Nider is an approach to make generation of text based images simple yet flexible.

### Stable release

To install nider, run this command in your terminal:

```
$ pip install nider
```

This is the preferred method to install nider, as it will always install the most recent stable release.

If you don't have [pip](#) installed, this [Python installation guide](#) can guide you through the process.

### From sources

The sources for nider can be downloaded from the [Github repo](#).

You can either clone the public repository:

```
$ git clone git://github.com/pythad/nider
```

Or download the [tarball](#):

```
$ curl -OL https://github.com/pythad/nider/tarball/master
```

Once you have a copy of the source, you can install it with:

```
$ python setup.py install
```

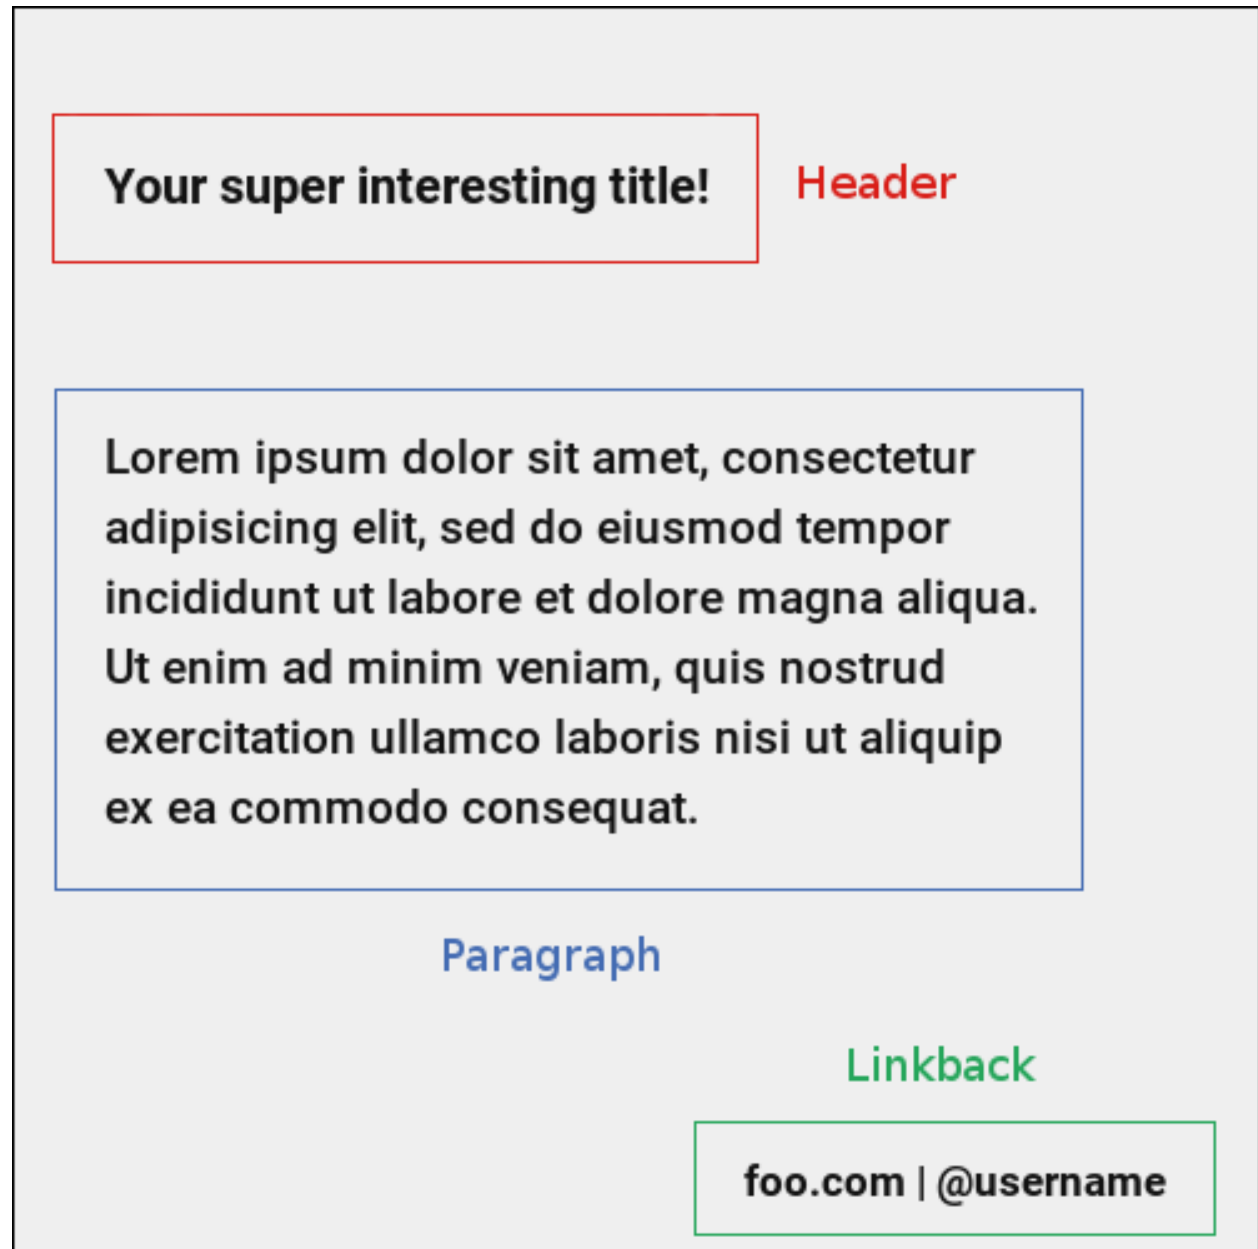

This article is a tutorial for `nider` package and at the same time it is a full reference of all `nider` models and possibilities.

## Image units

There are three main units each `nider.Image` can consist of:

- header
- paragraph
- linkback

Each of the units is represented by a class in `nider.models`:

- `nider.models.Header`
- `nider.models.Paragraph`
- `nider.models.Linkback`

### `nider.models.Header`

**class** `nider.models.Header`(*text*, *font=None*, *text\_width=21*, *line\_padding=6*, *color=None*, *outline=None*, *align='center'*)

Class that represents a header used in images

#### **Parameters**

- **text** (*str*) – text used for the unit.
- **font** (*nider.core.Font*) – font object that represents text’s font.
- **text\_width** (*int*) – unit’s text width - number of characters in a line.
- **line\_padding** (*int*) – unit’s line padding - padding (in pixels) between the lines.
- **color** (*str*) – string that represents a color. Must be compatible with [PIL.ImageColor color names](#).
- **outline** (*nider.core.Outline*) – outline object that represents text’s outline.
- **align** (*'left' or 'center' or 'right'*) – side with respect to which the text will be aligned.

#### Raises

- *nider.exceptions.InvalidAlignException* – if “align” is not supported by nider.
- *AttributeError* – if `text_width < 0`.
- *nider.exceptions.DefaultFontWarning* – if `font.path` is `None`.
- *nider.exceptions.FontNotFoundWarning* – if `font.path` does not exist.

#### Example

```
from nider.core import Font
from nider.core import Outline
from nider.models import Header

header = Header(text='Your super interesting title!',
                font=Font('/home/me/.local/share/fonts/Roboto/Roboto-Bold.ttf', 30),
                text_width=40,
                align='left',
                color='#ededed',
                outline=Outline(2, '#222')
                )
```

### nider.models.Paragraph

This class has the same attributes and behaviour as *nider.models.Header*.

```
class nider.models.Paragraph(text, font=None, text_width=21, line_padding=6, color=None,
                             line=None, align='center')
```

Class that represents a paragraph used in images

#### Parameters

- **text** (*str*) – text used for the unit.
- **font** (*nider.core.Font*) – font object that represents text’s font.
- **text\_width** (*int*) – unit’s text width - number of characters in a line.
- **line\_padding** (*int*) – unit’s line padding - padding (in pixels) between the lines.
- **color** (*str*) – string that represents a color. Must be compatible with [PIL.ImageColor color names](#).

- **outline** (`nider.core.Outline`) – outline object that represents text’s outline.
- **align** (`'left'` or `'center'` or `'right'`) – side with respect to which the text will be aligned.

#### Raises

- `nider.exceptions.InvalidAlignException` – if `“align”` is not supported by nider.
- `AttributeError` – if `text_width < 0`.
- `nider.exceptions.DefaultFontWarning` – if `font.path` is `None`.
- `nider.exceptions.FontNotFoundWarning` – if `font.path` does not exist.

#### Example

```
from nider.core import Font
from nider.core import Outline
from nider.models import Paragraph

para = Paragraph(text='Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed
↳do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
↳veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo
↳consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum
↳dolore eu fugiat nulla pariatur.',
                 font=Font('/home/me/.local/share/fonts/Roboto/Roboto-Bold.ttf', 30),
                 text_width=65,
                 align='left',
                 color='#ededed',
                 outline=Outline(1, '#000')
                 )
```

#### `nider.models.Linkback`

**class** `nider.models.Linkback` (`text`, `font=None`, `color=None`, `outline=None`, `align='right'`, `bottom_padding=20`)

Class that represents a linkback used in images

#### Parameters

- **text** (`str`) – text used for the unit.
- **font** (`nider.core.Font`) – font object that represents text’s font.
- **color** (`str`) – string that represents a color. Must be compatible with `PIL.ImageColor` color names
- **outline** (`nider.core.Outline`) – outline object that represents text’s outline.
- **align** (`'left'` or `'center'` or `'right'`) – side with respect to which the text will be aligned.
- **bottom\_padding** (`int`) – linkback’s bottom padding - padding (in pixels) between the bottom of the image and the linkback itself.

#### Raises

- `nider.exceptions.InvalidAlignException` – if `“align”` is not supported by nider.

- `nider.exceptions.DefaultFontWarning` – if `font.path` is `None`.
- `nider.exceptions.FontNotFoundWarning` – if `font.path` does not exist.

## Example

```
from nider.core import Font
from nider.core import Outline
from nider.models import Linkback

linkback = Linkback(text='foo.com | @username',
                    font=Font('/home/me/.local/share/fonts/Roboto/Roboto-Bold.ttf',
                               ↪30),
                    color='#ededed',
                    outline=Outline(2, '#000')
                    )
```

**Note:** Parameters `color` and `outline.color` are optional for any unit. They can be generated automatically by `nider`. `nider` analyzes background color of either a texture or of an image and chooses an opposite one to it. So if your image is mainly dark, white text color will be auto generated and set. The same applies to outline color.

Although it's a nice feature for backgrounds you have no control over, we'd recommend to provide colors explicitly.

## Image content

In order to aggregate all of the units together you need to create an instance of `nider.models.Content` class.

### `nider.models.Content`

**class** `nider.models.Content` (*paragraph=None, header=None, linkback=None, padding=45*)

Class that aggregates different units into a single object

#### Parameters

- **paragraph** (`nider.models.Paragraph`) – paragraph used for in the content.
- **header** (`nider.models.Header`) – header used for in the content.
- **linkback** (`nider.models.Linkback`) – linkback used for in the content.
- **padding** (*int*) – content's padding - padding (in pixels) between the units.

**Raises** `nider.exceptions.ImageGeneratorException` – if neither of `paragraph`, `header` or `linkback` is provided.

**Note:** `padding` is taken into account only if image is to get resized. If size allows content to fit freely, pre-calculated paddings will be used.

**Note:** Content has to consist at least of one unit: `header`, `paragraph` or `linkback`.

## Example

```
from nider.models import Content
from nider.models import Linkback
from nider.models import Paragraph

para = Paragraph(...)

linkback = Linkback(...)

content = Content(para, linkback=linkback, padding=60)
```

## Initializing an image

After the content is prepared it's the right time to initialize an image. In nider a basic image is represented by `nider.models.Image`.

### `nider.models.Image`

**class** `nider.models.Image` (*content, fullpath, width=1080, height=1080, title=None, description=None*)  
Base class for a text based image

#### Parameters

- **content** (`nider.models.Content`) – content object that has units to be rendered.
- **fullpath** (*str*) – path where the image has to be saved.
- **width** (*int*) – width of the image to be generated.
- **height** (*int*) – height of the image to be generated.
- **title** (*str*) – title of the image. Serves as metadata for latter rendering in html. May be used as alt text of the image. If no title is provided `content.header.text` will be set as the value.
- **description** (*str*) – description of the image. Serves as metadata for latter rendering in html. May be used as description text of the image. If no description is provided `content.paragraph.text` will be set as the value.

#### Raises

- `nider.exceptions.ImageGeneratorException` – if the current user has sufficient permissions to create the file at passed `fullpath`.
- `AttributeError` – if `width <= 0` or `height <= 0`.

## Example

```
from nider.models import Content
from nider.models import Image

content = Content(...)

img = Image(content,
            fullpath='example.png',
```

```
width=500,  
height=500  
)
```

## Social media images

nider comes with some pre-built models that can be used to generate images for some social networks. These are subclasses of `nider.models.Image` with changed size.

### Instagram

- `nider.models.InstagramSquarePost` - 1080x1080 image
- `nider.models.InstagramPortraitPost` - 1080x1350 image
- `nider.models.InstagramLandscapePost` - 1080x566 image

### Facebook

- `nider.models.FacebookSquarePost` - 470x470 image
- `nider.models.FacebookLandscapePost` - 1024x512 image

### Twitter

- `nider.models.TwitterPost` - 1024x512 image
- `nider.models.TwitterLargeCard` - 506x506 image

---

I highly recommend reading this [post](#) if you are curious about what are the right image sizes for social media images.

## Drawing on the image

Having an instance of `nider.models.Image` we are ready to create a real image.

nider comes with 3 options of drawing your image:

- `Image.draw_on_texture` - draws preinitialized image and its attributes on a texture.

---

**Note:** You don't need to create textured images by pasting texture multiple times in Photoshop or Gimp. nider takes care of filling image of any size with texture you provide.

---

- `Image.draw_on_bg` - Draws preinitialized image and its attributes on a colored background. nider uses a color you provide to fill the image and then draws the content.
- `Image.draw_on_image` - Draws preinitialized image and its attributes on an image. Content will be drawn directly on the image you provide.

## Image.draw\_on\_texture

`Image.draw_on_texture(texture_path=None)`

Draws preinitialized image and its attributes on a texture

If `texture_path` is set to `None`, random texture from `nider/textures` will be taken.

**Parameters** `texture_path` (*str*) – path of the texture to use.

**Raises**

- `FileNotFoundError` – if texture file at path `texture_path` cannot be found.
- `nider.exceptions.ImageSizeFixedWarning` – if the image size has to be adjusted to the provided content's size because the content takes too much space.

## Example

```
from nider.models import Content
from nider.models import Image

content = Content(...)

img = Image(content,
             fullpath='example.png',
             width=500,
             height=500
            )

img.draw_on_texture('example_texture.png')
```

Check the full example [here](#) .

---

nider comes with a [huge bundle of textures](#). As for now you need to copy them to your machine if you want to use any of them.

## Image.draw\_on\_bg

`Image.draw_on_bg(bgcolor=None)`

Draws preinitialized image and its attributes on a colored background

If `bgcolor` is set to `None`, random `nider.colors.colormap.FLAT_UI_COLORS` will be taken.

**Parameters** `bgcolor` (*str*) – string that represents a background color. Must be compatible with `PIL.ImageColor` color names

**Raises** `nider.exceptions.ImageSizeFixedWarning` – if the image size has to be adjusted to the provided content's size because the content takes too much space.

## Example

```
from nider.models import Content
from nider.models import Image

content = Content(...)
```

```
img = Image(content,
             fullpath='example.png',
             width=500,
             height=500
            )

img.draw_on_bg('#efefef')
```

Check the full example [here](#) .

## Image.draw\_on\_image

`Image.draw_on_image(image_path, image_enhancements=None, image_filters=None)`

Draws preinitialized image and its attributes on an image

### Parameters

- **image\_path** (*str*) – path of the image to draw on.
- **image\_enhancements** (*iterable*) – iterable of tuples, each containing a class from `PIL.ImageEnhance` that will be applied and factor - a floating point value controlling the enhancement. Check [documentation](#) of `PIL.ImageEnhance` for more info about available enhancements.
- **image\_filters** (*iterable*) – iterable of filters from `PIL.ImageFilter` that will be applied. Check [documentation](#) of `PIL.ImageFilter` for more info about available filters.

**Raises** `FileNotFoundError` – if image file at path `image_path` cannot be found.

## Examples

```
from nider.models import Content
from nider.models import Image

content = Content(...)

img = Image(content,
            fullpath='example.png',
            width=500,
            height=500
           )

img.draw_on_image('example_bg.jpg')
```

Using filters and enhancements:

```
img.draw_on_image('example_bg.jpg',
                 image_enhancements=((ImageEnhance.Contrast, 0.75),
                                     (ImageEnhance.Brightness, 0.5)),
                 image_filters=((ImageFilter.BLUR),),
                )
```

Check the full example [here](#) .

That's it. After any of draw methods has been called and successfully completed the new image will be saved to `Image.fullpath`.

### nider.core module

**class** `nider.core.Font` (*path=None, size=18*)  
Base class for text's font

#### Parameters

- **path** (*str*) – path to the font used in the object.
- **size** (*int*) – size of the font.

#### Raises

- `nider.exceptions.DefaultFontWarning` – if path is None.
- `nider.exceptions.FontNotFoundWarning` – if path does not exist.

**class** `nider.core.Outline` (*width=2, color=None*)  
Base class for text's outline

#### Parameters

- **width** (*int*) – width of the stroke.
- **color** (*str*) – string that represents outline color. Must be compatible with `PIL.ImageColor` color names.

**Warning:** Due to PIL limitations - core library used for drawing, nider doesn't support 'true' outline. That is why high width outlines will look rather ugly and we don't recommend using outlines with width > 3.

## nider.models module

**class** `nider.models.Header` (*text*, *font=None*, *text\_width=21*, *line\_padding=6*, *color=None*, *outline=None*, *align='center'*)

Class that represents a header used in images

### Parameters

- **text** (*str*) – text used for the unit.
- **font** (`nider.core.Font`) – font object that represents text’s font.
- **text\_width** (*int*) – unit’s text width - number of characters in a line.
- **line\_padding** (*int*) – unit’s line padding - padding (in pixels) between the lines.
- **color** (*str*) – string that represents a color. Must be compatible with `PIL.ImageColor` color names.
- **outline** (`nider.core.Outline`) – outline object that represents text’s outline.
- **align** (*'left' or 'center' or 'right'*) – side with respect to which the text will be aligned.

### Raises

- `nider.exceptions.InvalidAlignException` – if “align” is not supported by nider.
- `AttributeError` – if `text_width < 0`.
- `nider.exceptions.DefaultFontWarning` – if `font.path` is `None`.
- `nider.exceptions.FontNotFoundWarning` – if `font.path` does not exist.

**class** `nider.models.Paragraph` (*text*, *font=None*, *text\_width=21*, *line\_padding=6*, *color=None*, *outline=None*, *align='center'*)

Class that represents a paragraph used in images

### Parameters

- **text** (*str*) – text used for the unit.
- **font** (`nider.core.Font`) – font object that represents text’s font.
- **text\_width** (*int*) – unit’s text width - number of characters in a line.
- **line\_padding** (*int*) – unit’s line padding - padding (in pixels) between the lines.
- **color** (*str*) – string that represents a color. Must be compatible with `PIL.ImageColor` color names.
- **outline** (`nider.core.Outline`) – outline object that represents text’s outline.
- **align** (*'left' or 'center' or 'right'*) – side with respect to which the text will be aligned.

### Raises

- `nider.exceptions.InvalidAlignException` – if “align” is not supported by nider.
- `AttributeError` – if `text_width < 0`.
- `nider.exceptions.DefaultFontWarning` – if `font.path` is `None`.
- `nider.exceptions.FontNotFoundWarning` – if `font.path` does not exist.

**class** `nider.models.Linkback` (*text*, *font=None*, *color=None*, *outline=None*, *align='right'*, *bottom\_padding=20*)

Class that represents a linkback used in images

#### Parameters

- **text** (*str*) – text used for the unit.
- **font** (`nider.core.Font`) – font object that represents text's font.
- **color** (*str*) – string that represents a color. Must be compatible with `PIL.ImageColor` color names
- **outline** (`nider.core.Outline`) – outline object that represents text's outline.
- **align** (*'left' or 'center' or 'right'*) – side with respect to which the text will be aligned.
- **bottom\_padding** (*int*) – linkback's bottom padding - padding (in pixels) between the bottom of the image and the linkback itself.

#### Raises

- `nider.exceptions.InvalidAlignException` – if *align* is not supported by nider.
- `nider.exceptions.DefaultFontWarning` – if *font.path* is None.
- `nider.exceptions.FontNotFoundWarning` – if *font.path* does not exist.

**class** `nider.models.Content` (*paragraph=None*, *header=None*, *linkback=None*, *padding=45*)

Class that aggregates different units into a sigle object

#### Parameters

- **paragraph** (`nider.models.Paragraph`) – paragraph used for in the content.
- **header** (`nider.models.Header`) – header used for in the content.
- **linkback** (`nider.models.Linkback`) – linkback used for in the content.
- **padding** (*int*) – content's padding - padding (in pixels) between the units.

**Raises** `nider.exceptions.ImageGeneratorException` – if neither of *paragraph*, *header* or *linkback* is provided.

---

**Note:** *padding* is taken into account only if image is to get resized. If size allows content to fit freely, pre-calculated paddings will be used.

---

---

**Note:** Content has to consist at least of one unit: header, paragraph or linkback.

---

**class** `nider.models.Image` (*content*, *fullpath*, *width=1080*, *height=1080*, *title=None*, *description=None*)

Base class for a text based image

#### Parameters

- **content** (`nider.models.Content`) – content object that has units to be rendered.
- **fullpath** (*str*) – path where the image has to be saved.
- **width** (*int*) – width of the image to be generated.
- **height** (*int*) – height of the image to be generated.

- **title** (*str*) – title of the image. Serves as metadata for latter rendering in html. May be used as alt text of the image. If no title is provided `content.header.text` will be set as the value.
- **description** (*str*) – description of the image. Serves as metadata for latter rendering in html. May be used as description text of the image. If no description is provided `content.paragraph.text` will be set as the value.

**Raises**

- `nider.exceptions.ImageGeneratorException` – if the current user has sufficient permissions to create the file at passed `fullpath`.
- `AttributeError` – if `width <= 0` or `height <= 0`.

**draw\_on\_bg** (*bgcolor=None*)

Draws preinitialized image and its attributes on a colored background

If `bgcolor` is set to `None`, random `nider.colors.colormap.FLAT_UI_COLORS` will be taken.

**Parameters** **bgcolor** (*str*) – string that represents a background color. Must be compatible with `PIL.ImageColor` [color names](#)

**Raises** `nider.exceptions.ImageSizeFixedWarning` – if the image size has to be adjusted to the provided content's size because the content takes too much space.

**draw\_on\_image** (*image\_path, image\_enhancements=None, image\_filters=None*)

Draws preinitialized image and its attributes on an image

**Parameters**

- **image\_path** (*str*) – path of the image to draw on.
- **image\_enhancements** (*iterable*) – iterable of tuples, each containing a class from `PIL.ImageEnhance` that will be applied and factor - a floating point value controlling the enhancement. Check [documentation](#) of `PIL.ImageEnhance` for more info about available enhancements.
- **image\_filters** (*iterable*) – iterable of filters from `PIL.ImageFilter` that will be applied. Check [documentation](#) of `PIL.ImageFilter` for more info about available filters.

**Raises** `FileNotFoundError` – if image file at path `image_path` cannot be found.

**draw\_on\_texture** (*texture\_path=None*)

Draws preinitialized image and its attributes on a texture

If `texture_path` is set to `None`, random texture from `nider/textures` will be taken.

**Parameters** **texture\_path** (*str*) – path of the texture to use.

**Raises**

- `FileNotFoundError` – if texture file at path `texture_path` cannot be found.
- `nider.exceptions.ImageSizeFixedWarning` – if the image size has to be adjusted to the provided content's size because the content takes too much space.

**class** `nider.models.FacebookSquarePost` (*\*args, \*\*kwargs*)

Alias of `nider.models.Image` with `width=470` and `height=470`

**class** `nider.models.FacebookLandscapePost` (*\*args, \*\*kwargs*)

Alias of `nider.models.Image` with `width=1024` and `height=512`

```
nider.models.TwitterPost
    alias of FacebookLandscapePost

class nider.models.TwitterLargeCard (*args, **kwargs)
    Alias of nider.models.Image with width=506 and height=506

class nider.models.InstagramSquarePost (*args, **kwargs)
    Alias of nider.models.Image with width=1080 and height=1080

class nider.models.InstagramPortraitPost (*args, **kwargs)
    Alias of nider.models.Image with width=1080 and height=1350

class nider.models.InstagramLandscapePost (*args, **kwargs)
    Alias of nider.models.Image with width=1080 and height=566
```

## nider.exceptions module

```
exception nider.exceptions.AutoGeneratedUnitColorUsedWarning (unit, color_used)
    Warning raised when auto generated unit color was used

exception nider.exceptions.AutoGeneratedUnitOutlinecolorUsedWarning (unit,
                                                                    color_used)
    Warning raised when auto generated unit's outline color was used

exception nider.exceptions.DefaultFontWarning
    Warning raised when default font was used

exception nider.exceptions.FontNotFoundWarning (fontpath_provided)
    Warning raised when font cannot be found

exception nider.exceptions.ImageGeneratorException
    Base class for exceptions raised by nider

exception nider.exceptions.ImageGeneratorWarning
    Base class for warnings raised by nider

exception nider.exceptions.ImageSizeFixedWarning
    Warning raised when the size of the image has to be adjusted to the provided content's size because the content
    takes much space

exception nider.exceptions.InvalidAlignException (align_provided, available_aligns=None)
    Exception raised when align is not supported by nider
```

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

### Types of Contributions

#### Report Bugs

Report bugs at <https://github.com/pythad/nider/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

#### Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” and “help wanted” is open to whoever wants to implement it.

#### Implement Features

Look through the GitHub issues for features. Anything tagged with “enhancement” and “help wanted” is open to whoever wants to implement it.

## Write Documentation

nider could always use more documentation, whether as part of the official nider docs, in docstrings, or even on the web in blog posts, articles, and such.

## Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/pythad/nider/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## Get Started!

Ready to contribute? Here's how to set up *nider* for local development.

1. Fork the *nider* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/nider.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv nider
$ cd nider/
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass flake8 and the tests, including testing other Python versions with tox:

```
$ flake8 nider tests
$ python setup.py test or py.test
$ tox
```

To get flake8 and tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 3.4 and 3.5. Check [https://travis-ci.org/pythad/nider/pull\\_requests](https://travis-ci.org/pythad/nider/pull_requests) and make sure that the tests pass for all supported Python versions.

## Tips

To run a subset of tests:

```
$ python -m unittest discover tests
```

## CHAPTER 5

---

Credits

---

### Development Lead

- Vladyslav Ovchynnykov <[ovd4mail@gmail.com](mailto:ovd4mail@gmail.com)>

### Contributors

None yet. Why not be the first?

#### 0.1.0 (2017-07-27)

- First release on PyPI.

#### 0.2.0 (2017-08-12)

- Added `PIL.ImageEnhance` and `PIL.ImageFilter` built-in support
- Enabled auto color generation for unit colors

#### 0.3.0 (2017-08-17)

- Dropped shadow support for units
- Added outline support for units
- Made unit's font config as a separate class

## CHAPTER 7
