for subprocess with custom logging output.

Parameters

- **cmd_arr** – Array of command strings to pass to subprocess.Popen().
- **raise_err** – If stderr is encountered, raise SubprocessError.
- **log_stdout_line** – If True, logs each stdout line as a separate log entry. If False, logs all of stdout in a single log entry.
- **sudo** – If True, prepends /usr/bin/sudo to cmd_arr. If False, cmd_arr is run as-is.

Returns stdout, stderr of the completed subprocess.

Return type Tuple

Raises

- `ValueError` – `cmd_arr` argument is not provided or is None.
- `TypeError` – `cmd_arr` argument is not a list.
- `SubprocessError` – The subprocess encountered an error (stderr). `raise_err` must be True for this.

`nfsinkhole.utils.set_system_timezone(timezone='UTC', skip_timedatectl=False)`

The function for setting the system timezone.

Parameters

- **timezone** – The timezone to set, see /usr/share/zoneinfo/* for options.
- **skip_timedatectl** – Skip attempting to set the timezone via timedatectl, mainly used for testing.

Raises `SubprocessError` – One of the processes associated with manual timezone configuration encountered an error.
