# **Novius OS Documentation**

***Release 5.0.1 (Elche)***

**Novius**

September 17, 2015

<b>1</b>	<b>Summary</b>	<b>3</b>
1.1	PHP API . . . . .	3
1.2	Javascript API . . . . .	126
1.3	Applications . . . . .	142
<b>PHP Namespace Index</b>		<b>155</b>

Welcome to Novius OS API documentation. It is hosted and generated by [Read The Docs](#).

All contributions are welcome: Reporting or fixing errors or submitting improvements.

Sources are on [GitHub](#), we look forward to your Pull Request. Contact us if you need help with your contribution.

## Summary

---

## 1.1 PHP API

### 1.1.1 Novius OS configuration

#### Multi-Contexts

#### Configuration

To change the contexts of your Novius OS instance, edit the `local/config/contexts.config.php` file.

**Default configuration** After installation, Novius OS is configured with three contexts, one site in three languages:

```
<?php
return array(
    'sites' => array(
        'main' => array(
            'title' => 'Main site',
            'alias' => 'Main',
        ),
    ),
    'locales' => array(
        'fr_FR' => array(
            'title' => 'Français',
            'flag' => 'fr',
        ),
        'en_GB' => array(
            'title' => 'English',
            'flag' => 'gb',
        ),
        'ja_JP' => array(
            'title' => '',
            'flag' => 'jp',
        ),
    ),
    'contexts' => array(
        'main::en_GB' => array(),
        'main::fr_FR' => array(),
    )
);
```

```

        'main::ja_JP' => array(),
),
);

```

**Multi-sites / multi-languages** Here is an example configuration with five contexts across three sites and three languages:

```

<?php
return array(
    'sites' => array(
        'main' => array(
            'title' => 'Main site',
            'alias' => 'main',
        ),
        'mobile' => array(
            'title' => 'Mobile site',
            'alias' => 'Mobile',
        ),
        'event' => array(
            'title' => 'Event site',
            'alias' => 'Event',
        ),
    ),
    'locales' => array(
        'en_GB' => array(
            'title' => 'English',
            'flag' => 'gb',
        ),
        'fr_FR' => array(
            'title' => 'Français',
            'flag' => 'fr',
        ),
        'es_ES' => array(
            'title' => 'Español',
            'flag' => 'es',
        ),
    ),
    'contexts' => array(
        'main::en_GB' => array(),
        'main::fr_FR' => array(),
        'main::es_ES' => array(),
        'mobile::fr_FR' => array(),
        'event::en_GB' => array(),
    ),
);

```

**One site in one language** Here is an example configuration for just one site in one language:

```

<?php
return array(
    'sites' => array(
        'main' => array(
            'title' => 'Main site',
            'alias' => 'main',
        ),
    ),
);

```

```

        ),
    ),

    'locales' => array(
        'en_GB' => array(
            'title' => 'English',
            'flag' => 'gb',
        ),
    ),
),

'contexts' => array(
    'main::en_GB' => array(),
),
);

```

## Domain Names

By default, the first context will answer to the root of your domain, the following contexts in a site\_code/language\_code/ subdirectory (e.g.: main/es\_ES/).

But for each context, you can choose the URI (including a domain and optionally a directory) it will answer to, by specifying it the the associated configuration array.

## Contexts on subdirectory

```

<?php

'contexts' => array(
    'main::en_GB' => array(), // Uses the default domain
    'main::fr_FR' => array(
        'http://www.mysite.com/fr/',
    ),
    'main::es_ES' => array(
        'http://www.mysite.com/es/',
    ),
    'mobile::fr_FR' => array(
        'http://www.mysite.com/mobile/',
    ),
    'event::en_GB' => array(
        'http://www.mysite.com/event/',
    ),
),

```

**Warning:** If your main context (the first) has a fr/example.html page and your main::fr\_FR context has an example.html page, their URLs are identical (ie: http://www.mysite.com/fr/example.html). In this situation, only the page of your main context will be accessible.

## Contexts on domains

```

<?php

'contexts' => array(
    'main::en_GB' => array(
        'http://www.monsite.com/',
    ),
)

```

```
'main::fr_FR' => array(
    'http://www.mysite.fr/',
),
'main::es_ES' => array(
    'http://www.monsite.es/',
),
'mobile::fr_FR' => array(
    'http://mobile.monsite.fr/',
),
'event::en_GB' => array(
    'http://event.monsite.com/',
),
),
```

---

**Note:** Of course, your domains should also be properly configured in **Apache**.

---

### Contexts with multiple URLs

```
<?php
'contexts' => array(
    'main::en_GB' => array(
        'http://www.monsite.com/',
),
    'main::fr_FR' => array(
        'http://www.mysite.fr/',
),
    'main::es_ES' => array(
        'http://www.monsite.es/',
),
    'mobile::fr_FR' => array(
        'http://mobile.monsite.fr/',
        'http://www.monsite-mobile.fr/',
        'http://www.mysite.com/mobile/',
),
    'event::en_GB' => array(
        'http://event.monsite.en/',
),
),
```

### Going live

You will probably need to define, for each of your contexts, different URLs between your local (development) and production instances. You can do that using *environment-specific config files*.

### Novius OS

A sample configuration file is available in `local/config/config.php.sample`. Just rename (or copy) it to `local/config/config.php`, and update it to your case.

#### cache

Boolean for use of cache on front. By default is `true`, except in DEVELOPMENT environment.

New in version 0.2.0.2.

**cache\_duration\_page**

Int, number of seconds of cache validity. By default is 60.

**cache\_model\_properties**

Boolean for use of cache on [Nos\Orm\Model](#) properties. By default is false. If is true, all models properties will be cached with a auto-refresh mechanism : if you add a column on a model which has properties defined, the cache will be refreshed by a DB list\_columns request when you access this column with get() or set().

New in version Chiba: 1.0.1

**upload**

Array :

**Parameters**

- **disabled\_extensions** – Array of invalid extensions for files uploaded in Novius OS. By default php is disabled.

**assets\_minified**

Boolean for use of assets minified in back-office. By default is true, except in DEVELOPMENT environment.

**temp\_dir**

Path of a temp directory. Set to local/data/temp by default.

## Database

The DB configuration was initially created by the installation wizard. But you can (and you must to go live) update it after installation.

The DB configuration is in local/config/db.php.

**See also:**

[FuelPHP Database documentation](#) for details.

## Email

By default, your Novius OS is not configured to send mail, because it's too dependent on the server.

A sample configuration file is available in local/config/email.config.php.sample. Just rename (or copy) it to local/config/email.config.php, and update it to your case.

**See also:**

[FuelPHP email package documentation](#) for details.

## WYSIWYG

You can modify default configuration of WYSIWYGS in your Novius OS. You can also have multiple configurations, especially configurations for contexts.

A sample configuration file is available in local/config/wysiwyg.config.php.sample. Just rename (or copy) it to local/config/wysiwyg.config.php, and update it to your case.

To set a configuration for a context, set a key with the context id in the array setups:

```
<?php
return array(
    'default' => array(
        ),
        'active_setup' => 'default',
        'setups' => array(
            'default' => array(),
            'main::en_GB' => array(
                //... Set here your specific configuration for context main::en_GB
            ),
            //'main::fr_FR' => array(),
            //'main::ja_JP' => array(),
        ),
);
);
```

**See also:**

TinyMCE documentation for details.

## Friendly slug

All segments of URLs builded in Novius OS are cleaned by the friendly slug mechanism.

A sample configuration file is available in `local/config/friendly_slug.config.php.sample`. Just rename (or copy) it to `local/config/friendly_slug.config.php`, and update it to your case.

**active\_setup** The active setup key. This key must be present in `setups`. Execute in all case. Default value: `default`.

**setups** Array of different setups.

In `setups`, key can be a context ID. In this case, this setup is execute for slugs in this context.

Four setups of rules are defined:

- `default` setup. All characters ?, :, \, /, #, [ , ], @, & and space are replaced by -. Transform to lower case. Remove trailing -. Replace multiple - by one.
- `no_accent` setup. All accent characters are replaced by the equivalent character without accent.
- `no_special` setup. All characters that are not a word character, a - or a \_ are replaced by -.
- `no_accent_and_special` setup. Combination of `no_accent` and `no_special` setups.

A setup value is an array. This array can contain :

- an other setup ID
- A `key => value`, in this case, all occurrence of `key` in the slug are replaced by `value`.
- Value can be also an array, with a `key replacement` and a `key flags` for the regular expression.

Sample:

```
<?php
return array(
    'setups' => array(
        'my_default' => array(
            // Use the 'no_accent' setup
            'no_accent',
        ),
    ),
);
```

```
// Replace space by '_'
' ' => '_',

// All characters that are not a word character, a '-' or a '_' or a '*' are replaced by
'[^\\w\\*\\-_]' => array('replacement' => '-', 'flags' => 'i'),
),
),
);
;
```

## 1.1.2 Application configuration

### PHP to Javascript

Application configuration is mostly done in PHP, but a lot of code also runs in the browser, and is powered by JavaScript.

Some PHP configuration patterns have been created to define JavaScript behaviours from a PHP configuration file.

### PHP nosActions

`$container.nosAction()` executes an action bound to a DOM element.

To define an action in PHP:

```
<?php
'action' => array(
    'action' => 'actionName', // nosTabs, nosDialog, confirmationDialog, nosAjax, window.open, do
    // Other keys are array and depends on the actionName
),

// Example with nostabs
'action' => array(
    'action' => 'nosTabs',
    'tab' => array(
        'url' => 'admin/nos/page/page/insert_update/{{id}}',
        'label' => '{{title}}',
    ),
),
);
```

This syntax is used to define actions for:

- *Launchers*
- *Data catchers*
- buttons and menus in the Appdesk
- Crud Controller

### PHP cellFormatters

Used to format the value displayed in a column of a grid in the Appdesk.

A `cellFormatter` is an associative array.

You can have multiple `cellFormatter`, just use arrays.

You can assign a key to a `cellFormatter`. This way, someone else can delete or modify it by overloading configuration.

### Common keys

**type** The `cellFormatter` type. Can one of `bold`, `css`, `icon`, `iconClasses` or `link`.

**replace** If `true`, `cellFormatter` empties the current content.

**ignore** Column name to check if we should ignore this `cellFormatter` for the current item. If '`1`' (the string containing the digit 1), the `cellFormatter` will be ignored for this item.

### Types

**bold** Formats the text in bold. No additional key.

**css** Apply CSS styles to the content.

`css` An associative array of all CSS styles to apply.

```
<?php
array(
    'type' => 'css',
    'css' => array(
        'text-align' => 'center',
    ),
),
```

**icon** Prepends an icon to the text, using an URL.

**column** Use a `data_mapping` column to fetch the icon URL.

**src** The icon URL.

**mapping** A mapping array to fetch URL depending on the value of the column.

**size** Force a size in pixels for the icon. Used for both width and height.

```
<?php
array(
    'type' => 'icon',
    'column' => 'column_icon', // URL is retrieved from the 'column_icon' column
    'size' => 16
),
// Or
array(
    'type' => 'icon',
    'src' => 'static/path/icon.png',
),
// Or
array(
    'type' => 'icon',
    'mapping' => array(
        '1' => 'static/path/icon-1.png', // If column value is '1', use this URL
        '2' => 'static/path/icon-2.png',
)
```

```
) ,  
) ,
```

**iconClasses** Prepends an icon to the text, using CSS classes.

**column** Use a `data_mapping` column to fetch the icon CSS classes.

**classes** The icon CSS classes.

```
<?php  
array(  
    'type' => 'iconClasses',  
    'column' => 'column_icon_classes', // CSS classes are fetch from the 'column_icon_classes' column  
) ,  
  
// Or  
array(  
    'type' => 'iconClasses',  
    'classes' => 'icon icon-foo',  
) ,
```

**link** Wraps a link to the text (which performs an action upon click).

**action** Action to perform when the link is clicked. Can be `default` to use the default action of the item, an `action name` of the item or a `nosAction`.

```
<?php  
array(  
    'type' => 'link',  
    'action' => 'default', // Binds the default action (e.g.: 'edit the item' in the most of the cases)  
) ,  
  
// Or  
array(  
    'type' => 'link',  
    'action' => 'Namespace\Model_Example.result', // Binds the 'result' action of the item, which is defined in the Model_Example class  
) ,  
  
// Or  
array(  
    'type' => 'link',  
    'action' => array(  
        'action' => 'nosTabs', // Open a new tab  
        'tab' => array(  
            'url' => 'admin/nos/page/page/insert_update/{{_id}}', // {{_id}} will be replaced by the item's id  
            'label' => '{{_title}}', // {{_title}} will be replaced by the item's title  
        ),  
    ),  
) ,
```

**Custom cellFormatters** It is possible to create custom `cellFormatters`. You just have to indicate your javascript url in the `type` key.

Here is a `cellFormatter` sample allowing you to change the font size of a column.

```
define(function(require, exports) {
    exports.format = function(formatter, args) {
        args.$container.css({
            'font-size': 20
        });
    }
});
```

## Full example

```
<?php
'data_mapping' => array(
    'column_a' => array(
        'title' => 'Column a',
        'cellFormatters' => array(
            'bold' => array(
                'type' => 'bold',
            ),
            'center' => array(
                'type' => 'css',
                'css' => array(
                    'text-align' => 'center',
                ),
            ),
        ),
    ),
    'column_b' => array(
        'title' => 'Column b',
        'cellFormatters' => array(
            'icon' => array(
                'type' => 'icon',
                'column' => 'column_icon',
                'size' => 16
            ),
        ),
    ),
    'column_icon' => array(
        value => function($item) {
            return $item->icon();
        },
    ),
),
```

## Metadata

The `metadata.config.php` file is how an application is defined. It tells what contains the application and what it does.

The most important keys are:

**name** The name of the application.

**namespace** In which PHP namespace all the classes of the application must be defined.

**icons** In the 3 standard sizes 16\*16, 32\*32 and 64\*64.

**requires** Optional. Which applications does your application requires. Array or string (in the last case, considered as an array with a unique element).

**extends** Optional. Application can extend other applications. Extend mechanism can extended config file, lang file and views.

```
<?php

return array(
    'name'      => 'Webpages',
    'namespace' => 'Nos\Page',
    'version'   => '0.2',
    'provider'  => array(
        'name'  => 'Novius OS',
    ),
    'extends'   => array(
        // Optional,
    ),
    'requires'  => array(
        // Optional
    ),
    'icons'     => array(
        64 => 'static/apps/noviusos_page/img/64/page.png',
        32 => 'static/apps/noviusos_page/img/32/page.png',
        16 => 'static/apps/noviusos_page/img/16/page.png',
    ),
    'permission'=> array(
        // Empty array for now. Leave it.
    ),
    'i18n_file' => 'noviusos_page::metadata',
    'launchers' => array(
        // Optional
    ),
    'enhancers' => array(
        // Optional
    ),
    'templates' => array(
        // Optional
    ),
    'data_catchers' => array(
        // Optional
    ),
);
)
```

An application provides:

## Extends

An application can extend multiple others applications.

An application that extends an other application will be loaded when the extended application is loaded.

Configuration and language files of an extended application can be extended by an application that extends. Views can be replaced.

To proceed, put extended files in subdirectory apps/application\_extended.

**Example:** the app\_a application extends app\_b application, especially config/common.config.php, lang/common.lang.php and views/common.view.php.

Files structure will be:

- local/applications/app\_a/
  - config/apps/app\_b/common.config.php
  - lang/apps/app\_b/common.lang.php
  - views/apps/app\_b/common.view.php

### Launchers

A *launcher* is an icon on the home tab.

A launcher is defined by an associative array. Key is launcher ID, launcher properties is an associative array:

- name** Text to display for the icon.
- icon** Optional. URL to a 64\*64 image, default will use the 64\*64 icon of the app.
- action** What is done when clicking on the launcher. See [PHP nosActions](#).

```
<?php

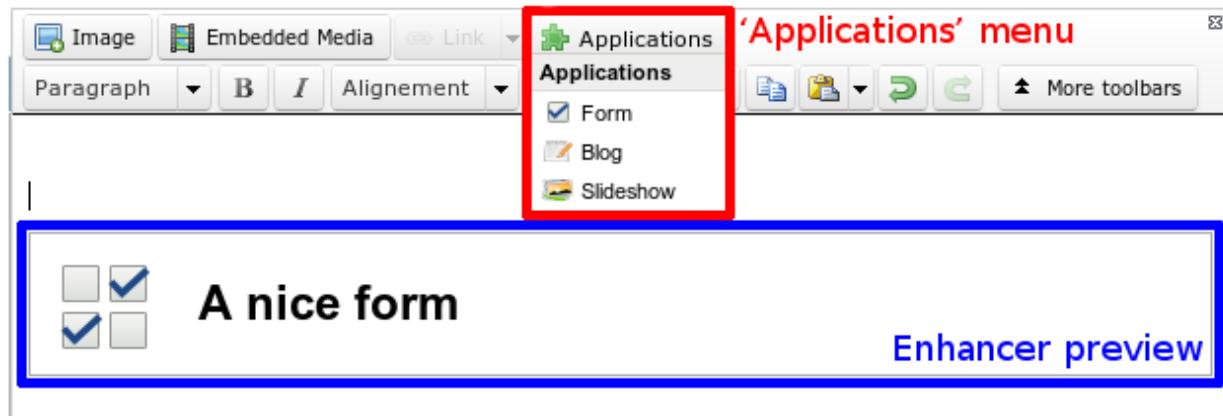

return array(
    'launchers' => array(
        'noviusos_page' => array(
            'name' => 'Webpages',
            // 'icon' is not set, so the default icon will be used
            'action' => array(
                // open a tab
                'action' => 'nosTabs',
                'tab' => array(
                    'url' => 'admin/noviusos_page/appdesk/index',
                    // 'iconUrl' is not set, so the default icon will be used
                ),
            ),
        ),
    ),
);
```

### Enhancers

*Enhancers* are used in WYSIWYG editors. They provide functionalities for the front-office.

For example, the ‘Forms’ application allows users to insert forms in their web pages (using an enhancer).

*URL enhancers*, a specific type of enhancers, handle their own URLs. For example, every blog post has an URL.

An enhancer is defined with:

**title** Title of the enhancer displayed when opening the ‘Application’ menu from the wysiwyg.

**desc** Optional. Description of the enhancer.

**iconUrl** Optional. URL to a 16\*16 icon, displayed when opening the ‘Application’ menu from the wysiwyg, default will use the 16\*16 icon of the app ;

**enhancer** URL of the front-office controller used to render the enhancer.

**urlEnhancer** Same that `enhancer`. Only one of the two keys can be used, depending if you want an URL enhancer or just a plain regular enhancer.

**previewUrl** Optional. URL of the controller used to render the preview in the wysiwyg.

**dialog** Optional. If you want a configuration popup, URL of the controller used to display and save the enhancer configuration. See `$container->nosDialog()` for the list of parameters.

#### valid\_container

Optional. A `callback function` to check if the enhancer is available for a specific container.

If the function returns false, the enhancer won’t be available.

The function takes two parameters: the enhancer’s configuration and the `container instance`.

```
<?php

return array(
    'noviusos_form' => array(
        'title' => 'Form',
        'desc' => '',
        // Here it's just a regular enhancer
        'enhancer' => 'noviusos_form/front/main',
        // 'urlEnhancer' => 'noviusos_form/front/main',
        'iconUrl' => 'static/apps/noviusos_form/img/icons/form-16.png',
        // We'll use our controller to generate the preview
        'previewUrl' => 'admin/noviusos_form/enhancer/preview',
        // And the user has to configure it
        'dialog' => array(
            'contentUrl' => 'admin/noviusos_form/enhancer/popup',
            'width' => 450,
            'height' => 400,
            'ajax' => true,
        ),
        // The callback function which check availability of the enhancer
    ),
);
```

```
'valid_container' => 'validContainer',
),
);

// In this example, the enhancer won't be available in WYSIWYGS of monkeys.
function validContainer($enhancer, $container)
{
    $container_class = get_class($container);
    return $container_class !== 'Nos\Monkey\Model_Monkey';
}
```

## Templates

*Templates* are similar to other CMS' templates or themes. They provide a layout for the front-office.

In Novius OS, a template contains one or more WYSIWYG editable area(s), which are placed inside a grid.

The grid has a size of `cols * rows`, and each editable area is positioned using absolute coordinates (it's similar to `position: absolute` in CSS).

Each WYSIWYG editable area has:

- a **name**: it's the key in the `layout` array (see below) ;
- a **position**: absolute coordinates inside the grid (similar to `left` and `top` in CSS) ;
- a **size**: similar to `width` and `height` in CSS.

In the end, a template is defined with:

**file** path to the template file (it's a view)  
**title** title of the template, it's shown when selecting a template for a page  
**cols** grid width (in units)  
**rows** grid height (in units)  
**layout** list of the WYSIWYG editors inside the grid :

- the key is the name of the WYSIWYG ;
- the value is a comma-separated string containing (in this order) :
  - the left position (0-indexed) ;
  - the top position (0-indexed) ;
  - the width (in units) ;
  - the height (in units).

**screenshot** Optional. URL of the image representing the template.

Here's an example:

```
<?php

return array(
    'templates' => array(
        'top_menu' => array(
            'file' => 'noviusos_templates_basic::top_menu',
            'title' => 'Default template with a top menu',
            'cols' => 1,
```

```

    'rows' => 1,
    'layout' => array(
        // There is one WYSIWYG named 'content'
        // Position inside the grid: <left>, <top>, <width>, <height>
        'content' => '0,0,1,1',
    ),
),
),
);

```

Templates are not used directly in Novius OS. Template variations by context is used.

#### See also:

*Template variation*

### Data catchers

#### Common

Configuration for `Nos\Orm\Model`, used in Appdesk, Crud Controller or Inspectors.

Associative array:

- data\_mapping** columns on Appdesk and Inspectors.
- i18n** Optional, common translation
- actions** Optional, common actions on the `Nos\Orm\Model`.
- icons** Optional, common icons related to the `Nos\Orm\Model`.

### Data mapping

Associative array where each key => value defines a column, all keys are optionals.

- title** Title of the grid column. If not set, column will not be displayed.
- column** Default value is same as key.
- search\_column** Default value is column key value. Defines on which SQL column search / order.
- search\_relation** Default value is deduced from key (ex: `rel->col`). Relation to load (via related function on query).
- sorting\_callback** A closure function taking two parameters: the `$query` object and the `$sortDirection`.
- multiContextHide** Hide grid column when items are filtered on more than one contexts.
- isSafeHtml** If `true`, the content won't be escaped when displayed (inside the grid).
- value** A closure function taking current item `Nos\Orm\Model` in first parameter. Overloads value displayed in the grid.
- cellFormatters** Associative array of `cellFormatters` for formatting column display.
- preview\_url** allow to custom url of the current item (used through “visualise” action).
  - method** A callback taking current item as paramter.
  - value** Simple string value corresponding to the URL of the item.

```
<?php
return array(
    'data_mapping' => array(
        'column_a' => array(
            'title' => 'Column A',
            'column' => 'col_a',
            'multiContextHide' => true,
            'cellFormatters' => array(
                'center' => array(
                    'type' => 'css',
                    'css' => array('text-align' => 'center'),
                ),
            ),
        ),
        'column_b' => array(
            'title' => 'B',
            'search_column' => 'col_b_search',
            'search_relation' => 'rel',
            'value' => function($item) {
                return 'test';
            },
        ),
        // ...
    ),
);
```

**Particular cases** In the following example, column\_a is sent in json but is not displayed in the grid.

```
<?php
return array(
    'data_mapping' => array(
        'column_a',
    ),
);
```

In the following example, col\_b is sent in json under the column\_b key but is not displayed in the grid.

```
<?php
return array(
    'data_mapping' => array(
        'column_b' => 'col_b',
    ),
);
```

If the Model has the `Orm_Behaviour_Twinnable` behaviour, a pseudo column `context` is automatically added at the end of the `data_mapping`. But, if you want to place it elsewhere, you can force its position like this:

```
<?php
return array(
    'data_mapping' => array(
        'column_a' => array(
            'title' => 'Column a'
        ),
        'context',
        'column_b' => array(
            'title' => 'Column b'
        ),
    ),
);
```

```
// ...
);
```

## I18n

This key contains all the common translations.

```
<?php
return array(
    'i18n' => array(
        // Crud
        'notification item added' => ___('Done! The item has been added.'),
        'notification item saved' => ___('OK, all changes are saved.'),
        'notification item deleted' => ___('The item has been deleted.'),

        // General errors
        'notification item does not exist anymore' => ___('This item doesn't exist any more. It has been deleted.'),
        'notification item not found' => ___('We cannot find this item.'),

        // ... see the 'framework/config/i18n_common.config.php' file to include the appropriate keys
    ),
);
```

## Actions

This key contains all the common actions related to the model. 5 actions are automatically added:

- add** The *Add model* button located on the appdesk's toolbar
- edit** The *Edit* button located on the grids and the crud's toolbar
- delete** The *Delete* button located on the grids and the crud's toolbar
- visualise** The *Visualise* button located on the grids and crud's toolbar, if the item can be displayed in front-office.
- share** The *Share* button located on the crud's toolbar, if the item has the *Nos\Orm\_Behaviour\_Sharable* behaviour.

The action key can be filled in two different ways.

The most common way is to use an associative array:

```
<?php
return array(
    // ...
    'actions' => array(
        'action_1' => array(/* configuration */),
        'action_2' => array(/* configuration */),
        // ...
    ),
);
```

If you want to change the order in which the actions are displayed, two keys are to be defined:

- list** associative array of actions (similar to the previous *actions* key)
- order** array of action's key defining their order

```
<?php
return array(
    // ...
    'actions' => array(
        'list' => array(
            'action_1' => array(/* configuration */),
            'action_2' => array(/* configuration */),
            // ...
        ),
        'order' => array(
            'action_2',
            'action_1'
        ),
    ),
);
;
```

Each action is an associative array. Key is the action ID, and value is an array defining the action configuration:

**action** which action is executed when clicking on the button (using `nosAction`).

**label** Text associated with the action (either shown as text or in a tooltip).

**primary** Is it a primary action? Primary actions have a dedicated button, and secondary actions appears in the action drop down.

**icon** Icon of the action. It's a `jquery ui icon` class, but without the leading `ui-icon-` string.

**red** Is it a red action? (especially used for 'Delete')

**align** Alignment of the button. Can be a string (`begin` or `end`) or a number (`begin` is equivalent to `-10` and `end` is equivalent to `10`). Defines actions default order (`align` in ascending order).

**targets** Where is the action displayed? This has no effect if the action is not visible (see below).  
There are 3 locations available:

**grid** Is the action displayed on the grid (appdesk and inspector)?

**toolbar-grid** Is the action displayed on the grid's toolbar?

**toolbar-edit** Is the action displayed on the crud's toolbar (edition form)?

**disabled** Callback function or array of callback functions (the one taken into account is the first which doesn't return `false`) that returns a boolean or a string defining if the action is disabled or not for an item (a string disable the action and the value is used as title). There is two sent parameters: the current `$item`, and `$params` containing the common configuration.

**visible** Callback function or array of callback functions (the one taken into account is the first which doesn't return `true`) that returns a boolean defining if the action is visible or not on a context.  
There is only one parameter sent, an associative array:

**model** Model tested.

**target** Target where action is displayed. Value can be `grid`, `toolbar-grid` or `toolbar-edit` (related to action's `targets`).

**item** Only populated when `target == 'toolbar-edit'`.

**class** Name of the controller class calling the function (this way you can differentiate appdesk and inspectors for instance).

```
<?php
return array(
    'actions' => array(

```

```

'action_id' => array(
    'action' => array(
        'action' => 'confirmationDialog',
        'dialog' => array(
            'contentUrl' => '{{controller_base_url}}delete/{{_id}}',
            'title' => 'Delete',
        ),
    ),
    'label' => __('Delete'),
    'primary' => true,
    'icon' => 'trash',
    'red' => true,
    'targets' => array(
        'grid' => true,
        'toolbar-edit' => true,
    ),
    'disabled' => function($item) {
        return false;
    },
    'visible' => function($params) {
        return !isset($params['item']) || !$params['item']->is_new();
    },
),
),
);

```

**Default actions and particular cases** Default actions (such as add or edit) can be overloaded with this actions key. Arr::merge is used to merge defined actions with default actions.

To hide an action, set its value to false:

```

<?php
return array(
// ...
'actions' => array(
    'add' => false,
),
);

```

**Placeholders** Placeholders are available in order to simplify action targets and labels. First, some placeholders are always available:

- controller\_base\_url: URL of the crud controller
- model\_label: generated from model class name
- \_id: ID of the item
- \_title: Title of the item
- \_context: if the item has the Contextable behaviour

Additionally, all dataset keys can be used as placeholders.

## Icons

This key contains all common icons related to the model. Structure is similar to the icons key of the [Metadata configuration file](#) :

```
<?php
return array(
    'icons' => array(
        64 => 'static/apps/noviosos_page/img/64/page.png',
        32 => 'static/apps/noviosos_page/img/32/page.png',
        16 => 'static/apps/noviosos_page/img/16/page.png',
    ),
);
```

## Appdesk

Configuration for [Nos\Orm\Model](#)'s appdesk.

Associative array:

**model** Model name.  
**css** Optional. List of css file to load in order to add specific styles.  
**notify** Optional. Allows you to notify the user when displaying the appdesk.  
**query** Optional. Additional informations about the query.  
**search\_text** Optional. Array of columns in which we search when the user fills appdesk's search bar.  
**data\_mapping** Optional. Defines which data\_mapping items are displayed.  
**inspectors** Optional.  
**views** Optional.  
**selectedView** Optional. Default selected view identifier.  
**inputs** Optional. How to process additional parameters sent to the appdesk.  
**i18n** Optional. Extends default text items.  
**thumbnails** Optional, boolean. Can the appdesk display items as thumbnails ?  
**tree** Optional (automatically filled when model has the [Tree](#) behaviour enabled).  
**appdesk** Optional. Additional display information about the appdesk.

### notify

Allows you to notify the user when displaying the appdesk.

**message** Message you want to display.  
**type** Type of notification.

### query

Associative array. All keys are optional. Most keys are similar than the [find](#) function second parameters.

**model** Model on which query is executed.

**limit****order\_by****related**

**callback** Array of callback functions allowing you to customize the query (first parameter is the current query, must return the modified query).

**data\_mapping**

Associative or simple array. Defines which data\_mapping items from [Common](#) configuration we display (mostly filtering).

It is also possible to define new custom data\_mapping items which will be only used on the appdesk.

If only value is defined, appdesk will display the data\_mapping item from common configuration.

If it is a key => value association (value must then be an array), then the data\_mapping item from common configuration is extended by the value.

```
<?php
return array(
    // ...
    'data_mapping' => array(
        'col1', // will display the col1 data_mapping item from common configuration.
        'col2' => array( // if col2 exists on common configuration data_mapping key then it is extended
            // ...
        ),
    ),
);
```

**inspectors**

Associative or simple array. Defines which inspectors are used on appdesk.

It is also possible to define new custom inspectors which will be only used on the appdesk.

If only value is defined: \* appdesk will display the inspector located at *inspector/inspector\_name* if the value is *inspector\_name*. \* it also supports inspector class names (*MyAppController\_Admin\_Inspector\_Name*).

If it is a key => value association (value must then be an array), then the inspector configuration is extended by the value.

```
<?php
return array(
    // ...
    'inspectors' => array(
        'inspector1', // will display the inspector located at inspector/inspector1.
        '\My\App\Controller\Admin_Inspector_Name', // will display the inspector which class is \My\
        'inspector2' => array( // if inspector/inspector2 exists, then it is extended ; otherwise it
            // ...
        ),
    ),
);
```

## views

Associative array defining different way of displaying the appdesk. The key is the view identifier. Value is view configuration:

- name** Optionnal. Display view name in view selector
- virtual** Optionnal. Is the view present on the view selector ?
- json** Array of javascript files to load. These javascript extends appdesk configuration.

## inputs

How to process additional parameters sent to the appdesk. Associative array, to define a callback for each parameter.

```
<?php
return array(
    // ...
    'inputs' => array(
        'monk_species_id' => function($value, $query) {
            // ...
            return $query;
        },
    ),
);
```

## thumbnails

Can the appdesk display items as thumbnails ?

If defined to true, data\_mapping has to define two keys:

- thumbnail** url of item thumbnail.
- thumbnailAlternate** Default thumbnail when there is no thumbnails or thumbnail can't be found.

## tree

Defines how the model tree is constructed on the appdesk. It is automatically filled when model has the [Tree](#) behaviour. Associative array:

- models** Models to be loaded on the tree. Array of associative array:
  - model** Model class name
  - order\_by**
  - childs** Array of model class name. Which models instances are children.
  - dataset** dataset information sent by objects in json format.
  - callback** Array of callback functions allowing you to customize the query (first parameter is the query).

## roots

- model** Model class name
- order\_by**

**where**

## appdesk

Associative array describing how appdesk interacts and is displayed. All items are automatically generated, but can be overloaded.

**appdesk** Defines how appdesk is displayed. Associative array:

**defaultView** Default view of appdesk. It can be ‘grid’ (default), ‘treeGrid’ or ‘thumbnails’.

**buttons** Associative array containing grid toolbar actions information. See [Actions](#).

**splitterVertical** Size of the vertical splitter.

**inspectors** Associative array containing information about inspectors. Key is the inspector identifier, value is its configurations. See [Inspectors](#) configuration.

**grid** Grids informations. Associative array:

**urlJson** Url of the json API to get items

**columns** Columns informations

**treeGrid**

**urlJson** Url of the json API to get items

**initialDepth** Initial depth of the tree opening

**tab** Tab information (see [nosTabs](#)).

**reloadEvent** Event name that will reload appdesk.

**actions** Associative array containing main grid actions information. See [Actions](#).

## Inspectors

Configuration for an inspector. Associative array depending on inspector type.

The only common keys are *input*, which describes how the inspector will affect the main grid, and *appdesk*, which defines how it is displayed.

### input

Associative array:

**key** Key name on which the main grid will be filtered. By default, if query key is not defined, must be the column name on which you want to filter the model.

**query** Optional. Callback function defining how to interact with the main grid query. The function gets two parameters ; the first is the value sent by the inspectors (when items are selected), and the second is the current query. The function must return the transformed query.

## appdesk

Associative array. All keys are optional:

**label** Main label of the inspector.

**contextChange** Does the inspector reloads when user selects an other context.

**reloadEvent** Event name that will reload the inspector?

**vertical** Is the appdesk vertical or horizontal ?

**inputName** Key on which selected values are sent.

**multiContextHide** Hide inspector when appdesk filtered on more than one contexts.

## Model inspector

Associative array:

**model** Model class name

**query** Optional. Additional informations about the query. See *query in appdesk configuration*.

**data\_mapping** Optional. Defines which data\_mapping items are displayed. See *data\_mapping in appdesk configuration*.

**appdesk** Optional. Additional display information about the appdesk.

**appdesk** Associative array:

**grid** Optional. Grids informations. Associative array:

**urlJson** Url of the json API to get items

**columns** Columns informations.

## Model tree inspector

Associative array:

**model** Model class name

**data\_mapping** Optional. Defines which data\_mapping items are displayed. See *data\_mapping in appdesk configuration*.

**appdesk** Optional. Additional display information about the appdesk.

**models** Optional. See *appdesk tree configuration*.

**roots** Optional. See *appdesk tree configuration*.

**root\_node** Optional. Add a global root node. Associative array containing dataset values (columns to be displayed).

**appdesk** Associative array:

**treeGrid** Optional. Grids informations. Associative array:

**urlJson** Url of the json API to get items

**columns** Columns informations.

## Date inspector

Associative array:

**input\_begin** Name of the input for the begin date. Default value: date\_begin.

**input\_end** Name of the input for the end date. Default value: date\_end.

### labels

**Custom dates** Default value: Custom dates.

**from begin to end** Default value: from {{begin}} to {{end}}.

**until end** Default value: until {{end}}.

**since begin** Default value: since {{begin}}.

### options

Array of options displayed by inspector. Default value: array('custom', 'since', 'month', 'year').

### since

**optgroup** Label of this group in the inspector. Default value: Since.

**options** Associative array. Key is the date, string is processed by Date Class, value is the label of the date.

### month

**optgroup** Label of this group in the inspector. Default value: Previous months.

**first\_month** Month to start list from. Default value: now.

**limit\_type** Limit type where the list end (value can be year or month). Default value: year.

**limit\_value** Number of items to display. For example, if limit\_type is month and limit\_value is 5, it will display the last 5 months. Default value: 1.

### year

**optgroup** Label of this group in the inspector. Default value: Years.

**first\_year** Year to start list from. Default value: now.

**limit** Number of years to display. Default value: 4.

## Plain data inspector

Displays static data. Associative array:

**data** Array of items. Each item is an associative array:

**id**

**title**

**icon** Optional.

### input

**query** Here this key is mandatory.

### appdesk

**url** Url to load in order to display list extension.

**grid** How is the inspector grid displayed

**columns** Grid columns. Associative array, key is column identifier and value is an associative array:

**headerText** Column title

**visible** Is key visible

**dataKey** For each data item, defines which key is displayed

## Crud Controller

The CRUD controller is in charge of generating the forms (add, edit & delete) related to an item / model and handling automatically the multilingual / translation problematic.

**controller\_url** Url of the CRUD controller.

**css** Optional. List of css file to load in order to add specific styles.

**model** Which model it generates the form for.

**environment\_relation** Relation name. Allows to define a children / parent relationship.

**tab** Tab informations (such as the icon & label), see *nosTabs*

**views** Optional. Views locations.

**layout** How the form looks like and where fields are displayed inside it. Optional if *layout\_insert* and *layout\_update* are defined.

**layout\_insert** Optional. Specific layout for insert. Will use *layout* as default value.

**layout\_update** Optional. Specific layout for update. Will use *layout* as default value.

**fields** All fields displayed in the form.

```
<?php
return array(
    'controller_url' => '',
    'environment_relation' => null,
    'model' => '',
    'tab' => array(
        'iconUrl' => '',
        'labels' => array(
            'update' => null,
            'insert' => 'New item',
            'blankSlate' => 'Translate an item',
        ),
    ),
    'layout' => array(),
    'fields' => array(),
    'require_js' => array(),
    'views' => array(
        'form' => 'nos::crud/form',
        'delete' => 'nos::crud/delete_popup',
    ),
);
```

## environment\_relation

The environment\_relation must contain a relation name of type Orm\\BelongsTo.

It allows to use the GET['environment\_id'] in an action of this model.

It will be used to populate the column associated with the relation. Examples include:

- Add a page at a specific location inside the tree (with a pre-selected parent) ;
- Add a media in a specific folder ;
- Add a monkey inside a species ;
- Add a blog post inside a category.

**Some examples:**

```
<?php
// Add a sub-page action
'action' => array(
    'action' => 'nosTabs',
    'tab' => array(
        // The 'page_parent_id' will be populated with $_GET['environment_id'] from the action
        'url' => '{{controller_base_url}}insert_update?environment_id={{_id}}&context={{_context}}',
    ),
),

// Add a media in this folder action
'action' => array(
    'action' => 'nosTabs',
    'tab' => array(
        // The 'media_folder_id' will be populated with $_GET['environment_id'] from the action
        'url' => '{{controller_base_url}}insert_update?environment_id={{id}}',
    ),
),
```

## tab

**See also:**

*nosTabs*

The tab configuration array has a special labels key, to handle several label depending on the case.

**insert** Adding a new item

**blankSlate** Translating an existing item

**update** Editing an existing item

- insert and update must contain plain string value ;
- update can either contain a plain string value, or a callable taking one argument: the \$item ;
- The default value for labels.update is the item's title.

```
<?php
return array(
    'tab' => array(
```

```
'iconUrl' => 'static/apps/noviusos_monkey/img/16/monkey.png',
// Add form will user 'insert'
// Edit form will use item's title
// Translate form (multilingual) will use 'blankSlate'
'labels' => array(
    'insert' => __('Add a monkey'),
    'blankSlate' => __('Translate a monkey'),
),
),
);
```

### views

**form** View for the form (both insert and update). Default is nos::crud/form.

**delete** View for the delete popup. Default is nos::crud/delete\_popup.

**insert** Optional. View for the insert form (will use `form` value as default)

**update** Optional. View for the update form (will use `form` value as default)

### layout

The layout is a data passed to the parameters of the view. It list all the views needed to render the form.

There are two syntaxes:

- the full syntax ;
- a simplified syntax, which is used 90% of the time.

The **full syntax** for using a layout is the following:

```
<?php
'layout' => array(
    'first_view' => array(
        'view' => 'nos::form/layout_standard',
        'params' => array(
            // View data (depends on the view).
            'title' => '',
            'content' => '',
        ),
    ),
    'second_view' => array(
        'view' => 'noviusos_page::admin/page_form',
        // No 'params'
    ),
    // More views can be used here.
),
```

In addition to view-specific params / data, Novius OS always include the following vars:

- `$item` : the instance of the model currently edited (or added / translated).
- `$fieldset` : the form instance which holds all fields definition.

Because 90% of the time, we want to use nos::form/layout\_standard as the view for the layout, a **simplified syntax** was created: only write the view params of the standard layout.

It's much more limitating because you can only use one view to render the layout, and it has to be nos::form/layout\_standard. But that's what should be used 90% of the time.

```
<?php
'layout' => array(
    // View data
    'title' => '',
    'content' => '',
),
)
```

We only need to define the view data for the standard layout, and it will be wrapped like so:

```
<?php
setLayout = array(
    array(
        'view' => 'nos::form/layout_standard',
        'params' => $layout,
    ),
);
)
```

```
<?php
// The following...
return array(
    'layout' => array(
        'view_1' => array(
            'view' => 'nos::form/layout_standard',
            'params' => array(
                // View data (depends on the view).
            ),
        ),
    ),
);
;

// ... is the same as this:
return array(
    'layout' => array(
        // View params for ``nos::form/layout_standard``.
    ),
);
)
```

## Native views included in Novius OS

- Used as **container** for other layouts / views
  - *Standard layout*: used as a container for other views ;
  - *Expander*: used inside layout\_standard.content in the Pages application ;
- Used as **final** views:
  - *Fields*: used inside layout\_standard.content in the User application ;
  - *Accordion*: used inside layout\_standard.menu in the Pages application.

[Views](#)

## fields

Contains the fields definition array.

The `fields` syntax is based on an existing FuelPHP feature, which is used to configure form attributes for each column of a Model :

### See also:

FuelPHP documentation on `Model::$_properties`

In addition to standard form fields, Novius OS has `renderers`, which are a bit more advanced. For instance, they allow to select a media, a page, a date...

The field name is determined using the key. Then, for each field:

- label** Text for the label. Won't be shown for hidden fields
- form** array Attributes of the `<input>` tag
- renderer** Class name of a renderer
- renderer\_options** (optional) array Options for the renderer
- validation** (optional) array Rules used to validate the field.
- expert** (optional) boolean Should the field be visible only to expert users? Default `false`.
- show\_when** (optional) callable Custom callback function to alter the visibility of the field. Must return `true` for the field to be shown.
- populate** (optional) callable Custom callback function to set value(s) of the field. Takes the item as param.
- before\_save** (optional) callable Custom callback function to perform changes on the field before saving it. Takes the item and validated POST content as params.

To choose how the field is displayed, you only need to specify either `form` (a native HTML `<input>`) or a `renderer` (like a date picker or a wysiwyg), you don't need both. If both keys are filled, the renderer will be used to display the field (and the `form` key will be ignored).

Configuration example:

```
<?php
return array(
    'name' => array(
        'label' => 'Text shown next to the field',
        'form' => array(
            'type' => 'text',
            'value' => 'Default value',
        ),
        'validation' => array(),
    );
);
```

Advanced configuration example:

```
<?php
$options = array(
    $value => $label
    ...
);
return array(
    'name' => array(
```

```

'label' => 'Text shown next to the field',
'form' => array(
    'type' => 'select',
    'options' => $options,
),
'populate' => function($item) {
    //example: returns the id of a related model
    return $item->relation->rel_id;
},
'before_save' => function($item, $data) {
    //example: set relation properly
    unset($item->relation);
    if (!empty($data['name'])) {
        $item->relation = Model::find($data['name']);
    }
}
);

```

**Standard fields** Bold text is the value for the type property.

- <input type=**"text"**>
- <input type=**"password"**>
- <textarea>
- <select>
- <input type=**"radio"**>
- <input type=**"checkbox"**>
- <input type=**"submit"**>
- <input type=**"button"**>
- <input type=**"file"**>

```

<?php
return array(
    'gender' => array(
        'label' => 'Gender',
        'form' => array(
            'type' => 'select',
            'options' => array(
                'm' => 'Male',
                'f' => 'Female',
            )
        ),
        'validation' => array('required'),
    ),
);

```

<button type=**"submit"**>

- type = submit generates <input type="submit">
- type = button generates <input type="button">

The `tag` property can be used to force a precise HTML tag, it's useful for a `submit` button.

FuelPHP will automatically use the `value` as the button's text.

```
<?php
return array(
    'save' => array(
        'form' => array(
            'type' => 'submit',
            'tag' => 'button',
            'value' => 'Save',
        ),
    ),
);
```

New in version Chiba2.1.

The `save` key no longer required in CRUD fields configuration.

**Renderers (advanced fields)** The renderer list is available *in a dedicated page*.

## Glossary

**Launcher** Icon on the *home tab*. It's often the most visible part of an application.

**Enhancer** They are used in WYSIWYG editors abd provide functionalities for the front-office.

**URL Enhancer** A specific type of enhancers, which handle its own URLs. For example, every blog post has dedicated URL.

**Template** They are similar to other CMS' templates or themes and provide a view for the front-office.

## Permissions

This configuration file is used to define the permissions used in your application.

It has the same syntax as the **full** version of the `crud layout`.

i.e. You need to configure one or several (`view + params`) pair(s), like so:

```
<?php
return array(
    'all' => array(
        'view' => 'nos::form/accordion',
        'params' => array(
            'accordions' => array(
                'standalone' => array(
                    'title' => __('Permissions for this application'),
                    'view' => 'nos::admin/permissions/standalone',
                    'params' => array(
                        'list' => array(
                            'noviusos_app::create' => array(
                                'label' => __('Can create new items'),
                                'checked' => true,
                            ),
                            'noviusos_app::delete_locked' => array(
                                'label' => __('Can delete locked item'),
                            ),
                        ),
                    ),
                ),
            ),
        ),
    ),
);
```

```

        ),
        ),
        ),
        ),
        ),
        ),
        );

```

In addition to view-specific params / data, Novius OS always include the following vars:

- `$role` : Current *role* for which the permissions are applicable to.

We (kindly) provide a native view to cover basic usage: *Permissions standalone*.

## Menu item driver

**name** The name of the driver

**texts** Array

**add** Label of the add button for the driver

**new** Label for a new item build with the driver

**attributes** Array of EAV attributes save in the `Nos\Menu\Model_Menu_Item`

**icon** URL of the icon representing the driver

**view** Optional. Path of the view use to display an item build with the driver

**See also:**

*Nos\Menu\Menu\_Driver::html*

**admin** Array

**layout** How the form, for item build with the driver, looks like and where fields are displayed inside it.

**fields** All fields displayed in the form.

**See also:**

*Crud Controller*

```

<?php
return array(
    'name' => __('Link to a page'),
    'texts' => array(
        'add' => __('Add a new link to a page'),
        'new' => __('New link to a page'),
    ),
    'icon' => 'static/apps/noviusos_menu/img/16/page.png',
    'attributes' => array(
        'page_id',
    ),
    'view' => 'noviusos_menu::driver/page',
    'admin' => array(

```

```

'layout' => array(
    'standard' => array(
        'view'    => 'nos::form/accordion',
        'params'  => array(
            'accordions' => array(
                'main' => array(
                    'fields' => array(
                        'mitem_page_id',
                    ),
                ),
            ),
        ),
    ),
    array(
        'view'    => 'noviusos_menu::admin/driver/page',
    ),
),
'fields' => array(
    'mitem_page_id' => array(
        'label' => ___('Page:'),
        'form'  => array(
            'type' => 'hidden',
            'class' => 'menu_item_page_id',
        ),
        'renderer' => 'Nos\Renderer_Item_Picker',
        'renderer_options' => array(
            'model' => 'Nos\Page\Model_Page',
            'appdesk' => 'admin/noviusos_page/appdesk',
            'defaultThumbnail' => 'static/apps/noviusos_page/img/64/page.png',
            'texts' => array(
                'empty' => __('No page selected'),
                'add' => __('Pick a page'),
                'edit' => __('Pick another page'),
                'delete' => __('Un-select this page'),
            ),
        ),
    ),
),
),
),
),
);

```

## Template variation

The configuration of a template variation is assumed to be `application_name::variation/template_name`.

**init** Optional. A callback function. Call to initialize a `Nos\Template\Variation\Model_Template_Variation`.  
Returns an array with fields names in keys and the initial values in values.

**admin** Array

**layout** How the form, for item build with the driver, looks like and where fields are displayed inside it.

**fields** All fields displayed in the form.

**See also:**

[Crud Controller](#)

- layout** Optional. A callback function. If exist, the return value overload the template configuration. Take the `Nos\Template\Variation\Model_Template_Variation` in parameter.
- cols** Optional. A callback function. If exist, the return value overload the template configuration. Take the `Nos\Template\Variation\Model_Template_Variation` in parameter.
- rows** Optional. A callback function. If exist, the return value overload the template configuration. Take the `Nos\Template\Variation\Model_Template_Variation` in parameter.
- file** Optional. A callback function. If exist, the return value overload the template configuration. Take the `Nos\Template\Variation\Model_Template_Variation` in parameter.
- screenshot** Optional. A callback function. If exist, the return value overload the template configuration. Take the `Nos\Template\Variation\Model_Template_Variation` in parameter.

    ),
);

```

### 1.1.3 Constants

All native constants of FuelPHP are available but links to specific Novius OS directories.

**See also:**

FuelPHP native constants documentation.

#### constant NOSROOT

Path where Novius OS is installed.

#### constant PUBLIC\_DIR

Contains the name of the public directory. Initialized to `public` if not set.

New in version 4.2.

#### constant NOSPATH

Path of Novius OS core: `NOSROOT/novius-os/framework/`.

#### constant APPPATH

Overload of the native FuelPHP's constant. Path to the application directory: `NOSROOT/local/`.

#### constant COREPATH

Overload of the native FuelPHP's constant. Path to the FuelPHP core directory: `NOSROOT/novius-os/fuel-core/`.

#### constant DOCROOT

Overload of the native FuelPHP's constant. Path to the location where the *startup script* is: `NOSROOT/public/`.

#### constant PKGPATH

Overload of the native FuelPHP's constant. Path to the packages directory: `NOSROOT/novius-os/packages/`.

### 1.1.4 i18n functions

`__($message, $default = null)`

Retrieves a translation from the last loaded dictionary.

#### Parameters

- **\$message** (*string*) – The message to translate.
- **\$default** (*string*) – The default text to return when the message is not found. Default value is the message itself.

**Returns** The translation or `null` if not founded

**n\_\_** (\$singular, \$plural, \$n = false)

The plural version of \_\_\_. Some languages have more than one form for plural messages dependent on the count.

#### Parameters

- **\$singular** (string) – The singular form of the string to be converted. Used as the key for the search in the dictionary
- **\$plural** (string) – The plural form
- **\$n** (string) – Used to determine which plural form to used depending locale.

#### Returns

The translation or, if not founded, \$singular is returned if n == 1, otherwise \$plural  
If third parameter is ommited and translation founded, return an array of singular and plural forms

**\_\_\_** (\$group, \$message, \$default = null)

Retrieves a translation from a specific dictionary.

#### Parameters

- **\$group** (string) – Which dictionary to look into.
- **\$message** (string) – The message to translate.
- **\$default** (string) – The default text to return when the message is not found. Default value is the message itself.

**Returns** The translation or null if not founded

## 1.1.5 Models

### Model

**class Nos\Orm\Model**

Extends *Model of FuelPHP ORM*.

Novius OS Model have some differences compare with FuelPHP Model :

- Novius OS implements a cache mechanism for properties when they are fetched from the database. By default, cache files are save in NOSPATH/local/cache/fuelphp/list\_columns.
- In property definition, put convert\_empty\_to\_null key to true if you want that this property stores a null value when it receives empty string.

### Configuration

**property Nos\Orm\Model::\$title\_property**

Defines the title property of a model. Can be a column name or a closure (which take current \$item as parameter).

If not defined, automatically set to first column which has title, label or name in its name, or (as last resort) the first varchar.

**property Nos\Orm\Model::\$behaviours**

Defines the behaviours of model. Same syntax as *observers*.

**property** Nos\Orm\Model::\$attachment

Defines the attachments of a model. Attachment is a special type of *relations* created for Novius OS. See [Nos\Attachment](#).

**property** Nos\Orm\Model::\$providers

Defines the behaviours of model.

**Relation** Required. Wherein the relation is based on the provider. Must be a multiple relation and have cascade\_save activate.

**Value\_property** Optional. Set to value if empty. The fields containing the provider value.

**Key\_property** Optional. Set to key if empty. The fields containing the provider key.

**Value\_relation** Optional. If set, must contains a single relation name and then the provider value become the model.

In Novius OS, you can configure model by a file configuration. For sample: if in your application you define a Model\_Monkey class, you can create a file config/model/monkey.config.php to extend configuration. All this attributes can be defined in configuration file : properties, table\_name, title\_property, observers, behaviours, providers and all relations types (has\_many, belongs\_to, has\_one, many\_many, twinnable\_has\_many, twinnable\_belongs\_to, twinnable\_has\_one, twinnable\_many\_many and attachment).

**Examples** Example in the class definition:

```
<?php
class Model_Example extends \Nos\Orm\Model
{
    // In this example, attachments use defaults properties
    protected static $_attachment = array(
        'avatar' => array(),
        'cv' => array(),
    );

    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Contextable' => array(
            'events' => array('before_insert'),
            'context_property' => 'ex_context',
        ),
    );

    // In this example, use a column name for defined title_property
    protected static $_title_property = 'ex_reference';
}
```

Example in configuration file:

```
<?php
return array(
    'attachment' => array(
        'avatar' => array(
            'dir' => 'namespace/model_name/avatar/',
            'image' => true,
            'alias' => 'avatar',
        ),
        'curriculum_vitae' => array(
            'dir' => 'namespace/model_name/curriculum_vitae/',
            'alias' => 'cv',
            'extensions' => array('doc', 'odt', 'pdf'),
        ),
    ),
)
```

```

        'check' => array('ClassName', 'methodName'),
    ),
),
behaviours' => array(
    'Nos\Orm\Behaviour_Contextable' => array(
        'events' => array('before_insert'),
        'context_property' => 'ex_context',
    ),
),
// In this example, use a closure for defined title_property
'title_property' => function($item) {
    return $item->ex_reference;
},
);

```

## Relations

**property** Nos\Orm\Model::\$linked\_wysiwygs

- Relation type: *has\_many*.
- Model: *Nos\Model\_Wysiwyg*

**property** Nos\Orm\Model::\$linked\_medias

- Relation type: *has\_many*.
- Model: *Nos\Media\Model\_Link*

**Warning:** Don't use these relations directly, we created providers for them.

## Native Providers

**property** Nos\Orm\Model::\$medias

Provider for *Nos\Media\Model\_Link* linked to model.

```

<?php
$item->medias->avatar; // Get a Model_Link named 'avatar'
$item->medias->avatar->media; // Get Model_Media named 'avatar'

$item->medias->cv = $Model_Media; // Attach a Model_Media named 'cv'

$item->medias->cv = null; // Detach a media from an item
// or
unset($item->medias->cv);

```

**property** Nos\Orm\Model::\$wysiwygs

Provider for *Nos\Model\_Wysiwyg* linked to model.

```

<?php
$item->wysiwygs->content; // Get a Model_Wysiwyg named 'content'
$item->wysiwygs->content->wysiwyg_text; // Get content of Model_Wysiwyg named 'content'

$item->wysiwygs->summary = 'foo'; // Set a Model_Wysiwyg named 'content', with content 'foo'.

```

```
$item->wysiwygs->summary = null; // Remove a wysiwyg from an item  
// or  
unset ($item->wysiwygs->summary);
```

## Methods

**static Nos\Orm\Model::title\_property**

**Returns** Title property of model. See [Model::\\$title\\_property](#).

**static Nos\Orm\Model::table**

**Returns** The DB table name of model.

**static Nos\Orm\Model::behaviours** (\$specific = null, \$default = null)

**static Nos\Orm\Model::add\_properties** (\$properties)

**Parameters**

- **\$properties** (array) – Additional properties (merged).

**static Nos\Orm\Model::addRelation** (\$type, \$name, array \$options = array())

Add a relation to model

**Parameters**

- **\$type** (string) – A valid relation type.
- **\$name** (string) – The relation name to add.
- **\$options** (array) – The relation options

**Throws** \FuelException if \$type is not a valid one.

**static Nos\Orm\Model::providers** (\$specific = null, \$default = null)

Get the class's providers and what they provide

**Parameters**

- **\$specific** (string) – Provider to retrieve info of, allows direct param access by using dot notation
- **\$default** (mixed) – Return value when specific key wasn't found

**Throws** Nos\Orm\UnknownProviderException

**Returns** The specific provider if it exist and is requested or the default value. Else, array of all providers.

**static Nos\Orm\Model::addProvider** (\$name, array \$properties)

Add a provider to model

**Parameters**

- **\$name** (string) – The provider name
- **\$properties** (array) – The provider properties

**Throws** Nos\Orm\InvalidProviderException

**static Nos\Orm\Model::configModel**

**Returns** Array configurations of the model.

**static Nos\Orm\Model::getApplication**

**Returns** Application name of the model.

Nos\Orm\Model::event (\$method, \$args = array())

Trigger an event (caught by behaviours) on the item.

**Parameters**

- **\$method** (*string*) – Name of the event, also name of the method Behaviours.
- **\$args** (*array*) – Arguments of the event.

**static** Nos\Orm\Model::**eventStatic** (\$method, \$args = array())

Trigger an event (caught by behaviours) on the model class.

**Parameters**

- **\$method** (*string*) – Name of the event, also name of the method Behaviours.
- **\$args** (*array*) – Arguments of the event.

**static** Nos\Orm\Model::**prefix****Returns** Prefix of column name. Computed from the primary key name (everything before the first \_ character).Nos\Orm\Model::**title\_item**()**Returns** Returns the item's title, calculated from *Model:::\$title\_property*.Nos\Orm\Model::**pick** (\$column[, \$column[, \$column[... ]]])**Parameters**

- **\$column** (*array*) – A column name.

**Returns** Returns the first non empty column. Will add column prefix (see *Model:::prefix*) when needed.**Model\_Page****class** Nos\Page\B**Model\_Page**Extends *Nos\Orm\Model*.**Constants****Page types**

**constant** Nos\Page\Model\_Page::**TYPE\_CLASSIC**  
**constant** Nos\Page\Model\_Page::**TYPE\_EXTERNAL\_LINK**

Possible values of the page\_type column.

**External target types**

**constant** Nos\Page\Model\_Page::**EXTERNAL\_TARGET\_NEW**  
**constant** Nos\Page\Model\_Page::**EXTERNAL\_TARGET\_SAME**

Possible values of the page\_external\_link\_type column.

**Lock types**

**constant** Nos\Page\Model\_Page::**LOCK\_UNLOCKED**  
**constant** Nos\Page\Model\_Page::**LOCK\_DELETION**

Possible values of the page\_lock column.

## Relations

**property** Nos\Page\Model\_Page::\$children

- Relation type: *has\_many*.
- Model: *Model\_Page*

**property** Nos\Page\Model\_Page::\$parent

- Relation type: *belongs\_to*.
- Model: *Model\_Page*

## Behaviours

- *Twinnable*
- *Tree*
- *Virtual path*
- *Sortable*
- *Publishable*

## Methods

Nos\Page\Model\_Page::htmlAnchor (\$attributes = array())

### Parameters

- **\$attributes** (*array*) –

Array of attributes to be applied to the anchor tag.

If key ‘href’ is set in \$attributes parameter:

- if is a string, used for href attribute
- if is an array, used as argument of ->url() method

If key ‘text’ is set in \$attributes parameter, its value replace page title

**Returns** Returns an HTML anchor tag with, by default, page URL in href and page title in text.

Nos\Page\Model\_Page::url (\$params = array())

### Parameters

- **\$params** (*array*) –

**preview** If set, returns a preview URL

**Returns** The absolute URL of the page

## Media Models

**Model\_Media**

**class** Nos\Media\Model\_Media

Extends *Nos\Orm\Model*.

## Relations

**property** Nos\Media\Model\_Media::\$**folder**

- Relation type: *belongs\_to*.
- Model: *Model\_Folder*

## Behaviours

- *Virtual path*

## Methods

Nos\Media\Model\_Media::**deleteFromDisk**()

Delete the original media file from the disk.

Nos\Media\Model\_Media::**deleteCache**()

Delete all the cached versions (thumbnails) of the media files from the disk.

Nos\Media\Model\_Media::**path**()

**Returns** Private absolute media file path.

Nos\Media\Model\_Media::**htmlImg** (\$params = array())

### Parameters

- **\$params** (array) – the attributes array

**Returns** If the media file is an image, return an html image tag of the media.

Sets width, height, alt attributes is not supplied.

Nos\Media\Model\_Media::**htmlImgResized** (\$max\_width = null, \$max\_height = null, \$params = array())

### Parameters

- **\$max\_width** (array) – Max width of the image.
- **\$max\_height** (array) – Max height of the image.
- **\$params** (array) – the attributes array

**Returns** If the media file is an image, return an html image tag of the media resized.

Sets width, height, alt attributes is not supplied.

Nos\Media\Model\_Media::**htmlAnchor** (\$attributes = array())

### Parameters

- **\$attributes** (array) –

Array of attributes to be applied to the anchor tag.

If key ‘text’ is set in \$attributes parameter, its value replace media title

**Returns** Returns an HTML anchor tag with, by default, media URL in href and media title in text.

Nos\Media\Model\_Media::**url** (\$absolute = true)

### Parameters

- **\$absolute** (bool) – Default true, if false return relative URL :returns: Public media file URL.

Nos\Media\Model\_Media::**urlResized** (\$max\_width = 0, \$max\_height = 0, \$absolute = true)

### Parameters

- **\$max\_width** (array) – Max width of the image.
- **\$max\_height** (array) – Max height of the image.
- **\$absolute** (bool) – Default true, if false return relative URL

**Returns** If the media file is an image, media URL for specify size parameters. False otherwise.

Nos\Media\Model\_Media::**isImage**()

**Returns** True or false, depend if media is an image.

Nos\Media\Model\_Media::**getToolkitImage**()

**Returns** Returns a *Nos\Toolkit\_Image* based on the media if is an image, False otherwise.

## Model\_Link

class Nos\Media\B**Model\_Link**

Link between a *Model\_Media* and a *Nos\Orm\Model*.

Extends *Nos\Orm\Model*.

### Columns

**medil\_id** Model\_Link primary key.

**medil\_from\_table** DB table name of the model which the media is linked to.

**medil\_foreign\_id** ID of the model which the media is linked to.

**medil\_foreign\_context\_common\_id** Common ID of the model which the media is linked to.

**medil\_key** string key identifying the linked media.

**medil\_media\_id** ID of the linked media.

One of **medil\_foreign\_id** and **medil\_foreign\_context\_common\_id** columns is NULL for each row.

### Relations

**property** Nos\Media\Model\_Link::\$**media**

- Relation type: *belongs\_to*.
- Model: *Model\_Media*

## Model\_Folder

class Nos\Media\B**Model\_Folder**

Extends *Nos\Orm\Model*.

### Relations

**property** Nos\Media\Model\_Folder::\$**children**

- Relation type: *has\_many*.
- Model: *Model\_Folder*

**property** Nos\Media\Model\_Folder::\$**media**

- Relation type: *has\_many*.
- Model: *Model\_Media*

**property** Nos\Media\Model\_Folder::\$**parent**

- Relation type: *belongs\_to*.
- Model: *Model\_Folder*

## Behaviours

- *Tree*
- *Virtual path*

## Methods

`Nos\Media\Model_Folder::deleteFromDisk()`

Delete the folder and all its content (recursively).

`Nos\Media\Model_Folder::deleteCache()`

Delete all the public and cached entries (image thumbnails) of this folder

`Nos\Media\Model_Folder::path ($file = '')`

### Parameters

- **\$file** (*string*) – A file name to append to the path.

**Returns** Absolute folder path.

`Nos\Media\Model_Folder::count_media()`

**Returns** Number of media contained in the folder and all its sub-folders.

`Nos\Media\Model_Folder::count_media_usage()`

**Returns** Number of media in use (by the applications) contained in this folder and all its sub-folders.

## User Models

### Model\_User

`class Nos\User\Model_User`  
Extend `Nos\Orm\Model`.

#### Relations

`property Nos\User\Model_User::$roles`

- Relation type : *many-many*.
- Model : `Model_Role`

`Nos\User\Model_User::check_permission ($permission_name, $category_key = null)`

### Parameters

- **\$permission\_name** (*string*) – Name of the permission to check against
- **\$category\_key** (*string*) – (optional) If the permission has categories, the category key to check against

**Returns** True if the user has the required authorisation, false otherwise

## Methods

`Nos\User\Model_User::check_password ($password)`

### Parameters

- **\$password** (*string*) – Password to check if it matches the user's password

**Returns** True if passwords match, false otherwise.

`Nos\User\Model_User::generate_md5()`

Generate a new md5 for the user (store in the `user_md5` column).

## Model\_Role

```
class Nos\User\Model_Role
    Extend Nos\Orm\Model.
```

### Relations

**property** Nos\User\Model\_Role::\$users

- Relation type : *many-many*.
- Model : *Model\_User*

### Methods

Nos\User\Model\_Role::checkPermission (\$permission\_name, \$category\_key = null, \$allow\_empty = false)

Check whether a permissions exists with the given category.

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission to check against
- **\$category\_key** (*string*) – (optional) If the permission has categories, the category key to check against
- **\$allow\_empty** (*bool*) – Should we grant access when nothing is configured?

**Returns** **bool** true or false

Nos\User\Model\_Role::listPermissionCategories (\$permission\_name)

List all the categories of a given permission name. Returns an array of string or false when the role has not access, or the permission name does not exists.

#### Parameters

- **\$permission\_name** (*string*) – The name of the permission to retrieve categories from
- **\$category\_key** (*string*) – (optional) If the permission has categories, the category key to check against

**Returns** array | false An array containing the list of categories (values) for the request permission name

Nos\User\Model\_Role::checkPermissionOrEmpty (\$permission\_name, \$category\_key = null)

Alias to *Nos\User\Model\_Role::checkPermission* with \$allow\_empty = true.

Nos\User\Model\_Role::checkPermissionExists (\$permission\_name, \$category\_key = null, \$allow\_empty = false)

Alias to *Nos\User\Model\_Role::checkPermission*.

Nos\User\Model\_Role::checkPermissionExistsOrEmpty (\$permission\_name, \$category\_key = null, \$allow\_empty = false)

Alias to *Nos\User\Model\_Role::checkPermission* with \$allow\_empty = true.

**static** Nos\User\Model\_Role::checkPermissionIsAllowed (\$permission\_name, \$allow\_empty = false)

Check against a binary permission (without categories).

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission
- **\$allow\_empty** (*bool*) – Should we grant access when nothing is configured?

**Returns** **bool** true or false

---

```
Nos\User\Model_Role::checkPermissionAtLeast ($permission_name, $threshold,
                                         $value_when_empty = 0)
```

Check against a numeric / range permission.

You can use `string` for the 2nd and 3rd parameters, they will be casted to `(int)`. i.e. `'2_write' === 2`.

#### Parameters

- `$permission_name (string)` – Name of the permission
- `$threshold (int)` – Minimum value to grant access
- `$value_when_empty (int)` – Default value to compare with when nothing is configured

#### Returns bool

true or false

```
Nos\User\Model_Role::checkPermissionAtMost ($permission_name, $threshold,
                                         $value_when_empty = 0)
```

Check against a numeric / range permission.

You can use `string` for the 2nd and 3rd parameters, they will be casted to `(int)`. i.e. `'2_write' === 2`.

#### Parameters

- `$permission_name (string)` – Name of the permission
- `$threshold (int)` – Maximum value to grant access
- `$value_when_empty (int)` – Default value to compare with when nothing is configured

#### Returns bool

true or false

```
Nos\User\Model_Role::getPermissionValue ($permission_name, $default = 0)
```

Retrieve the value of a given permission.

#### Parameters

- `$permission_name (string)` – Name of the permission
- `$default (mixed)` – Default value to return when the permission does not exists

#### Returns string

## Menu Models

### Model\_Menu

```
class Nos\Menu\Model_Menu
Extends Nos\Orm\Model.
```

#### Relations

```
property Nos\Menu\Model_Menu::$items
```

- Relation type: `has_many`.
- Model: `Model_Menu_Item`

#### Behaviours

- `Twinnable`

## Methods

Nos\Menu\Model\_Menu::html (array \$params = array())

### Parameters

- **\$params** (array) – the parameters array:

**view** The view path to use. Default: noviusos\_menu::menu

**Returns** A View forged with \$params

Nos\Menu\Model\_Menu::branch (\$parent = null)

### Parameters

- **\$parent** (mixed) – If null, return the root branch. Can be a Model\_Menu\_Item, then return his branch.

**Returns** Array of Model\_Menu\_Item

**static** Nos\Menu\Model\_Menu::buildFromPages (\$context, \$page\_id = null, \$depth = -1)

Build a Model\_Menu where items reproduce the pages tree of the context.

### Parameters

- **\$context** (string) – The context ID
- **\$page\_id** (mixed) – The root page ID, can be null
- **\$depth** (int) – The depth of the menu. Default: -1, unlimited.

**Returns** Array of Model\_Menu\_Item

## Model\_Menu\_Item

class Nos\Menu\Model\_Menu\_Item

Extends Nos\Orm\Model.

## Relations

**property** Nos\Menu\Model\_Menu\_Item::\$parent

- Relation type: belongs\_to.
- Model: Model\_Menu\_Item

**property** Nos\Menu\Model\_Menu\_Item::\$children

- Relation type: has\_many.
- Model: Model\_Menu\_Item

**property** Nos\Menu\Model\_Menu\_Item::\$menu

- Relation type: belongs\_to.
- Model: Model\_Menu

## Methods

Nos\Menu\Model\_Menu\_Item::html (array \$params = array())

### Parameters

- **\$params** (array) – Parameters array use by driver to renderer the item

**Returns** HTML representation of the item

Nos\Menu\Model\_Menu\_Item::driver (\$reload = false)

### Parameters

- **\$reload** (bool) – If true, reload the menu item driver

**Returns** The Nos\Menu\Menu\_Item\_Driver instance of the item

## Model\_Template\_Variation

```
class Nos\Template\Variation\Model_Template_Variation
    Extends Nos\Orm\Model.
```

### Relations

**property** Nos\Template\Variation\Model\_Template\_Variation::\$**pages**

- Relation type: *has\_many*.
- Model: *Nos\Page\Model\_Page*

### Providers

**property** Nos\Template\Variation\Model\_Template\_Variation::\$**menus**

- Model: *Nos\Menu\Model\_Menu*

### Behaviours

- *Contextable*
- *Author*

### Methods

```
Nos\Template\Variation\Model_Template_Variation::configCompiled($reload      =
false)
```

#### Parameters

- **\$reload** (*bool*) – If true, reload the variation config

**Returns** Returns the configuration array of the template variation.

```
Nos\Template\Variation\Model_Template_Variation::templateConfig()
```

**Returns** Returns the configuration array of the template use by the variation.

```
static Nos\Template\Variation\Model_Template_Variation::getTemplateVariationDefault($context)
```

#### Parameters

- **\$context** (*string*) – The context ID

**Returns** The default *Model\_Template\_Variation* for this context

## Model\_Wysiwyg

```
class Nos\Model_Wysiwyg
    Extend Nos\Orm\Model.
```

### Columns

**wysiwyg\_id** Model\_Wysiwyg primary key.

**wysiwyg\_join\_table** DB table name of the model which the wysiwyg is linked to.

**wysiwyg\_foreign\_id** ID of the model which the wysiwyg is linked to.

**wysiwyg\_foreign\_context\_common\_id** Common ID of the model which the wysiwyg is linked to.

**wysiwyg\_key** string key identifying the linked wysiwyg.

**wysiwyg\_text** Wysiwyg content.

One of `wysiwyg_foreign_id` and `wysiwyg_foreign_context_common_id` columns is NULL for each row.

## Model\_Content\_Nuggets

**class** Nos\Model\_Content\_Nuggets

Extends [Nos\Orm\Model](#).

### Constants

**constant** Nos\Model\_Content\_Nuggets::**DEFAULT\_CATCHER**

Default value for the `content_catcher` column.

### Columns

**content\_id** Model\_Content\_Nuggets primary key.

**content\_catcher** Data catcher name.

**content\_model\_name** Name of the model this content nuggets originates from.

**content\_model\_id** ID of the model this content nuggets originates from.

**content\_data** The content nuggets. Stored as a serialized associative array.

## 1.1.6 Behaviours

### Author

**class** Nos\Orm\_Behaviour\_Author

Keeps track of who created an item and who updated it. Great to use in combination of `Observer_CreatedAt` and `Observer_UpdatedAt`.

### Configuration

**property** Nos\Orm\_Behaviour\_Author::\$**created\_by\_property**

Column used to store the user ID when the item is created. Its data type must be `unsigned int`.

**property** Nos\Orm\_Behaviour\_Author::\$**updated\_by\_property**

Column used to store the user ID when the item is updated (also used upon creation). Its data type must be `unsigned int`.

## Example

```
<?php

class Model_Page extends \Nos\Orm\Model
{
    protected static $_properties = array(
        // ...
        'page_created_by_id' => array(
            'default' => null,
            'data_type' => 'int unsigned',
            'null' => true,
            'convert_empty_to_null' => true,
        ),
        'page_updated_by_id' => array(
            'default' => null,
            'data_type' => 'int unsigned',
            'null' => true,
            'convert_empty_to_null' => true,
        ),
    );
}

protected static $_behaviours = array(
    'Nos\Orm_Behaviour_Author' => array(
        'created_by_property' => 'page_created_by_id',
        'updated_by_property' => 'page_updated_by_id',
    ),
);
}
```

## Contextable

**class Nos\Orm\_Behaviour\_Contextable**

Allows a *Nos\Orm\Model* to be bound to a context.

**See also:**

Multi-Contexts.

## Configuration

**property Nos\Orm\_Behaviour\_Contextable::\$context\_property**

Required. Column used to store the item's context. Its data type must be varchar (25).

**property Nos\Orm\_Behaviour\_Contextable::\$default\_context**

Default context to use if not set when creating an item.

## Methods

*Nos\Orm\_Behaviour\_Contextable::get\_context()*

**Returns** The item's context.

### Other

This behaviour extends `Model->find()`.

Add option to where array passed to method: you can use the context key as an alias to search in the column `Orm_Behaviour_Contextable::$context_property`.

### Example

```
<?php
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Contextable' => array(
            'events' => array('before_insert'),
            'context_property' => 'form_context',
        ),
    );
}
```

### Publishable

`class Nos\Orm_Behaviour_Publishable`

Adds a publication status on a `Nos\Orm\Model`. 2 modes are available:

- Yes / No state ;
- Publication depending on start / end dates (yes / no choice remains).

### Configuration

`property Nos\Orm_Behaviour_Publishable::$publication_state_property`

Always required, both for the **yes/no** and the **date range** modes.

Column used to store the publication state. Its data type must be `int`:

- **0** means not published;
- **1** means always published;
- **2** means publication depends on a date range (when combining the 2 modes).

`property Nos\Orm_Behaviour_Publishable::$publication_start_property`

Required for **date range** mode. Column used to store the publication start date. Its data type must be `datetime`.

`property Nos\Orm_Behaviour_Publishable::$publication_end_property`

Required for **date range** mode. Column used to store the publication end date. Its data type must be `datetime`.

`property Nos\Orm_Behaviour_Publishable::$options`

`allow_publish` Callback function or array of callback functions. If any returns `false` then the item will be restricted from publication.

### Methods

`Nos\Orm_Behaviour_Publishable::published()`

**Returns** `true` or `false` depending on whether the item is currently published or not.

`Nos\Orm_Behaviour_Publishable::planificationStatus()`  
**Returns** 0 (not published), 1 (published) or 2 (scheduled).

`Nos\Orm_Behaviour_Publishable::publicationStart()`  
**Returns** the publication start date, MySQL format.

`Nos\Orm_Behaviour_Publishable::publicationEnd()`  
**Returns** the publication end date, MySQL format.

## Other

This behaviour extends `Model->find()`.

You can use the `published` key in the `where` array. Appropriate conditions will be added, according to the configuration of the behaviour. Especially useful with the **date range** mode (and start / end dates).

**CRUD form** If you're using the `standard_layout` included in Novius OS, this behaviour will automatically prepend a field in the `subtitle` section to select publication status and/or dates (according to the behaviour configuration).

## Example

```
<?php

// Yes/No state
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Publishable' => array(
            'publication_state_property' => 'page_published',
        ),
    );
}

$page = Model_Page::find(1);

if ($page->published()) {
    // Do something
}
```

```
<?php

// Date range mode (combined with Yes/No state)
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Publishable' => array(
            'publication_state_property' => 'page_published',
            'publication_start_property' => 'page_publication_start',
            'publication_end_property'   => 'page_publication_end',
        ),
    );
}
```

## Sharable

```
class Nos\Orm_Behaviour_Sharable
    Adds the sharable behaviour on a Nos\Orm\Model.
```

### Configuration

```
property Nos\Orm_Behaviour_Sharable::$data
```

Associative array of different types of data forming a content nuggets.

- Keys can be one of *DataCatcher* constants.
- Values are associative array.

**value** A column name or a closure. See *Examples*.

**useTitle** Help label indicate which property of item is use as default value.

**options** Associative array of different options. Only for *DataCatcher::TYPE\_URL*.

**possibles** Associative array of possibles values. Only for *DataCatcher::TYPE\_IMAGE*.

### Methods

```
Nos\Orm_Behaviour_Sharable::get_default_nuggets()
```

**Returns** Array containing the default content nuggets of an item.

```
Nos\Orm_Behaviour_Sharable::get_catcher_nuggets ($catcher = Model_Content_Nuggets::DEFAULT_CATCHER)
```

#### Parameters

- **\$catcher** (*string*) – Data catchers ID.

**Returns** The Model\_Content\_Nuggets of this item for the specified data catcher.

```
Nos\Orm_Behaviour_Sharable::get_sharable_property ($property = null, $default = null)
```

#### Parameters

- **\$property** (*string*) – A property name.
- **\$default** (*string*) – A default value if data property is null.

**Returns** *Orm\_Behaviour\_Sharable::\$data* if \$property is null. Otherwise, property value with default fallback.

```
Nos\Orm_Behaviour_Sharable::dataCatchers()
```

Retrieves all the data catchers that can use the content nugget of this item (checks the required\_data of a data catcher and ).

**returns** All the valid data catchers for this item (keys are the data catcher names).

```
Nos\Orm_Behaviour_Sharable::possibleMedias()
```

Retrieves all possible medias that can be associated with the item. Search for linked medias and images inserted in the WYSIWYGs.

**returns** Associative array of all Model\_Media, Model\_Media ID in keys, of item.

```
Nos\Orm_Behaviour_Sharable::get_nugget_content ($catcher)
```

Retrieves the personalised content nugget of a data catcher, merged with the default content nugget of the item.

**param string \$catcher** Data catchers ID.

**returns** Array A content nugget.

## Examples

### A column for the default value

```
<?php
array(
    \Nos\DataCatcher::TYPE_TITLE => array(
        'value' => 'monk_name',
    ),
);
```

### A closure which returns a default value

```
<?php
array(
    \Nos\DataCatcher::TYPE_TITLE => array(
        'value' => function($monkey) {
            return $monkey->monk_name;
        },
    ),
);
```

**Real example** From the Monkey example application. config/model/monkey.config.php (we're using a config file here, because we can't put functions in a class property):

```
<?php

return array(
    'behaviours' => array(
        'Nos\Orm_Behaviour_Sharable' => array(
            'data' => array(
                \Nos\DataCatcher::TYPE_TITLE => array(
                    'value' => 'monk_name',
                    'useTitle' => ___('Use monkey name'),
                ),
                \Nos\DataCatcher::TYPE_URL => array(
                    'value' => function($monkey) {
                        $urls = $monkey->urls();
                        if (empty($urls)) {
                            return null;
                        }
                        reset($urls);

                        return key($urls);
                    },
                    'options' => function($monkey) {
                        return $monkey->urls();
                    },
                ),
            ),
        ),
    ),
);
```

```
        ),
        \Nos\DataCatcher::TYPE_TEXT => array(
            'value' => function($monkey) {
                return $monkey->monk_summary;
            },
            'useTitle' => __('Use monkey summary'),
        ),
        \Nos\DataCatcher::TYPE_IMAGE => array(
            'value' => function($monkey) {
                $possible = $monkey->possible_medias();

                return Arr::get(array_keys($possible), 0, null);
            },
            'possibles' => function($monkey) {
                return $monkey->possible_medias();
            },
        ),
    ),
),
);
```

## Sortable

**class** Nos\Orm\_Behaviour\_Sortable  
    Makes a Nos\Orm\Model sortable.

## Configuration

**property** Nos\Orm\_Behaviour\_Sortable:::\$sort\_property  
Required. Column name use for save sort index. Column must have type double.

**property** Nos\Orm\_Behaviour\_Sortable:::\$sort\_order  
ASC (default) ou DESC

**property** Nos\Orm\_Behaviour\_Sortable:::\$sort\_twins  
True by default. If false and the model is twinnable, the sorting won't be common to all contexts.

## Methods

Nos\Orm Behaviour Sortable::**move before** (\$item)

### Parameters

- **\$item** (*Model*) – Moves the current item before this one.

Nos\Orm Behaviour Sortable::move\_after(\$item)

Parameters

- **\$item** (*Model*) – Moves the current item after this one.

Nos\Orm Behaviour Sortable::**move to last position()**

Moves the current item to the last position (of its siblings).

## Example

```
<?php
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Sortable' => array(
            'events' => array('after_sort', 'before_insert'),
            'sort_property' => 'page_sort',
        ),
    );
}

$page_1 = Model_Page::find(1);
$page_2 = Model_Page::find(2);

$page_2->move_after($page_1);
```

## Tree

**class Nos\Orm\_Behaviour\_Tree**

Makes a *Nos\Orm\Model* behaves like a Tree.

An item can then have a parent and children (all of the same Model).

### Configuration

**property Nos\Orm\_Behaviour\_Tree::\$parent\_relation**  
Required. Name of the parent *relation*.

**property Nos\Orm\_Behaviour\_Tree::\$children\_relation**  
Required. Name of the children *relation*.

**property Nos\Orm\_Behaviour\_Tree::\$level\_property**  
Column used to store the item's depth inside the tree. Data type must be int.

### Method

**Nos\Orm\_Behaviour\_Tree::get\_parent()**  
**Returns** Model parent item, if it exists, null otherwise.

**Nos\Orm\_Behaviour\_Tree::set\_parent (\$new\_parent)**  
Set a new parent for the item.

If the item is *twinable* and if it exists in several contexts, all contexts will be moved synchronously.

#### Parameters

- **\$new\_parent (Model)** – New parent Model of the item (use null to remove the parent).

**Throws** Exception when:

- the item is moved in its own tree ;

- the item is `twinnable` and its parent does not exist in one of the contexts of the current item.

`Nos\Orm_Behaviour_Tree::find_children($where = array(), $order_by = array(), $options = array())`

**Returns** All direct children of item.

Children can be filter and / or sort by parameters.

This method use native method `Model->find()`.

\$options parameter are passed to `->find()` like that:

```
<?php
$options = \Arr::merge($options, array(
    'where' => $where,
    'order_by' => $order_by,
));
```

`Nos\Orm_Behaviour_Tree::find_children_recursive($include_self = true)`

**Parameters**

- `$include_self (boolean)` – If true, include current item in return.

**Returns** All children of item and their descendants.

`Nos\Orm_Behaviour_Tree::find_root()`

**Returns** First ascendant of item in tree or null if item has no parent.

## Other

This behaviour extends `Model->find()`.

Add option to where array passed to method : you can use parent key as alias for search in `Orm_Behaviour_Tree::$parent_relation` relation.

## Example

```
<?php
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Tree' => array(
            'events' => array('before_query', 'after_delete'),
            'parent_relation' => 'parent',
            'children_relation' => 'children',
            'level_property' => 'page_level',
        ),
    );

    protected static $_has_many = array(
        'children' => array(
            'key_from'      => 'page_id',
            'model_to'      => 'Nos\Model_Page',
            'key_to'        => 'page_parent_id',
        )
    );
}
```

```

        'cascade_save' => false,
        'cascade_delete' => false,
    ) ,
);

protected static $_belongs_to = array(
    'parent' => array(
        'key_from' => 'page_parent_id',
        'model_to' => 'Nos\Model\Page',
        'key_to' => 'page_id',
        'cascade_save' => false,
        'cascade_delete' => false,
    ) ,
);

}

```

## Twinnable

`class Nos\Orm_Behaviour_Twinnable`

Extends `Nos\Orm_Behaviour_Contextable`.

It adds the ability to twin together different items with different contexts.

- Multi-Contexts.
- `Nos\Orm_Behaviour_Contextable` for configuration and methods.

## Configuration

**property** `Nos\Orm_Behaviour_Twinnable::$common_id_property`

Required. Column used to store the common ID between twinned items. Data type must be `int`.

**property** `Nos\Orm_Behaviour_Twinnable::$is_main_property`

Required. Column used to store if the item is the main item among twin items. Data type must be `boolean`.

**property** `Nos\Orm_Behaviour_Twinnable::$common_fields`

Array of fields which are common to all context twins.

## Providers

This behaviour adds 2 *providers* to link WYSIWYGs and medias to context twins.

**property** `Nos\Orm_Behaviour_Twinnable::$shared_medias_context`

Provider for `Nos\Media\Model\Link` linked to context twins.

```

<?php
$item->shared_medias_context->avatar; // Get a Model_Link named 'avatar'
$item->shared_medias_context->avatar->media; // Get Model_Media named 'avatar'

$item->shared_medias_context->cv = $Model_Media; // Attach a Model_Media named 'cv'

$item->shared_medias_context->cv = null; // Detach a media from items context twins
// or
unset($item->shared_medias_context->cv);

```

**property** Nos\Orm\_Behaviour\_Twinnable:::\$shared\_wysiwygs\_context

Provider for *Nos\Model\_Wysiwyg* linked to context twins.

```
<?php
$item->shared_wysiwygs_context->content; // Get a Model_Wysiwyg named 'content'
$item->shared_wysiwygs_context->content->wysiwyg_text; // Get content of Model_Wysiwyg named 'content'

$item->shared_wysiwygs_context->summary = 'foo'; // Set a Model_Wysiwyg named 'content', with content 'foo'

$item->shared_wysiwygs_context->summary = null; // Remove a wysiwyg from items context twins
// or
unset($item->shared_wysiwygs_context->summary);
```

## Methods

**static** Nos\Orm\_Behaviour\_Twinnable:::hasCommonFields

**Returns** True if model has common fields, medias or WYSIWYGs.

**static** Nos\Orm\_Behaviour\_Twinnable:::isCommonField(\$name)

**Parameters**

- **\$name** (string) – The field name to check.

**Returns** True if the field name is a common field or, media or WYSIWYG.

Nos\Orm\_Behaviour\_Twinnable:::delete\_all\_context()

Removes all items twinned to the current item, including the current item itself.

Nos\Orm\_Behaviour\_Twinnable:::is\_main\_context()

**Returns** True if item is the main among twin items.

Nos\Orm\_Behaviour\_Twinnable:::find\_context(\$context)

**Parameters**

- **\$context** (mixed) – Can be
  - Array of contexts ID.
  - all, to receive all contexts.
  - Context ID.
  - main, to receive main twin item.

**Returns** A twinned item, or an array of twinned items, null or array() if none.

Nos\Orm\_Behaviour\_Twinnable:::find\_main\_context()

**Returns** The main item among the twins.

Alias for `->find_context('main')`.

Nos\Orm\_Behaviour\_Twinnable:::find\_other\_context(\$filter = array())

**Parameters**

- **\$filter** (array) – Array of contexts ID. If set, return only twin items which the context belongs to array \$filter.

**Returns** Array of twin items, current item exclude.

Nos\Orm\_Behaviour\_Twinnable:::get\_all\_context()

**Returns** Array of all twinned contexts, including the one of the current item.

Nos\Orm\_Behaviour\_Twinnable:::get\_other\_context(\$filter = array())

**Parameters**

- **\$filter** (*array*) – Array of contexts ID. If set, return only twinned contexts which belongs to array **\$filter**.

**Returns** Array of all twinned contexts ID, excluding the one of the current item.

**Nos\Orm\_Behaviour\_Twinnable::get\_possible\_context()**

**Returns** Array of possible contexts ID for current item.

**static Nos\Orm\_Behaviour\_Twinnable::findMainOrContext (\$context, array \$options = array())**

**Parameters**

- **\$context** (*mixed*) – A context ID or array of context IDs.
- **\$options** (*array*) – Array of others options like in **find()**.

**Returns** Array of items, like **find()**, either in the given context, either the main.

**See also:**

FuelPHP native **find()** method.

**Example**

```
<?php
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Twinnable' => array(
            'events' => array('before_insert', 'after_insert', 'before_save', 'after_save',
                'context_property' => 'page_context',
                'common_id_property' => 'page_context_common_id',
                'is_main_property' => 'page_context_is_main',
                'common_fields' => array(),
            ),
        );
}
```

**Urlenhancer**

**class Nos\Orm\_Behaviour\_Urlenhancer**

Used for **Nos\Orm\Model** displayed in the front-office by an *URL Enhancer*.

**Configuration**

**property Nos\Orm\_Behaviour\_Urlenhancer::\$enhancers**

Required. Array of *enhancers* ID which can generate an URL for the item.

Listed *enhancers* must define a **getUrlEnhanced(\$params)** method.

## Methods

Nos\Orm\_Behaviour\_Urlenhancer::urls (\$params = array())

### Parameters

- **\$params** (array) –

**enhancer** Specify *enhancer* ID. Restricts the search to the specified *enhancer*.

### Returns

Associative array of all possible URLs for this item

- key : page\_id::item\_slug. item slug is the URL part generate by *enhancer*.
- value : Absolute URL.

Nos\Orm\_Behaviour\_Urlenhancer::url (\$params = array())

### Parameters

- **\$params** (array) – See *Orm\_Behaviour\_Urlenhancer::urls*.

**canonical** If true, return canonical URL of item.

**preview** If true, return even unpublished URL of item.

**Returns** Absolute URL of item or null if item can't be displayed in front.

Nos\Orm\_Behaviour\_Urlenhancer::url\_canonical (\$params = array())

### Parameters

- **\$params** (array) – See *Orm\_Behaviour\_Urlenhancer::url*.

**Returns** Absolute canonical URL of item or null if item can't be displayed in front.

Alias for ->url(array('canonical' => true)).

If the item is *sharable*, returns the URL set in the shared data (content nugget).

Nos\Orm\_Behaviour\_Urlenhancer::preview\_url()

**Returns** Absolute canonical URL of item, even if it's not published, or null if item can't be displayed in the front-office.

Alias for ->url\_canonical(array('preview' => true)).

Nos\Orm\_Behaviour\_Urlenhancer::deleteCacheItem()

Delete the cache of the pages containing this item only (this will not delete the cache for the whole enhancer).

Nos\Orm\_Behaviour\_Urlenhancer::deleteCacheEnhancer()

Delete the cache of the pages containing an URL enhancer for the item. Warning: this will delete for all the enhancer, not only the pages containing the item.

Nos\Orm\_Behaviour\_Urlenhancer::htmlAnchor (\$attributes = array())

### Parameters

- **\$attributes** (array) –

Array of attributes to be applied to the anchor tag.

If key 'href' is set in \$attributes parameter:

- if is a string, used for href attribute
- if is an array, used as argument of ->url() method

If key 'text' is set in \$attributes parameter, its value replace item title

**Returns** Returns an HTML anchor tag with, by default, item URL in href and item title in text.

### Example

```
<?php
class Model_Monkey extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Urlenhancer' => array(
            'enhancers' => array('noviusos_monkey'),
        ),
    );
}
```

### Virtualname

`class Nos\Orm_Behaviour_Virtualname`

Adds a slug property to item.

The slug is automatically generated based on the `title_property` of the model if it is not specified.

If `Orm_Behaviour_Virtualname::$unique` is set, `->save()` method can throw an Exception if slug already in use.

### Configuration

**property** `Nos\Orm_Behaviour_Virtualname::$virtual_name_property`  
Required. Column used to store the slug.

**property** `Nos\Orm_Behaviour_Virtualname::$unique`  
true, false or 'context' if uniqueness must be checked by context.

### Methods

`Nos\Orm_Behaviour_Virtualname::virtual_name($virtual_name = null)`  
Getter and setter for the virtual\_name. Setter if a \$slug is passed in parameters.

When use as setter, the new virtual name is transform to friendly slug.

#### Parameters

- `$virtual_name (string)` – The new virtual name

**Returns** The item slug.

`Nos\Orm_Behaviour_Virtualname::friendly_slug($slug)`

#### Parameters

- `$slug (string)` – A slug to clean.

**Returns** A clean slug, lowercase, without forbidden characters.

## Example

```
<?php
class Model_Monkey extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Virtualname' => array(
            'events' => array('before_save', 'after_save'),
            'virtual_name_property' => 'monk_virtual_name',
        ),
    );
}
```

## Virtualpath

**class Nos\Orm\_Behaviour\_Virtualpath**

Extends *Nos\Orm\_Behaviour\_Virtualname*.

Adds a virtual path to an item.

### See also:

*Nos\Orm\_Behaviour\_Virtualname* for configuration and methods.

## Configuration

**property Nos\Orm\_Behaviour\_Virtualpath::\$virtual\_path\_property**

Required. Column name use for save virtual path.

**property Nos\Orm\_Behaviour\_Virtualpath::\$extension\_property**

Required. If it's a string, it will be appended to the virtual path. If it's an array:

**before** String to add to extension start.

**after** String to add to extension end.

**property** Column name used to store the extension.

**property Nos\Orm\_Behaviour\_Virtualpath::\$extension\_property**

Required. Name of the parent *relation* use to generate the first part of the virtual path.

## Methods

**Nos\Orm\_Behaviour\_Virtualpath::virtual\_path(\$dir = false)**

### Parameters

- **\$dir (boolean)** – If true, extension is replaced by a final /.

**Returns** Virtual path of the item.

**Nos\Orm\_Behaviour\_Virtualpath::extension()**

**Returns** Return extension part of the virtual path.

## Example

```
<?php
class Model_Page extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Orm_Behaviour_Virtualpath' => array(
            'events' => array('before_save', 'after_save', 'change_parent'),
            'virtual_name_property' => 'page_virtual_name',
            'virtual_path_property' => 'page_virtual_url',
            'extension_property' => '.html',
            'parent_relation' => 'parent',
        ),
    );
}
```

## Behaviour events

Behaviours can catch events triggered on a `Nos\Orm\Model` or on a instance of `Nos\Orm\Model`.

### Instance events

#### `dataset (&$dataset)`

Trigger when fill dataset of an item.

##### Parameters

- `$dataset (array)` – Current dataset of the item.

#### `form_fieldset_fields (&$config)`

Trigger when build a fieldset from an item.

##### Parameters

- `$config (array)` – Current fieldset configuration.

#### `form_processing ($data, &$json_response)`

Trigger when receive a form response.

##### Parameters

- `$data (array)` – Data received.
- `$json_response (array)` – JSON response to send.

#### `wysiwygOptions (&$options)`

Trigger when construct WYSIWYG options for an item.

##### Parameters

- `$options (array)` – Current option for WYSIWYG.

### Static events

#### `gridQueryConfig (&$config)`

Trigger when building a query configuration for a grid of model's items.

##### Parameters

- `$config (array)` – Configuration for the query.

New in version 4.3.

**gridQuery** (\$config, &\$query)

Trigger when building a query for a grid of model's items.

**Parameters**

- **\$config** (array) – Configuration for the query.
- **\$query** (mixed) – Current query.

**gridItem** (\$object, &\$item)

Trigger when building a grid's item.

**Parameters**

- **\$object** (mixed) – Instance of Model's item.
- **\$item** (array) – Current item in array style.

**gridAfter** (\$config, \$objects, &\$items)

Trigger after execute query for a grid of model's items.

**Parameters**

- **\$config** (array) – Configuration of the query.
- **\$objects** (array) – Array of instances of model, result of the query.
- **\$items** (array) – Current array of items in array style.

**commonConfig** (&\$config)

Trigger when building a common configuration of a model.

**Parameters**

- **\$config** (array) – Current configuration.

**crudConfig** (&\$config, \$controller)

Trigger when building the configuration of the CRUD controller of the model.

**Parameters**

- **\$config** (array) – Current configuration of the CRUD controller.
- **\$controller** (mixed) – Instance of the CRUD controller.

**crudFields** (&\$fields, \$controller)

Trigger when building the fields for the CRUD controller of the model.

**Parameters**

- **\$fields** (array) – Current fields of the CRUD controller.
- **\$controller** (mixed) – Instance of the CRUD controller.

**buildRelations** ()

Trigger when building relations of the model.

**buildProviders** ()

Trigger when building providers of the model.

**before\_query** (&\$options)

Trigger before execute a query build on the model.

**Parameters**

- **\$options** (array) – Current options for the query.

## 1.1.7 Relations

Novius OS adds relation types to FuelPHP native relations (belongs\_to, has\_one, has\_many and many\_many).

**See also:**

FuelPHP native relations.

**Twinnable Belongs To**

The `twinnable_belongs_to` relation is the equivalent of the FuelPHP native `belongs_to` relation (moreover, it extends `belongs_to`). The difference is that the link is not made on the primary key but on the context common ID.

If you use the `twinnable_belongs_to` relation, the model must implement [Twinnable behaviour](#). The field `key_from` must be declared common field in the twinnable behaviour.

Changed in version 4.2: Before the 4.2 (Dubrovka) version, the linked model also need to implement Twinnable behaviour.

**See also:**

- [Twinnable behaviour](#)
- [Multi-Contexts.](#)
- [FuelPHP native belongs\\_to](#)

**Configuration**

**key\_from** The key used for the relation in the current model.

**model\_to** The full class name of the target model. Calculated from alias.

**key\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_from** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_is\_main\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**Examples** The `Model_Monkey` belongs to a `Model_Species` independently of context. A monkey, in one context, has the same species than in other, just the translation can be changed. If the species not exists in the same context that the monkey, the relation returns the species in the main context.

```
<?php
protected static $_twinnable_belongs_to = array(
    'species' => array(
        'key_from' => 'monk_species_common_id',
        'model_to' => 'Nos\Monkey\Model_Species',
        'cascade_save' => false,
        'cascade_delete' => false,
    ),
);
```

**Twinnable Has One**

The `twinnable_has_one` relation is the equivalent of the FuelPHP native `has_one` relation (moreover, it extends `has_one`). The difference is that the link is not made on the primary key but on the context common ID.

If you use the `twinnable_has_one` relation, the model must implement [Twinnable behaviour](#).

Changed in version 4.2: Before the 4.2 (Dubrovka) version, the linked model also need to implement Twinnable behaviour.

**See also:**

- [Twinnable behaviour](#)
- [Multi-Contexts.](#)
- [FuelPHP native has\\_one](#)

## Configuration

**key\_from** Calculated from the behaviour Twinnable.

**model\_to** The full class name of the target model. Calculated from alias.

**key\_to** The key used for the relation in the linked model if `model_to` is twinnable.

**column\_context\_from** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_is\_main\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

## Twinnable Has Many

The `twinnable_has_many` relation is the equivalent of the FuelPHP native `has_many` relation (moreover, it extends `has_many`). The difference is that the link is not made on the primary key but on the context common ID.

If you use the `twinnable_has_many` relation, the model must implement [Twinnable behaviour](#).

Changed in version 4.2: Before the 4.2 (Dubrovka) version, the linked model also need to implement Twinnable behaviour.

**See also:**

- [Twinnable behaviour](#)
- [Multi-Contexts.](#)
- [FuelPHP native has\\_many](#)

## Configuration

**key\_from** Calculated from the behaviour Twinnable.

**model\_to** The full class name of the target model. Calculated from alias.

**key\_to** The key used for the relation in the linked model if `model_to` is twinnable.

**column\_context\_from** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_is\_main\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

## Twinnable Many to Many

The `twinnable_many_many` relation is the equivalent of the FuelPHP native `many_many` relation (moreover, it extends `many_many`). The difference is that the link is not made on primary keys but on context common IDs.

If you use the `twinnable_many_many` relation, the model must implement [Twinnable behaviour](#).

Changed in version 4.2: Before the 4.2 (Dubrovka) version, the linked model also need to implement Twinnable behaviour.

### See also:

- [Twinnable behaviour](#)
- [Multi-Contexts.](#)
- [FuelPHP native many\\_many](#)

## Configuration

**key\_from** The key used for the relation in the current model

**model\_to** The full class name of the target model. Calculated from alias.

**key\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**table\_through** This is the table that connects the 2 models and has both their common IDs in it.

**key\_through\_from** The key that matches the current model's common ID.

**key\_through\_to** The key that matches the related model's common ID.

**column\_context\_from** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_common\_id\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

**column\_context\_is\_main\_to** Calculated from the behaviour Twinnable if `model_to` is twinnable.

## Use

When you use the relation in a find, you can add `main_context` in conditions. If it's set to false, relation only retrieves related items of the same context.

```
<?php
Model_Example::find('all', array(
    'related' => array(
        'manymany_twinnable' => array(
            'main_context' => false,
        ),
    ),
);
```

## Attachment

Binds files to model instances. Based on the [attachment class](#).

## Configuration

**key\_from** Calculated from the primary key.

**attachment\_config** Array for attachment configuration. `dir` key is optional, calculated from model and relation names.

**See also:**

[Attachment class](#).

**Examples** In this case, each item of the model have 2 attachments: avatar and cv.

```
<?php
protected static $_attachment = array(
    'avatar' => array(),
    'cv' => array(),
);
```

## 1.1.8 Classes

### Attachment

**class Nos\Attachment**

Binds a file to an object.

#### Configuration

**property Nos\Attachment::\$attached**

Required. The attached ID.

**property Nos\Attachment::\$dir**

Required. Directory path, where the attachment is stored. Relative to `local/data/files`.

**property Nos\Attachment::\$alias**

An URL alias to access the directory path.

**property Nos\Attachment::\$extensions**

Array of valid files extensions.

**property Nos\Attachment::\$image**

If true, accepts only files with an image extension. Same that `extensions` set to `array('jpg', 'gif', 'png', 'jpeg')`.

**property Nos\Attachment::\$check**

Used it to make the attachment private. A `callback function` to check permissions against. It takes a single parameter: `Attachment` instance.

### Methods

**static Nos\Attachment::forge (\$attached, \$config)**

**Parameters**

- **\$attached (string)** – The attached ID.

- **\$config** (*mixed*) – If is a string, use it to load configuration array. Array otherwise:

```
dir Attachment::$dir
alias Attachment::$alias
extensions Attachment::$extensions
image Attachment::$image
check Attachment::$check
```

**Returns** A new `Nos\Attachment`.

`Nos\Attachment::newFile()`

**Returns** Get the new attachment file path if one, `false` if no file exists.

`Nos\Attachment::path()`

**Returns** Get the attachment file path or `false` if no file exists.

`Nos\Attachment::filename()`

**Returns** Get the attachment filename or `false` if no file exists.

`Nos\Attachment::extension()`

**Returns** Get the attachment extension or `false` if no file exists.

`Nos\Attachment::isImage()`

**Returns** True if the Attachment is an image, `false` otherwise.

`Nos\Attachment::url ($absolute = true)`

#### Parameters

- **\$absolute** (*bool*) – Default true, if false return relative URL

**Returns** Get the attachment url or `false` if no file exists.

`Nos\Attachment::urlResized ($max_width = 0, $max_height = 0, $absolute = true)`

#### Parameters

- **\$max\_width** (*array*) – Max width of the image.
- **\$max\_height** (*array*) – Max height of the image.
- **\$absolute** (*bool*) – Default true, if false return relative URL

**Returns** Get the resized url for the Attachment or `false` if no file exists or it's not an image.

`Nos\Attachment::htmlAnchor ($attributes = array())`

#### Parameters

- **\$attributes** (*array*) –

Array of attributes to be applied to the anchor tag.

If key ‘text’ is set in \$attributes parameter, its value replace attachment filename

**Returns** Returns an HTML anchor tag with, by default, attachment URL in href and attachment filename in text.

`Nos\Attachment::getToolkitImage()`

**Returns** Returns a `Nos\Toolkit_Image` based on the attachment if is an image, `False` otherwise.

`Nos\Attachment::set ($file, $filename = null)`

#### Parameters

- **\$file** (*array*) – File path

- **\$filename** (array) – File name

**Returns** Set a new Attachment file.

**Throws** FuelCoreFileAccessException if new file have a not allowed extension.

Nos\Attachment::**save**()

Save a new Attachment file

**Returns** True if the Attachment have been saved, false otherwise.

Nos\Attachment::**delete**()

Delete the Attachment file

**Returns** True if the Attachment have been deleted, false otherwise.

## Example

```
<?php

$attachment = \Nos\Attachment::forge('my_id', array(
    'dir' => 'apps'.DS.'myapps',
    'alias' => 'myapps-attachment',
    'extensions' => array('pdf'),
    'check' => 'check_attachment',
));

// It's for example
$_SESSION['user_connected'] = true;

function check_attachment($attachment) {
    return $GLOBALS['user_connected'];
}

try {
    $attachment->set('/path/a_doc.doc');
} catch (\Fuel\Core\FileAccessException $e) {
    // Exception will be throw, extension is doc, not a pdf.
}

$attachment->set('/path/a_pdf.pdf');
$attachment->save();

// Now file saved in local/data/files/apps/myapps/my_id/a_pdf.pdf

echo $attachment->url();
// Echo http://www.domain.ext/data/files/myapps-attachment/my_id/a_pdf.pdf

$_SESSION['user_connected'] = false;
// Now URL http://www.domain.ext/data/files/myapps-attachment/my_id/a_pdf.pdf return 404

$attachment->delete();
```

## Config

### class Config

Extends FuelPHP config class and provides new functionalities.

::mergeWithUser(\$key, \$config)

**static** Config::mergeWithUser (\$key, \$config)

**Parameters**

- **\$key** (*string*) – Key in which the user's configuration is saved.
- **\$config** (*mixed*) – Configuration to merge.

**Returns** The configuration merged.

Merge configuration with the one saved in user in the key *\$key*.

::getDbName(\$key)

**static** Config::getdbName (\$key)

**Parameters**

- **\$key** (*string*) – Key to be transformed.

**Returns** Valid user configuration key.

::configFile(\$class)

**static** Config::configFile (\$class)

**Parameters**

- **\$class** (*string*) – Class we want to retrieve the configuration from.

**Returns** Returns a two element array: first element is the class's application, and the second element is the relative path of the configuration file.

::metadata(\$application\_name)

**static** Config::metadata (\$application\_name)

**Parameters**

- **\$application\_name** (*string*) – Application we want to retrieve the metadata configuration from.

**Returns** The metadata configuration.

::application(\$application\_name)

**static** Config::application (\$application\_name)

**Parameters**

- **\$application\_name** (*string*) – Application we want to retrieve the global configuration from (located at *application::config*)

**Returns** The global configuration.

::actions(\$params)

**static** Config::actions (\$params = array())

**Parameters**

- **\$params** (array) – Set of filters on actions.

**models** array Models on which we retrieve actions list.

**item** object (optional) Item which we want to associate the actions with  
        (will allow to process the disabled key).

**all\_targets** boolean Specify if we want to retrieve all actions (no matter  
        target or visible value).

**target** string Which target we want to filter the actions on.

**Returns** The filtered actions.

::getActionDisabledState(\$disabled, \$item)

**static** Config::getActionDisabledState (\$disabled, \$item)

**Parameters**

- **\$disabled** (mixed) – Disabled value to be processed.

- **\$item** (object) – Item necessary to process the disabled value.

**Returns** The processed disabled value.

::processCallbackValue(\$value, \$positive\_value, \$argument\_1, \$argument\_2, ...)

**static** Config::getActionDisabledState (\$value, \$positive\_value, \$argument\_1, \$argument\_2, ...)

**Parameters**

- **\$value** (mixed) – Value to process.

• **\$positive\_value** (object) – If the value is an array of callbacks, it defines which  
    value is expected. If callback return the expected value, then we call next callback.  
    Otherwise, we return the value.

• **\$arguments** (mixed) – All appended parameters are sent to the callback functions (if  
    there is any).

**Returns** The first value which is different of \$positive\_value, otherwise \$positive\_value.

For instance:

```
<?php

// ----- With a simple value
getActionDisabledState(true, true); // returns true
getActionDisabledState(true, false); // returns true

// ----- With a callback
$value = function() {
    return true;
}

getActionDisabledState($value, true); // returns true
```

```

getActionDisabledState($value, false); // returns true

// ----- With a list of callbacks
$value = array(
    function() {
        return true;
    },
    function() {
        return false;
    }
);

getActionDisabledState($value, true); // returns false, since second callback is different from p
getActionDisabledState($value, false); // returns true, since first callback is different from p

// ----- With a list of mixed values
$value = array(
    true,
    function() {
        return false;
    }
);

// the first value is equivalent to a callback returning true, so there is no difference with p
getActionDisabledState($value, true); // returns false, since second value is different from pos
getActionDisabledState($value, false); // returns true, since first callback is different from p

// ----- With additionnal parameters
$value = array(
    function($param1, $param2) {
        return $param1 == $param2;
    },
    function ($param1, $param2) {
        return $param1 != $param2;
    }
);

getActionDisabledState($value, true, 1, 1); // returns false, since second value is different fr
getActionDisabledState($value, true, 1, 2); // returns false, since first value is different fro
getActionDisabledState($value, false, 1, 1); // returns false, since first value is different fr
getActionDisabledState($value, false, 1, 2); // returns false, since second value is different f

```

**::placeholderReplace(\$to\_be\_replaced, \$placeholders, \$remove\_unset)**

**static Config::placeholderReplace(\$to\_be\_replaced, \$placeholders, \$remove\_unset = true)**  
**Parameters**

- **\$to\_be\_replaced (mixed)** – Value to replace placeholders into. Can be a *string* or *array*.
- **\$placeholders (array)** – Associative array containing replacements.
- **\$remove\_unset (boolean)** – If set to *true*, all placeholders which have not a associated replacements are replaced by an empty string. Otherwise, they are not replaced.

**Returns** The replaced value.

::icon(\$application\_or\_model\_name, \$icon\_key)

**static Config::icon (\$application\_or\_model\_name, \$icon\_key)**  
**Parameters**

- **\$application\_or\_model\_name** (*string*) – Application or model name on which we want to retrieve the icon.
- **\$icon\_key** (*array*) – Icon size.

**Returns** The icon url.

## Front controller

**class Nos\Controller\_Front**  
Novius OS front-office controller

Use *Nos::main\_controller* to retrieve its instance and call the methods.

### Methods

**Nos\Controller\_Front::getContext ()**  
**Returns** The current context.

**Nos\Controller\_Front::getContextUrl ()**  
**Returns** Absolute URL of the current context.

**Nos\Controller\_Front::getPage ()**  
**Returns** Current Model\_Page displayed.

**Nos\Controller\_Front::getWysiwygName ()**  
**Returns** Current *wysiwyg* ID processed.

**Nos\Controller\_Front::getUrl ()**  
**Returns** Current absolute URL.

**Nos\Controller\_Front::getPageUrl ()**  
**Returns** Relative (to *Controller\_Front::getContextUrl*) URL of the current page.

**Nos\Controller\_Front::getEnhancedUrlPath ()**  
**Returns**

Relative (to *Controller\_Front::getContextUrl*) URL of the current *URL enhancer*.  
False if no current *URL enhancer*.

Same that *Controller\_Front::getPageUrl* ending with / instead of .html.

**Nos\Controller\_Front::getEnhancerUrl ()**  
**Returns**

Part of the URL processed by the *URL enhancer*.  
False if no current *URL enhancer*.

`Nos\Controller_Front::getItemDisplayed()`

**Returns** The current item displayed.

New in version 4.1.

`Nos\Controller_Front::setItemDisplayed(OrmModel $item, array $properties = array(), array $templates = array())`

**param Model \$item** The current Model instance displayed.

**param array \$properties** Array of properties

**param array \$templates** Array of templates use to set properties

New in version 4.1: Set de current item displayed, by default this item is the page displayed, but can be call by an URL enhancer. This method set automatically title, h1, meta\_description and meta\_keywords for the current HTML.

`Nos\Controller_Front::setBaseHref($base_href)`

**Parameters**

- **\$base\_href** (*string*) – Sets a new `<base href="">` for the current HTML output.

`Nos\Controller_Front::setTitle($title, $template = null)`

**Parameters**

- **\$title** (*string*) – Set a new `title` for the current HTML.
- **\$template** (*string*) – If set, use it to calculate the title. Placeholders `:title` will be replaced by `$title`, `:page_title` will be replace by the curent page title.

`Nos\Controller_Front::setH1($title, $template = null)`

**param string \$title** Set a new H1 for the current HTML.

**param string \$template** If set, use it to calculate the H1. Placeholders `:h1` will be replaced by `$h1`.

New in version 4.1.

`Nos\Controller_Front::setMetaDescription($meta_description, $template = null)`

**Parameters**

- **\$meta\_description** (*string*) – Set a meta description for the current HTML output.
- **\$template** (*string*) – If set, use it to calculate the meta\_description. Placeholders `:meta_description` will be replaced by `$meta_description`, `:page_meta_description` will be replace by the curent page meta\_description.

`Nos\Controller_Front::setMetaKeywords($meta_keywords, $template = null)`

**Parameters**

- **\$meta\_keywords** (*string*) – Set a meta keywords for the current HTML output.
- **\$template** (*string*) – If set, use it to calculate the meta\_keywords. Placeholders `:meta_keywords` will be replaced by `$meta_keywords`, `:page_meta_keywords` will be replace by the curent page meta\_keywords.

`Nos\Controller_Front::setMetaRobots($meta_robots, $template = null)`

**Parameters**

- **\$meta\_robots** (*string*) – Set a meta robots for the current HTML output.
- **\$template** (*string*) – If set, use it to calculate the meta\_robots. Placeholders `:meta_robots` will be replaced by `$meta_robots`, `:page_meta_robots` will be replace by the curent page meta\_robots.

`Nos\Controller_Front::addMeta($meta)`

**Parameters**

- **\$meta** (*string*) – A HTML meta tag to add in the current HTML output.

Nos\Controller\_Front::**addJavascript** (\$url, \$footer = true)

**Parameters**

- **\$url** (*string*) – URL of a JavaScript library to add in the current HTML output.
- **\$footer** (*boolean*) – If true, add script at the end of HTML output. If false, add in the <head>.

Nos\Controller\_Front::**addJavascriptInline** (\$js, \$footer = true)

**Parameters**

- **\$js** (*string*) – Javascript code to add in the current HTML output.
- **\$footer** (*boolean*) – If true, add at the end of HTML output. If false, add in the <head>.

Nos\Controller\_Front::**addCss** (\$url)

**Parameters**

- **\$url** (*string*) – URL of a CSS file to add in the current HTML output.

Nos\Controller\_Front::**addCssInline** (\$css)

**Parameters**

- **\$css** (*string*) – CSS code to add in the current HTML output.

Nos\Controller\_Front::**isPreview**()

**Returns** Boolean, true if current page is requested in the preview mode.

Nos\Controller\_Front::**disableCaching**()

Disable caching and cache retrieve of the current page.

Nos\Controller\_Front::**setCacheDuration** (\$cache\_duration)

**Parameters**

- **\$cache\_duration** (*int*) – Set a new cache duration of the current cache saving.

Nos\Controller\_Front::**setStatus** (\$status)

**Parameters**

- **\$cache\_duration** (*int*) – Set a new response status of the current response. This status will be saved in cache.

Nos\Controller\_Front::**setHeader** (\$name, \$value, \$replace = true)

Add or replace a header to current response. Headers will be saved in cache.

**Parameters**

- **\$name** (*string*) – The header name
- **\$value** (*string*) – The header value
- **\$replace** (*boolean*) – Whether to replace existing value for the header, will never overwrite/be overwritten when false

Nos\Controller\_Front::**getCustomData** (\$item, \$default = null)

Returns a (dot notated) custom data of the current process.

**Parameters**

- **\$item** (*string*) – Name of the custom data, can be dot notated.
- **\$default** (*mixed*) – The return value if the custom data isn't found.

**Returns** The custom data or default if not found.

`Nos\Controller_Front::setCustomData ($item, $value, $cached = false)`

Sets a (dot notated) custom data to the current process.

#### Parameters

- **\$item** (*string*) – A (dot notated) custom data key
- **\$value** (*mixed*) – The custom data value
- **\$cached** (*boolean*) – If custom data have to be cached

`Nos\Controller_Front::sendContent ($content)`

Replace the template by a specific content and stop treatments

#### Parameters

- **\$content** (*mixed*) – The new content, can be a string or a View.

`Nos\Controller_Front::addCacheSuffixHandler ($handler)`

Add a cache suffix handler for the current page

#### Parameters

- **\$handler** (*array*) – The cache suffix handler

**Returns** The cache instance if the cache path have changed, null otherwise.

## DataCatcher

```
class Nos\DataCatcher

constant Nos\DataCatcher::TYPE_TITLE
constant Nos\DataCatcher::TYPE_URL
constant Nos\DataCatcher::TYPE_TEXT
constant Nos\DataCatcher::TYPE_IMAGE
```

## FrontCache

```
class Nos\FrontCache
    Manage front cache
```

### Methods

**static** `Nos\FrontCache::callHmvcUncached ($uri, $args = array())`

Write a HMVC call in cache for after cache execution.

#### Parameters

- **\$uri** (*string*) – Route for the request.
- **\$args** (*array*) – The method parameters.

**See also:**

[Nos\Nos::hmvc](#)

**static** `Nos\FrontCache::viewForgeUncached ($file = null, $data = null, $auto_filter = null)`

Write a View forge in cache for after cache execution.

#### Parameters

- **\$file** (*string*) – The view filename
- **\$data** (*array*) – Array of values

- **\$auto\_filter** (*boolean*) – Set to true or false to set auto encoding

## I18n

**class Nos\I18n**

Provides the translation related functions.

**::setLocale()**

**static Nos\I18n::setLocale (\$locale)**

Configure the locale to use for translations.

**Parameters**

- **\$locale** (*string*) – A valid locale (en, en\_GB, en\_GB.utf-8 and en\_GB.utf-8@variant are all valid).

**::restoreLocale()**

**static Nos\I18n::restoreLocale**

Restores the previous locale.

**::load()**

**static Nos\I18n::load (\$file)**

Loads a dictionary for the current locale.

**Parameters**

- **\$file** (*string*) – Dictionary path.
- **\$group** (*string*) – Group name. Default null, use \$file.

**::get()**

**static Nos\I18n::get (\$message, \$default = null)**

Retrieves a translation from the last loaded dictionary.

**Parameters**

- **\$message** (*string*) – The message to translate.
- **\$default** (*string*) – The default text to return when the message is not found. Default value is the message itself.

**Returns** The translation or null if not founded

**::gget()**

**static Nos\I18n::gget (\$file, \$message, \$default = null)**

Retrieves a translation from a specific dictionary.

**Parameters**

- **\$file** (*string*) – Which dictionary to look into.
- **\$message** (*string*) – The message to translate.

- **\$default** (*string*) – The default text to return when the message is not found. Default value is the message itself.

**Returns** The translation or `null` if not founded

**Warning:** The dictionary must have been loaded manually before.

### ::nget()

**static** Nos\I18n::**nget** (\$singular, \$plural, \$n)

The plural version of `I18n::get`. Some languages have more than one form for plural messages dependent on the count.

#### Parameters

- **\$singular** (*string*) – The singular form of the string to be converted. Used as the key for the search in the dictionary
- **\$plural** (*string*) – The plural form
- **\$n** (*string*) – Used to determine which plural form to used depending locale.

**Returns** The translation or, if not founded, \$singular is returned if n == 1, otherwise \$plural

### ::ngget()

**static** Nos\I18n::**ngget** (\$group, \$singular, \$plural, \$n)

Retrieves a plural translation from a specific dictionary.

#### Parameters

- **\$group** (*string*) – Which dictionary to look into.
- **\$singular** (*string*) – The singular form of the string to be converted. Used as the key for the search in the dictionary
- **\$plural** (*string*) – The plural form
- **\$n** (*string*) – Used to determine which plural form to used depending locale.

**Returns** The translation or, if not founded, \$singular is returned if n == 1, otherwise \$plural

**Warning:** The dictionary must have been loaded manually before.

### ::current\_dictionary()

**static** Nos\I18n::**current\_dictionary** (\$list)

Set the current dictionary

#### Parameters

- **\$list** (*string|array*) – A dictionary file or list of dictionaries.

### ::dictionary()

**static** Nos\I18n::**dictionary** (\$files)

Returns a closure that translate messages from a specific dictionary.

### Parameters

- **\$files** (*stringarray*) – A dictionary file or list of dictionaries.

**Returns** A callable to translate a message

```
<?php

// Retrieves an anonymous function
$dictionary = Nos\I18n::dictionary('mon_appli::common');

echo $dictionary('Translate this');
```

### ::addPriorityDictionary()

**static** Nos\I18n::**addPriorityDictionary** (\$locale, \$dictionary)

Add a priority dictionary for a locale

#### Parameters

- **\$locale** (*string*) – A valid locale
- **\$dictionary** (*string*) – Dictionary path

### ::addPriorityMessages()

**static** Nos\I18n::**addPriorityMessages** (\$locale, \$messages)

Add some priorities translations for a locale

#### Parameters

- **\$locale** (*string*) – A valid locale
- **\$messages** (*array*) – An array of translations

## Menu\_Item

**class** Nos\Menu\Menu\_Item

This class is use to build *Nos\Menu\Menu\_Item\_Driver*.

**static** Nos\Menu\Menu\_Item::**forge** (\$item)

#### Parameters

- **\$item** (*mixed*) – Can be:
  - a *Nos\Menu\Model\_Menu\_Item* instance
  - a int for *Nos\Menu\Model\_Menu\_Item* ID
  - or a string for the driver name of a new *Nos\Menu\Model\_Menu\_Item* instance

**Returns** A *Nos\Menu\Menu\_Item\_Driver*, driver of the *Nos\Menu\Model\_Menu\_Item* in entrance

**static** Nos\Menu\Menu\_Item::**drivers**

**Returns** An array of all available *Nos\Menu\Menu\_Item\_Driver*. Driver name in key, driver configuration in value.

## Menu\_Item\_Driver

**class Nos\Menu\Menu\_Item\_Driver**

This is an abstract class that must be extend by all declared drivers of `Nos\Menu\Model_Menu_Item`.

To declare a driver of `Nos\Menu\Model_Menu_Item`, you have to extend the `noviusos_menu::config` configuration file.

`Nos\Menu\Menu_Item_Driver::title()`

**Returns** The title of the `Nos\Menu\Model_Menu_Item`

**static** `Nos\Menu\Menu_Item_Driver::html(array $params = array())`

By default, if the driver have a key `view` in his config, this view is forged with 2 parameters `params` and `item_driver`

If the driver have no view, build a `div` tag with `html_tag` function with `$params` and the driver title in parameters

### Parameters

- `$params (array)` – Array of parameters

**Returns** A HTML representation of the `Nos\Menu\Model_Menu_Item`

**static** `Nos\Menu\Menu_Item_Driver::config($reload = false)`

The config file is assumed to be `application_name::driver_path`.

### Parameters

- `$reload (bool)` – If `true`, reload the configuration and not use cache

**Returns array** The configuration of the driver

**See also:**

*Menu item driver configuration.*

## Migration

**class Nos\Migration**

Provides migration automation and methods useful for migrations.

### Default usage

All you need is to declare the class in the right namespace.

```
<?php

namespace Nos\Monkey\Migrations;

class Install extends \Nos\Migration
{}
```

If the migration name is `001_install.php` it will try to execute `001_install.sql`.

If you want a more complex migration (e.g. update files), you can overload up and down functions.

->up()

Nos\Migration::up()

Tries to execute a sql file with same path (if migration filename is 001\_install.php, it will try to execute 001\_install.sql).

->down()

Nos\Migration::down()

Does nothing. Need to be overloaded if you want to support this operation.

::executeSqlFile(\$sql\_file)

**static** Nos\Migration::executeSqlFile (\$sql\_file)

**Parameters**

- **\$sql\_file** (*string*) – Sql file location to be executed.

## Nos

**class** Nos\Nos

Provides static methods useful in Novius OS.

### Entry points

**property** Nos\Nos::\$entry\_point

The Novius OS entry point. Equal to one of the following constants.

**constant** Nos\Nos::ENTRY\_POINT\_ADMIN

**constant** Nos\Nos::ENTRY\_POINT\_FRONT

**constant** Nos\Nos::ENTRY\_POINT\_404

**constant** Nos\Nos::ENTRY\_POINT\_INSTALL

**constant** Nos\Nos::ENTRY\_POINT\_OIL

New in version 0.2.0.1.

::main\_controller()

**static** Nos\Nos::main\_controller

**Returns** Instance of the main *controller*.

::hmvc()

**static** Nos\Nos::hmvc (\$where, \$args = null)

**Parameters**

- **\$where** (*mixed*) – Route for the request.
- **\$args** (*array*) – The method parameters.

Executes an [HMVC](#) request.

## Permission

### **class Nos\User\Permission**

This class checks the permissions for the current logged in user.

When multiple roles are enable, if any role has the requested permission, it means the user is authorised to do it.

```
static Nos\User\Permission::check ($permission_name, $category_key = null, $allow_empty = false)
```

Alias to [Nos\User\Permission::exists](#)

```
static Nos\User\Permission::exists ($permission_name, $category_key = null, $allow_empty = false)
```

Check whether a permissions exists (against all the roles of the current logged in user).

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission to check against
- **\$category\_key** (*string*) – (optional) If the permission has categories, the category key to check against
- **\$allow\_empty** (*bool*) – (optional) Should we grant access when nothing is configured?

**Returns** **bool** true or false

```
static Nos\User\Permission::existsOrEmpty ($permission_name, $category_key = null, $allow_empty = false)
```

Alias to [Nos\User\Permission::exists](#) with the optional parameter \$allowEmpty = true.

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission to check against
- **\$category\_key** (*string*) – (optional) If the permission has categories, the category key to check against

**Returns** **bool** true or false

```
static Nos\User\Permission::isAllowed ($permission_name, $allow_empty = false)
```

Check against a binary permission (without categories) against all the roles of the current logged in user.

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission
- **\$allow\_empty** (*bool*) – Should we grant access when nothing is configured?

**Returns** **bool** true or false

```
static Nos\User\Permission::atLeast ($permission_name, $threshold, $value_when_empty = 0)
```

Check against a numeric / range permission (for all the roles of the current logged in user).

You can use *string* for the 2nd and 3rd parameters, they will be casted to *(int)*. i.e. '2\_write' === 2.

#### Parameters

- **\$permission\_name** (*string*) – Name of the permission
- **\$threshold** (*int*) – Minimum value to grant access
- **\$value\_when\_empty** (*int*) – Default value to compare with when nothing is configured

**Returns** **bool** true or false

**static** Nos\User\Permission::**atMost** (\$permission\_name, \$threshold, \$value\_when\_empty = 0)

Check against a numeric / range permission (for all the roles of the current logged in user).

You can use string for the 2nd and 3rd parameters, they will be casted to (int). i.e. '2\_write' === 2.

**Parameters**

- **\$permission\_name** (string) – Name of the permission
- **\$threshold** (int) – Maximum value to grant access
- **\$value\_when\_empty** (int) – Default value to compare with when nothing is configured

**Returns bool** true or false

**static** Nos\User\Permission::**listPermissionCategories** (\$permission\_name)

List all the categories of a given permission name (merged values from all the roles of the current logged in user).

Returns an array of string or false when access is denied, or the permission name does not exists.

**Parameters**

- **\$permission\_name** (string) – The name of the permission to retrieve categories from

**Returns array|false** An array containing the list of categories (values) for the requested permission name

**static** Nos\User\Permission::**isApplicationAuthorised** (\$application\_name)

Check whether a user can access a particular application

**Parameters**

- **\$application\_name** (string) – Name of the application :returns bool: true or false

**static** Nos\User\Permission::**contexts**

**See also:**

*Nos\Tools\_Context::contexts*

Returns an array of all the contexts the user can access.

**static** Nos\User\Permission::**locales**

**See also:**

*Nos\Tools\_Context::locales*

Returns an array of all the locales the user can access.

**static** Nos\User\Permission::**sites**

**See also:**

*Nos\Tools\_Context::sites*

Returns an array of all the sites the user can access.

## Renderer

**class Nos\Renderer**

Extends the class Fieldset\_Field of FuelPHP.

### Configuration

**property Nos\Renderer::\$DEFAULT\_RENDERER\_OPTIONS**

Static and protected. The default renderer options.

**property Nos\Renderer::\$renderer\_options**

Protected. The renderer options.

### Methods

**Nos\Renderer::setRendererOptions (\$options)**

**Parameters**

- **\$options** (array) – Options merged with current renderer options.

**static Nos\Renderer::parseOptions (\$renderer = array())**

**Parameters**

- **\$renderer** (array) – The renderer configuration.

**Returns** array 0: attributes, 1: renderer options

## Toolkit Image

**class Nos\Toolkit\_Image**

Toolkit for image manipulation.

### Usage

To get a Toolkit\_Image, use method `getToolkitImage` on classes supporting it.

- `Nos\Media\Model_Media::getToolkitImage()`
- `Nos\Attachment::getToolkitImage()`

### Methods

**Nos\Toolkit\_Image::transformations (\$transformations)**

Add multiple transformations to the image.

**Parameters**

- **\$transformations** (array) –

Transformations to add to the image.

A transformation is an array where first value is the method name, others values are method arguments.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**crop** (\$x1, \$y1, \$x2, \$y2)

Add a crop transformation to the image.

**Parameters**

- **\$x1** (*integer*) – X-Coordinate based from the top-left corner.
- **\$y1** (*integer*) – Y-Coordinate based from the top-left corner.
- **\$x2** (*integer*) – X-Coordinate based from the bottom-right corner.
- **\$y2** (*integer*) – Y-Coordinate based from the bottom-right corner.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**resize** (\$width, \$height, \$keepar = true, \$pad = false)

Resizes the image. If the width or height is null, it will resize retaining the original aspect ratio.

**Parameters**

- **\$width** (*integer*) – The new width of the image.
- **\$height** (*integer*) – The new height of the image.
- **\$keepar** (*boolean*) – Defaults to true. If false, allows resizing without keeping aspect ratio.
- **\$pad** (*boolean*) – If set to true and \$keepar is true, it will pad the image with the configured background color.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**shrink** (\$max\_width, \$max\_height)

Resizes the image only if too big

**Parameters**

- **\$max\_width** (*integer*) – The max width of the image.
- **\$max\_height** (*integer*) – The max height of the image.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**crop\_resize** (\$width, \$height)

Resizes the image. If the width or height is null, it will resize retaining the original aspect ratio.

**Parameters**

- **\$width** (*integer*) – The new width of the image.
- **\$height** (*integer*) – The new height of the image.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**rotate** (\$degrees)

Rotates the image

**Parameters**

- **\$degrees** (*integer*) – The degrees to rotate, negatives integers allowed.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::**flip** (\$direction)

Creates a vertical / horizontal or both mirror image.

**Parameters**

- **\$direction** (*string*) – vertical, horizontal, both

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::watermark (\$filename, \$position, \$padding = 5)

Adds a watermark to the image.

**Parameters**

- **\$filename** (*string*) – The filename of the watermark file to use.
- **\$position** (*string*) – The position of the watermark, ex: bottom right, center center, top left
- **\$padding** (*integer*) – The spacing between the edge of the image.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::border (\$size, \$color = null)

Adds a border to the image.

**Parameters**

- **\$size** (*integer*) – The side of the border, in pixels.
- **\$color** (*string*) – A hexidecimal color.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::mask (\$maskimage)

Masks the image using the alpha channel of the image input.

**Parameters**

- **\$maskimage** (*string*) – The location of the image to use as the mask

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::rounded (\$radius, \$sides = null, \$antialias = null)

Adds rounded corners to the image.

**Parameters**

- **\$radius** (*integer*) –
- **\$sides** (*integer*) – Accepts any combination of tl tr bl br separated by spaces, or null for all sides
- **\$antialias** (*integer*) – Sets the antialias range.

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::grayscale()

Turns the image into a grayscale version

**Returns** The current Toolkit\_Image for chaining.

Nos\Toolkit\_Image::url (\$absolute = true)

Build and return the URL of the modify image

**Parameters**

- **\$absolute** (*bool*) – Default true, if false return relative URL

**Returns** The URL of the modify image.

Nos\Toolkit\_Image::sizes()

**Returns** The dimensions of the modify image (an object containing width and height variables).

Nos\Toolkit\_Image::html (\$params = array())

Creates an html image tag of the modify image

Sets width, height, alt attributes if not supplied.

**Parameters**

- **\$params** (*array*) – The attributes array

**Returns** The image tag

Nos\Toolkit\_Image::**save**()

Apply transformations of the Image\_URL instance on a file and save it

**Returns** The save file path

Nos\Toolkit\_Image::**parse**(\$image\_url)

Parse an existing modify URL and set transformations in queue. Check if the hash part of the URL match.

**Parameters**

- **\$image\_url** (string) – Modify URL of the image

**Returns** True or false if the hash part of the URL not match.

## Example

```
<?php

$all_media_png = \Nos\Media\Model_Media::find('all', array(
    'where' => array(
        array('media_ext', 'png'),
    ),
)); // Get all images PNG in media

// Display all PNG, shrinked in 200x100, grayscale and rounded with a 5px radius, in a <img class="c
foreach ($all_media_png as $media) {
    echo $media->getToolkitImage()->shrink(200, 100)->grayscale()->rounded(5)->html(array(
        'class' => 'css_class',
    ));
}
```

## Tools\_Context

**class Nos\Tools\_Context**

Provides static methods to work with yours contexts, sites and languages.

**See also:**

Multi-Contexts

### ::contexts()

**static Nos\Tools\_Context::contexts**

**Returns** An array of all your valid contexts.

```
<?php
$contexts = \Nos\Tools_Context::contexts();
foreach ($contexts as $context_code => $context_urls) {
    // ....
}
```

### ::sites()

**static Nos\Tools\_Context::sites**

**Returns** An array of all your valid sites. Each site has a `title` and an `alias`.

```
<?php
$sites = \Nos\Tools_Context::sites();
foreach ($sites as $site_key => $site_params) {
    $title = $site_params['title'];
    $alias = $site_params['alias'];
}
```

### ::locales()

**static** Nos\Tools\_Context::**locales**

**Returns** An array of all your valid locales. Each locale has a `title` and a flag's code flag.

```
<?php
$locales = \Nos\Tools_Context::locales();
foreach ($locales as $locale_key => $locale_params) {
    $title = $locale_params['title'];
    $flag = $locale_params['flag'];
}
```

### ::defaultContext()

**static** Nos\Tools\_Context::**defaultContext**

**Returns** The code of default context of your Novius OS instance.

```
<?php
$default_context_code = \Nos\Tools_Context::defaultContext();
```

### ::locale(\$container)

**static** Nos\Tools\_Context::**locale** (\$container)

**Parameters**

- **\$container** (`string`) – A context code.

**Returns** Array of context's locale.

```
<?php
$locale = \Nos\Tools_Context::locale('main::en_GB');
$title = $locale['title'];
$code_flag = $locale['flag'];
```

### ::site(\$container)

**static** Nos\Tools\_Context::**site** (\$container)

**Parameters**

- **\$container** (`string`) – A context code.

**Returns** Array of context's site.

```
<?php
$site = \Nos\Tools_Context::site('main::en_GB');
$title = $site['title'];
$alias = $site['alias'];
```

## Tools\_RSS

**class Nos\Tools\_RSS**

Used to build a RSS feed.

### Methods

**::forge()**

**static Nos\Tools\_RSS::forge (\$channel = array(), array \$items = array())**

#### Parameters

- **\$channel (mixed)** – If it is a string, used as channel's title. Associative array otherwise;
- **\$items (array)** – Associative array. Each key will be transformed into XML tag in a `<item>`.

**Encoding** Default UTF-8. Used for the XML encoding attribute.

**Version** Default 2.0. Used for XML version attribute (`<rss>` tag).

You can define any other key, which will be transformed into XML tag in the `<channel>`

**Returns** A instance of `Tools_RSS`.

**::set()**

**Nos\Tools\_RSS::set (\$property, \$value = null)**

#### Parameters

- **\$property (mixed)** – A single string to set a channel property, or an associative array for multiple settings.
- **\$value (mixed)** – If \$property is a string, the value of the property.

Set one or multiple channel properties.

**::set\_items()**

**Nos\Tools\_RSS::set\_items (array \$items)**

#### Parameters

- **\$items (array)** – Array of items.

Set a new array of items.

**::add\_item()**

**Nos\Tools\_RSS::add\_item (array \$item)**

#### Parameters

- **\$item (array)** – An item.

Add a new item to the `$items` array.

**::build()**

Nos\Tools\_RSS::build(array \$channel = array(), array \$items = array())

**Parameters**

- **\$channel** (*mixed*) –
- **\$items** (*array*) –

**Returns** The XML description of the RSSSee [Tools\\_RSS::forge](#) for parameters.

The pubDate key can be a Fuel\\Core\\Date instance, or a string (date representation) or a timestamp.

**Examples**

```
<?php
$rss = \Nos\Tools_RSS::forge('RSS title');
$rss->set_items(array(
    'title' => 'Item title',
    'link' => 'http://www.mydomain.com/item_url.html',
    'description' => '<p>A description of item </p>',
    'pubDate' => '2012-08-16',
    'author' => 'Me',
));
$xml = $rss->build();

$rss->set('subtitle', 'A subtitle for ma RSS');
echo $rss; // Call $rss->build() with magic method __toString()
```

**Tools\_Url**

class Nos\Tools\Url

Provides static methods for URL.

**::page()**

static Nos\Tools\Url::page(\$page\_id)

**Parameters**

- **\$page\_id** (*int*) – A Model\_Page ID.

**Returns** URL of the specified page.**::context()**

static Nos\Tools\Url::context(\$context)

**Parameters**

- **\$context** (*string*) – A context ID. See [Multi-Contexts](#).

**Returns** Home URL of the specified context.

`::encodePath()`

**static** `Nos\Tools\Url::encodePath($url)`

**Parameters**

- `$url` (*string*) – Url to encode

**Returns** Encode the path part of an URL.

## Tools\_Wysiwyg

`class Nos\Tools_Wysiwyg`

Provides static methods to work with WYSIWYG.

`::parse()`

**static** `Nos\Tools_Wysiwyg::parse($content)`

**Parameters**

- `$content` (*string*) – A `Nos\Model_Wysiwyg` content.

**Returns** Prepare wysiwyg content for display.

Replace enhancers by their content.

Replace `Model_Page` and `Model_Media` IDs by theirs URLs

Wysiwyg anchors are processed in case the href attribute begin with # :

- If it begins with only one # then the href will be prefixed by the page url.
- If it begins with two ## then it is transformed to only one #.

## View

`class View`

Extends FuelPHP view class and provides new functionalities.

`__construct($file, $data, $filter)`

`View::__construct($file = null, $data = null, $filter = null)`

Same specifications as in [FuelPHP view class](#), except when you prefix the view name by !, view redirections are ignored.

`::redirect($from, $to, $callback)`

**static** `View::redirect($from, $to, $callback = true)`

**Parameters**

- `$from` (*string*) – The view to redirect from.
- `$to` (*mixed*) – The view to redirect to or callback.
- `$callback` (*mixed*) – Callback

The function can redirect views: you can, for instance, make `View::forge('a')` return the content of view `b`.

Usages examples:

```
<?php

View::redirect('a', 'b'); // redirects view `a` to `b`

View::redirect('a', 'b', function($data, $filter) { return false; }); // won't have any effect

View::redirect('a', 'b', function($data, $filter) { return false; });
View::redirect('a', 'c', function($data, $filter) { return true; });
// will redirect `a` to `c`

View::redirect('a', false, function($data, $filter) { return 'd'; })
// or
View::redirect('a', function($data, $filter) { return 'd'; })
// will redirect `a` to `d`
```

## 1.1.9 Renderers

### Date Picker

```
class Nos\Renderer_Date_Picker
Extends Nos\Renderer_Datetime_Picker.
```

Since Chiba 2.2, this renderer is just an alias of `Nos\Renderer_Datetime_Picker` with format set to date.

New in version chiba.2.2.

### Date Time Picker

```
class Nos\Renderer_Datetime_Picker

Extends Nos\Renderer.
This renderer is used to pick a date and time.
It's based on jQuery UI Date Time Picker addon.
```

## Configuration

**property Nos\Renderer\_Datetime\_Picker::\$wrapper**

HTML string to wrap the <input> + the generated image to open the datetimepicker

**property Nos\Renderer\_Datetime\_Picker::\$format**

(Default: datetime). Format saved and displayed : date or datetime

New in version chiba.2.2.

**property Nos\Renderer\_Datetime\_Picker::\$null\_allowed**

(Default: false). Set to true if the date can be null.

New in version chiba.2.3.

**property Nos\Renderer\_Datetime\_Picker::\$datetimepicker**

Options for the datepicker widget used to render the UI. See the [jQuery UI documentation](#) for all available options.

Default values below:

**showOn** both

**buttonImage** static/novius-os/admin/novius-os/img/icons/date-picker.png

**buttonImageOnly** true

**autoSize** true

**hiddenTimeFormat** HH:mm:ss

**hiddenDateFormat** yy-mm-dd

**dateFormat** HH:mm:ss

**timeFormat** HH:mm

**dateFormat** dd/mm/yy

**altFieldTimeOnly** false

**showButtonPanel** true

```

changeMonth true
changeYear true
showOtherMonths true
selectOtherMonths true
gotoCurrent true
firstDay 1
showAnim slideDown

property Nos\Renderer_Datetime_Picker::$mysql_input_format
(Datetime default: %Y-%m-%d %H:%M:%S, Date default: %Y-%m-%d). Defines how to decode input value
New in version chiba.2.2.

property Nos\Renderer_Datetime_Picker::$mysql_store_format
(Datetime default: mysql, Date default: mysql_date). Defines how to store value in the database
New in version chiba.2.2.

property Nos\Renderer_Datetime_Picker::$plugin
(Datetime default: datetimepicker, Date default: datepicker). Defines which jquery ui plugin to call on the form
input
New in version chiba.2.2.

```

## Methods

Nos\Renderer\_Datetime\_Picker::**renderer** (\$renderer)

### Parameters

- **\$renderer** (*Model*) – HTML attributes (name, class, id, value, etc.), with a special key renderer\_options

**Returns** The <input> tag with JavaScript to initialise it  
Displays a date time picker in a standalone manner.

## Example

Adding a date time picker in a CRUD form configuration:

```

<?php

return array(
    'label' => '',
    'renderer' => 'Nos\Renderer_Datetime_Picker',
    'renderer_options' => array(
        'datepicker' => array(),
        'wrapper' => '<div class="datetimepicker-customwrapper"></div>',
    ),
);

```

Displaying a date time picker:

```
<?php

echo Nos\Renderer_Datetime_Picker::renderer(array(
    'name' => 'my_datetime',
    'class' => 'some_class',
    'value' => '2013-02-13',
    'renderer_options' => array(
        'datetimepicker' => array(),
        'wrapper' => '<div class="datepicker-customwrapper"></div>',
    ),
));
```

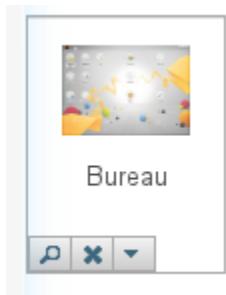

### Item Picker

```
class Nos\Renderer_Item_Picker
```

Extends *Nos\Renderer*.

This renderer is used to pick a item.

It displays a thumbnail of the item with buttons to manage the selected item

### Configuration

**property** Nos\Renderer\_Item\_Picker::\$model

The model name

**property** Nos\Renderer\_Item\_Picker::\$appdesk

URL of the model appdesk.

**property** Nos\Renderer\_Item\_Picker::\$size

Size of the thumbnail. Default 64

**property** Nos\Renderer\_Item\_Picker::\$texts

Labels use for UI

**empty** Label when no item selected. Default No item selected.

**add** Label of button to pick an item. Default Pick an item.

**edit** Label of button to pick another item. Default Pick another item.

**delete** Label of button to un-select item. Default Un-select this item.

**property** Nos\Renderer\_Item\_Picker::\$defaultThumbnail

URL of the default thumbnail

## Methods

Nos\Renderer\_Item\_Picker::**renderer** (\$renderer)

### Parameters

- **\$renderer** (*Model*) – Array the attributes.

**Returns** The <input> tag with JavaScript to initialise it  
Displays a item picker renderer in a standalone manner.

## Example

Adding a page item picker in a CRUD form configuration:

```
<?php

return array(
    'label' => __('Page:'),
    'renderer' => 'Nos\Renderer_Item_Picker',
    'renderer_options' => array(
        'model' => 'Nos\Page\Model_Page',
        'appdesk' => 'admin/noviusos_page/appdesk',
        'defaultThumbnail' => 'static/apps/noviusos_page/img/64/page.png',
        'texts' => array(
            'empty' => __('No page selected'),
            'add' => __('Pick a page'),
            'edit' => __('Pick another page'),
            'delete' => __('Un-select this page'),
        ),
    ),
);
```

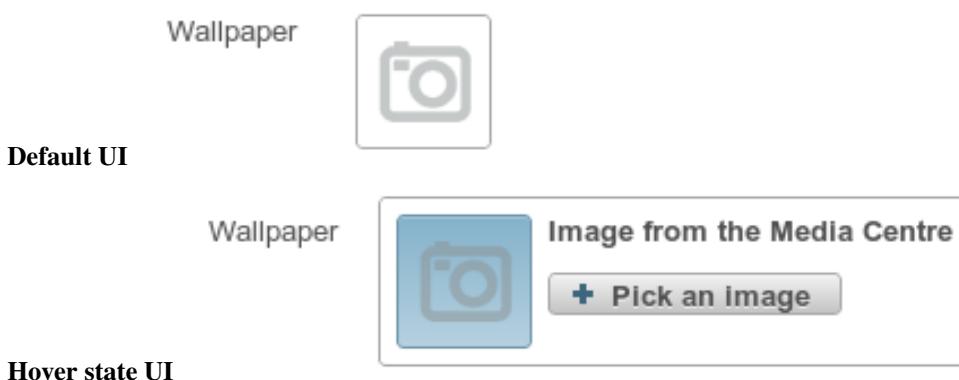

## Media Selector

class Nos\Media\Renderer\_Media

Extends *Nos\Renderer*.

This renderer is used to pick a file from the media centre.

It's based on the *jQuery UI input-file-thumb* widget.

Wallpaper

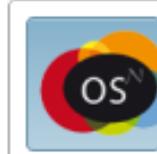

Image from the Media Centre

Pick another image

No image

Hover state with a selected media UI

## Configuration

**property** Nos\Media\Renderer\_Media::\$mode

Possible values are image (default) or all.

**property** Nos\Media\Renderer\_Media::\$inputFileThumb

Options for the inputFileThumb widget used to render the UI. See the [inputFileThumb documentation](#) for all available options.

---

**Note:** The `inputFileThumb.file` key will automatically be populated with the URL of the media if a value is provided in the renderer.

---

## Methods

Nos\Media\Renderer\_Media::renderer (\$renderer)

### Parameters

- **\$renderer (Model)** – HTML attributes (name, class, id, value, etc.), with a special key `renderer_options`

**Returns** The `<input>` tag with JavaScript to initialise it  
Displays a media selector in a standalone manner.

## Example

Adding a media in a CRUD form configuration:

```
<?php

return array(
    'label' => '',
    'renderer' => 'Nos\Media\Renderer_Media',
    'renderer_options' => array(
        'mode' => 'image',
        'inputFileThumb' => array(
            'title' => 'Title of the image',
        ),
    ),
);
```

Displaying a media selector:

```
<?php

echo Nos\Media\Renderer_Media::renderer(array(
```

```
'name' => 'my_image',
'class' => 'some_class',
'value' => 2, // ID of the previously selected media
'renderer_options' => array(
    'mode' => 'image',
    'inputFileThumb' => array(
        'title' => 'Title of the image',
    ),
),
),
));
```

## Page Selector

```
class Nos\Page\Renderer_Selector
```

Extends `Nos\Renderer`.

This renderer is used to pick a page.

It displays a tree of the pages with radio buttons.

## Configuration

```
property Nos\Page\Renderer_Selector::$input_name
```

Name for the radio input.

```
property Nos\Page\Renderer_Selector::$multiple
```

Set to true if you want to select multiple pages. Default false.

```
property Nos\Page\Renderer_Selector::$selected
```

An array, or an array of array iff `multiple` is true, containing:

`id` Pre-selected page id (value).

```
model Nos\Page\Model_Page
```

```
property Nos\Page\Renderer_Selector::$treeOptions
```

Array

**Context** Context of the pages displayed in the page selector.

**property** Nos\Page\Renderer\_Selector::\$height  
Height of the renderer. Default is 150px.

**property** Nos\Page\Renderer\_Selector::\$width  
Width of the renderer. Default is none.

## Methods

Nos\Page\Renderer\_Selector::renderer(\$renderer)

**Parameters**

- **\$renderer** (*Model*) – Array the attributes.

**Returns** The <input> tag with JavaScript to initialise it  
Displays a page selector renderer in a standalone manner.

## Example

Adding a page in a CRUD form configuration:

```
<?php

return array(
    'label' => __('Location:'),
    'renderer' => 'Nos\Page\Renderer_Selector',
    'renderer_options' => array(
        'height' => '250px',
    ),
);
```

Displaying a media selector:

```
<?php

echo Nos\Page\Renderer_Selector::renderer(array(
    'input_name' => 'my_page',
    'selected' => array(
        'id' => 2, // ID of the previously selected page
    ),
    'treeOptions' => array(
        'context' => 'main::en_GB',
    ),
    'height' => '250px',
));
```

## Set of radio buttons

**class** Nos\Renderer\_Radioset

Extends *Nos\Renderer*.

This renderer is used to display a set of radio buttons.

Status:  Refused

## Configuration

**property** Nos\Renderer\_Radioset::\$name

Name for the radio input.

**property** Nos\Renderer\_Radioset::\$choices

List of radio buttons. Key is the value and value is an array.

**label** Text or image to display around the radio button

**side\_label** Text on the side for the selected option

**property** Nos\Renderer\_Radioset::\$value

Value of the selected input.

**property** Nos\Renderer\_Radioset::\$class

Class for the container div.

## Example

Adding set of radio button in a CRUD form configuration:

```
<?php
```

```
return array(
    'label' => __('Status:'),
    'renderer' => '\Nos\Renderer_Radioset',
    'renderer_options' => array(
        'choices' => array(
            'refused' => array(
                'label' => '',
                'side_label' => __('Refused'),
            ),
            'pending' => array(
                'label' => '',
                'side_label' => __('Pending'),
            ),
            'published' => array(
                'label' => '',
                'side_label' => __('Published'),
            ),
        ),
        'class' => 'flat',
    ),
);
```

## Select Model

**class** Nos\Renderer\_Select\_Model

Extends *Nos\Renderer*.

This renderer is used to display a select tag fill with items from a model.

This renderer manage automatically behaviours `Twinnable` and `Twinnable`.  
The select is refresh automatically if an item of the model is created, saved or deleted.

## Configuration

**property** `Nos\Renderer_Select_Model::$model`  
The name of the model

**property** `Nos\Renderer_Select_Model::$multiple`  
Set to true if you want to select multiple items. Default false.

**property** `Nos\Renderer_Select_Model::$empty_option`  
Set to true if you want an empty option in select. Default true.

**property** `Nos\Renderer_Select_Model::$choose_label`  
The label of the empty option. Default empty.

## Example

Adding a select model on page in a CRUD form configuration:

```
<?php

return array(
    'label' => __('Location:'),
    'renderer' => 'Nos\Renderer_Select_Model',
    'renderer_options' => array(
        'model' => 'Nos\Page\Model_Page',
    ),
);
```

## Tag

**class** `Nos\Renderer_Tag`

Extends `Nos\Renderer`.

This renderer is used to add tags on an item.

It's based on [jQuery UI Tag-it](#).

### Tags

## Configuration

Any options for the jQuery UI Tag-it widget. See the [documentation](#) for all available options.

## Example

Adding a tags editor in a CRUD form configuration:

```
<?php

return array(
    'label' => '',
    'renderer' => 'Nos\Renderer_Tag',
    'renderer_options' => array(
        'model'      => 'Model_Tag',
        'label_column' => 'tag_label',
        'relation_name' => 'tags'
    ),
);
```

## Text

**class Nos\Renderer\_Text**

This renderer will show the value of the field as plain-text.

## Example

Adding a text in a CRUD form configuration:

```
<?php

return array(
    'label' => '',
    'renderer' => 'Nos\Renderer_Text',
);
```

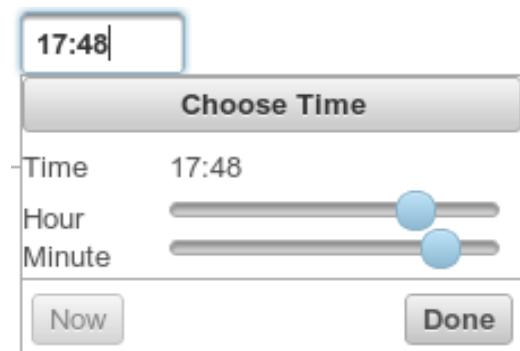

## Time Picker

**class Nos\Renderer\_Time\_Picker**

Extends *Nos\Renderer*.

This renderer is used to pick a time.

It's based on [jQuery UI Time Picker](#).

## Configuration

All the `jQuery UI Time Picker` options can be used.

## Methods

`Nos\Renderer_Time_Picker::renderer ($renderer)`

### Parameters

- `$renderer (Model)` – HTML attributes (name, class, id, value, etc.), with a special key `renderer_options`

**Returns** The `<input>` tag with JavaScript to initialise it

Displays a time picker in a standalone manner.

## Example

Adding a time picker in a CRUD form configuration:

```
<?php

return array(
    'label' => '',
    'renderer' => 'Nos\Renderer_Time_Picker',
    'renderer_options' => array(
        // jQuery UI Time Picker options
    ),
);
```

Displaying a time picker:

```
<?php

echo Nos\Renderer_Time_Picker::renderer(array(
    'name' => 'my_time',
    'class' => 'some_class',
    'value' => '17:48',
    'renderer_options' => array(
        // jQuery UI Time Picker options
    ),
));
```

## Virtual name

`class Nos\Renderer_Virtualname`

Extends `Nos\Renderer`.

This renderer is used for modify an item slug.

### See also:

`NosOrm_Behaviour_Virtualname`

URL: \*

.html

Use title

## Example

Adding a Virtual name in a CRUD form configuration:

```
<?php  
  
return array(  
    'label' => '',  
    'renderer' => 'Nos\Renderer_Virtualname',  
);
```

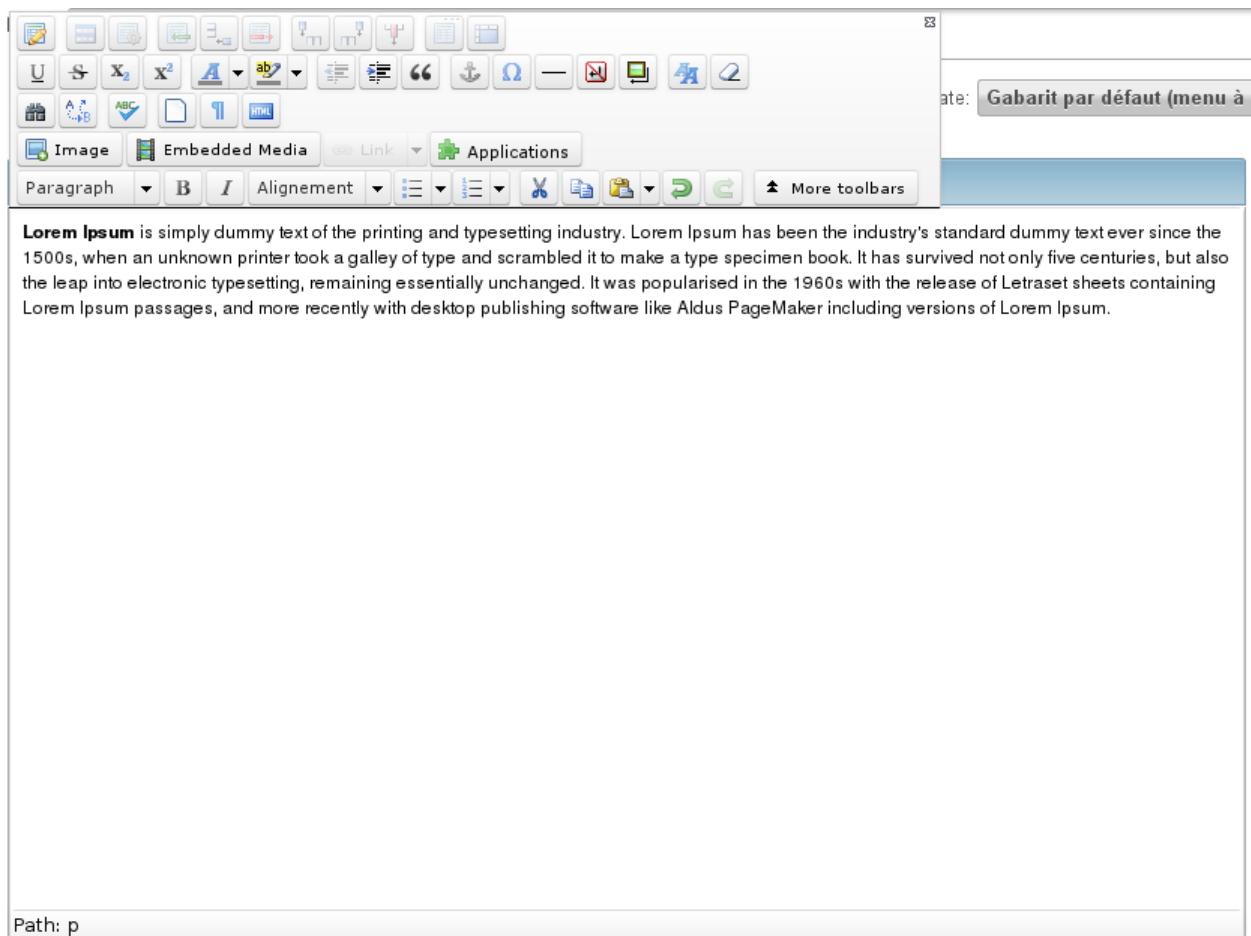

## WYSIWYG

**class Nos\Renderer\_Wysiwyg**

Extends *Nos\Renderer*.

This renderer is used to display a WYSIWYG editor.

It's based on [TinyMCE](#).

## Configuration

Any options for the TinyMCE WYSIWYG editor. See the [TinyMCE documentation](#) for all available options.

## Methods

Nos\Renderer\_Wysiwyg::**renderer** (\$renderer)

### Parameters

- **\$renderer** (*Model*) – HTML attributes (name, class, id, value, etc.), with a special key `renderer_options`

**Returns** The `<textarea>` tag with JavaScript to initialise it  
Displays a TinyMCE WYSIWYG editor in a standalone manner.

## Example

Adding a WYSIWYG in a CRUD form configuration:

```
<?php
```

```

return array(
    'label' => '',
    'renderer' => 'Nos\Renderer_Wysiwyg',
    'renderer_options' => array(
        // TinyMCE options
    ),
) ;

```

Displaying a WYSIWYG editor:

```

<?php

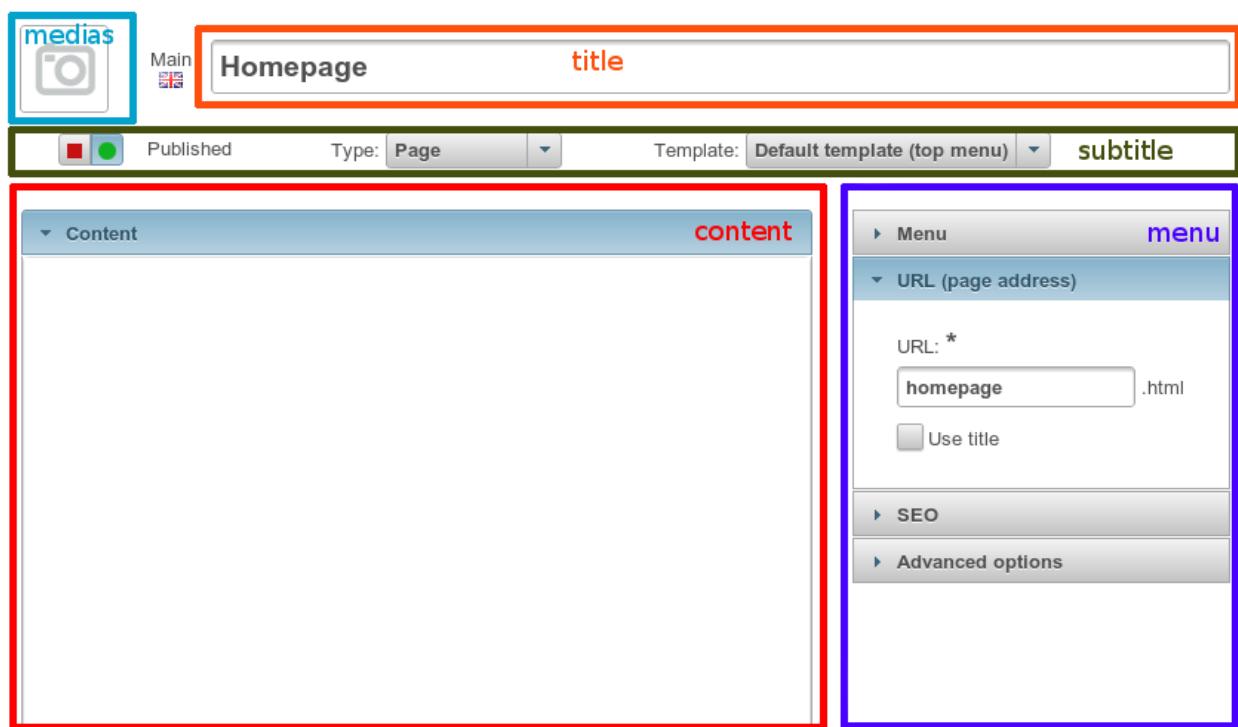

echo Nos\Renderer_Wysiwyg::renderer(array(
    'name' => 'my_wysiwyg',
    'value' => '<p>My contents</p>',
    'renderer_options' => array(
        // TinyMCE options
    ),
)) ;

```

## 1.1.10 Views

### Standard layout

View path: nos::form/layout\_standard.

**Params:**

**title** Main fields at the top of the form.

**medias** Medias are shown at the left of the title.

**large** Default layout has spaces on the sides. If true, the form will use 100% of the width.

**save** Which field is the save button.

**subtitle** Fields under title.

**content** It has the same syntax as the **full** version of the *crud layout*.

**menu** Shown on the right. Data for the **accordion** view (see below). Optionally comes with an **simplified syntax**.

**Standard syntax** for the accordion:

```
array(
    'first_accordion' => array(
        'title' => __('My first accordion'),
        'fields' => array('field_1', 'field_2'),
    ),
    'second_accordion' => array(
        'title' => __('My second accordion'),
        'fields' => array('field_3', 'field_4'),
    ),
),
```

- if **title** is omitted, it will use the key as default value ;
- if **fields** is omitted, it will use the whole array as the list of fields.

(so you can't omit the **fields** if you set a **title**).

**Simplified syntax** for the accordion:

```
array(
    __('My first accordion') => array(
        'field_1',
        'field_2',
    ),
    __('My second accordion') => array(
        'field_3',
        'field_4',
    ),
),
// OR

array(
    __('My first accordion') => array(
        'fields' => array('field_1', 'field_2'),
    ),
    __('My second accordion') => array(
        'fields' => array('field_4', 'field_4'),
    ),
),
```

## Expander

View path: nos::form/expander

**See also:**

## Wijmo Expander

### Params:

- title** Expander's title.
- options** Options for the wijexpander.
- content** Either a plain *string*, a *callable*, or a *view + params* pair (array).
- show\_when\_empty** Optional. Default false. Should the expander be displayed if there is no content inside of it?

## Accordion

View path: nos::form/accordion

### See also:

## Wijmo Accordion

For each accordion, you can either set:

- a **view + params** pair ;
- or a **fields** list.

### Params:

**accordions** A list of accordions

- title** Optional. Default value is *empty string*.
- view** Optional. Path to a view.
- params** Optional. Data for the **view**.
- fields** Optional. A list of field names.
- field\_template** Optional. Template to wrap each field. Default value is  
`<p>{field}</p>`
- header\_class** Optional. CSS classes for the **<h3>** tag.
- content\_class** Optional. CSS classes for the **<div>** panel.
- show\_when\_empty** Optional. Default false. Should the panel be displayed if there is no content inside of it?

## Fields

View path: nos::form/fields

### Params:

- begin** String to display at the beginning.
- end** String to display at the end.
- fields** A list of field names.
- callback** Optional. Callback function used to render the field. By default, a field will be rendered by calling its `build()` method.
- show\_when\_empty** Optional. Default false. Should the `begin` and `end` variables be displayed if there is no content inside of it?

## Permissions standalone

View path: nos::admin/permissions/standalone

### Params:

**list** A list of permissions

**label** Label of the permission.

**checked** boolean Initial state when the permission is not set (default: false).

**permission\_name** (optional) Name of the permission. Default is to re-use this array key (see example below).

**category\_key** (optional) Category of the permission

## 1.1.11 Events

### Configuration

**config|<path>**

**config|<path> (\$config)**

A configuration file is loaded.

#### Parameters

- **&\$config (array)** – The loaded array from the file

```
<?php

// Listening to the event
Event::register_function('config|nos::controller/admin/page/page', function(&$config)
{
    // ...
}
// Triggering the event
$config = Config::load('nos::controller/admin/page/page', true);
```

Also works with absolute paths :

```
<?php

// Listening to the event
Event::register_function('config|/data/www/novius-os/local/config/test.php', function(&$config)
{
    // ...
}
// Triggering the event (file must exists)
$config = Config::load('/data/www/novius-os/local/config/test.php', true);
```

**config|<group>**

**config|<group> (\$config)**

A configuration array is loaded.

#### Parameters

- **&\$config** (*array*) – The loaded array

```
<?php

// Listening to the event
Event::register_function('config|group', function(&$config)
{
    // ...
}
// Triggering the event
Config::load(array(), 'group');
```

## Front-office (website)

### **front.start**

#### **front.start (\$params)**

An .html page is requested.

##### Parameters

- **\$params** (*array*) –

**&\$url** string Current URL (without leading domain, with trailing .html)

**&\$cache\_path** string Which entry should be checked / written in the cache

```
<?php

Event::register_function('front.start', function($params)
{
    $url = & $params['url'];
    $cache_path = & $params['cache_path'];
    // ...
});
```

### **front.parse\_wysiwyg**

#### **front.parse\_wysiwyg (\$html)**

Additional processing on a WYSIWYG (HTML content).

##### Parameters

- **\$html** (*string*) – HTML content, already pre-processed by the core

```
<?php

Event::register_function('front.parse_wysiwyg', function(&$content)
{
    // ...
});
```

## front.display

### front.display(\$html)

Additional processing on the page (HTML content).

#### Parameters

- **\$html** (string) – HTML content of the page (will be written in the cache)

```
<?php

Event::register_function('front.display', function(&$html)
{
    // ...
});
```

## front.pageFound

### front.pageFound(\$params)

Page to display have been found.

#### Parameters

- **\$params** (array) –

**\$page** Nos\Page\Model\_Page

```
<?php

Event::register('front.pageFound', function($params)
{
    $page = $params['page'];
    // ...
});
```

## front.response

### front.response(\$params)

Before that the response be sended.

#### Parameters

- **\$params** (array) –

**&\$content** string The response body

**&\$status** int The HTTP response status for this response

**&\$headers** array HTTP headers for this response

```
<?php

Event::register_function('front.response', function($params)
{
    $content =& $params['content'];
    $status = & $params['status'];
    $headers = & $params['headers'];
    // ...
});
```

**front.404NotFound****front.404NotFound(\$params)**

An .html page was requested, but not found.

**Parameters**

- **\$params** (array) –

**\$url** string Current URL (without leading domain, with trailing .html)

```
<?php

Event::register('front.404NotFound', function($params)
{
    $url = $params['url'];
    // ...
});
```

**404 entry point**

New in version 0.2.0.2.

**404.start****404.start(\$params)**

A inexistant file is requested. Can be media or attachment file.

**Parameters**

- **\$params** (array) –

**&\$url** string URL requested (without leading domain)

```
<?php

Event::register_function('404.start', function($params)
{
    $url =& $params['url'];
    // ...
});
```

**404.mediaFound****404.mediaFound(\$params)**

Media to send have been found.

**Parameters**

- **\$params** (array) –

**\$url** string The requested URL

**\$media** Nos\Media\Model\_Media

**&\$send\_file** string The path of the file to be sent

```
<?php

Event::register_function('404.mediaFound', function($params)
{
    $url = $params['url'];
    $media = $params['media'];
    $send_file =& $params['send_file'];
    // ...
});
```

## 404.mediaNotFound

### 404.mediaNotFound(\$url)

A inexistant media file is requested.

#### Parameters

- **\$url** (*string*) – URL requested (without leading domain)

```
<?php

Event::register('404.mediaNotFound', function($url)
{
    // ...
});
```

## 404.attachmentFound

### 404.attachmentFound(\$params)

Attachment file to send have been found.

#### Parameters

- **\$params** (*array*) –
  - \$url** *string* The requested URL
  - \$attachement** *Nos\Attachment*
  - &\$send\_file** *string* The path of the file to be sent

```
<?php

Event::register_function('404.attachmentFound', function($params)
{
    $url = $params['url'];
    $attachement = $params['attachement'];
    $send_file =& $params['send_file'];
    // ...
});
```

## 404.attachmentNotFound

### 404.attachmentNotFound(\$url)

A inexistant attachment file is requested.

**Parameters**

- **\$url** (*string*) – URL requested (without leading domain)

```
<?php

Event::register('404.attachmentNotFound', function($url)
{
    // ...
});
```

**404.end****404.end(\$url)**

A inexistant file is requested. No attachment or media file matched the URL.

**Parameters**

- **\$url** (*string*) – URL requested (without leading domain)

```
<?php

Event::register('404.end', function($url)
{
    // ...
});
```

**Back-office****admin.launchers****admin.launchers()**

Triggered after recuperation and before parsing of installed launchers.

**Parameters**

- **\$launchers** (*array*) – Associative array of installed launchers

```
<?php

Event::register_function('admin.launchers', function(&$launchers)
{
    // ...
});
```

New in version 4.2.

**admin.loginSuccess****admin.loginSuccess()**

A user just successfully connected to the back-office.

```
<?php

Event::register('admin.loginSuccess', function()
{
    // ...
});
```

### admin.loginFail

#### admin.loginFail()

A user is trying to connect to the back-office with an email or an invalid password.

```
<?php

Event::register('admin.loginFail', function()
{
    // ...
});
```

### admin.loginSuccessWithCookie

#### admin.loginSuccessWithCookie()

A user just successfully re-connected to the back-office using the cookie.

```
<?php

Event::register('admin.loginSuccessWithCookie', function()
{
    // ...
});
```

### admin.loginFailWithCookie

#### admin.loginFailWithCookie()

A user has failed to connect to the back-office using the cookie.

```
<?php

Event::register('admin.loginFailWithCookie', function()
{
    // ...
});
```

## Emails

### email.before\_send

#### email.before\_send(\$email)

Before sending an email.

**Parameters**

- **\$email** (*object*) – Email\_Driver instance

```
<?php

Event::register('email.before_send', function($email)
{
    // ...
})
```

**email.after\_send****email.after\_send(\$email)**

After a mail was sent.

**Parameters**

- **\$email** (*object*) – Email\_Driver instance

```
<?php

Event::register('email.after_send', function($email)
{
    // ...
})
```

**email.error****email.error(\$params)**

On email send error.

**Parameters**

- **\$params** (*object*) – Email\_Driver instance

**\$email** The email driver object

**\$exception** The exception object

```
<?php

Event::register('email.error', function($params)
{
    $email = $params['email'];
    $exception = $params['exception'];
    // ...
})
```

**Deprecated****nos.deprecated****nos.deprecated(\$params)**

A deprecated message will be write in log.

**Parameters**

- **\$params** (array) –  
    **\$message** The message to log.  
    **\$since** The version since deprecation.  
    **\$debug\_backtrace** The debug\_backtrace

```
<?php

Event::register('nos.deprecated', function($params)
{
    $message = $params['message'];
    $since = $params['since'];
    $debug_backtrace = $params['debug_backtrace'];
    // ...
});
```

## Migration

### migrate.exception

#### **migrate.exception(\$params)**

A migration throw an exception. Exception propagation can be stopped.

##### Parameters

- **\$params** (array) –  
    **\$e** The exception object  
    **&\$ignore** boolean If the event change is value to true, the exception will not be propagated.  
    **\$migration** array The migration array

```
<?php

Event::register_function('migrate.exception', function($params)
{
    $e = $params['e'];
    $ignore = $params['ignore'];
    $migration =& $params['migration'];
    // ...

    $ignore = true; // The exception will not be propagated
});
```

## 1.1.12 FuelPHP

### Glossary

#### Orm\Model

Native FuelPHP ORM Model. The M of MVC.

See [http://fuelphp.com/docs/packages/orm/creating\\_models.html](http://fuelphp.com/docs/packages/orm/creating_models.html)

#### Controller

The C of MVC.

See <http://fuelphp.com/docs/general/controllers/base.html>

## Relations

FuelPHP ORM mechanism to link Model between them.

See <http://fuelphp.com/docs/packages/orm/relations/intro.html>

## Observers

FuelPHP ORM mechanism to add event on Model.

See <http://fuelphp.com/docs/packages/orm/observers/intro.html>

## Environments

FuelPHP manages environments natively.

See <http://fuelphp.com/docs/general/environments.html>

## HMVC

A FuelPHP concept.

See <http://fuelphp.com/docs/general/hmvc.html>

## has\_many

A native *FuelPHP ORM relation*.

See [http://fuelphp.com/docs/packages/orm/relations/has\\_many.html](http://fuelphp.com/docs/packages/orm/relations/has_many.html)

## belongs\_to

A native *FuelPHP ORM relation*.

See [http://fuelphp.com/docs/packages/orm/relations/belongs\\_to.html](http://fuelphp.com/docs/packages/orm/relations/belongs_to.html)

## many\_many

A native *FuelPHP ORM relation*.

See [http://fuelphp.com/docs/packages/orm/relations/many\\_many.html](http://fuelphp.com/docs/packages/orm/relations/many_many.html)

## Model->find()

Native method of FuelPHP ORM Model.

See <http://fuelphp.com/docs/packages/orm/crud.html#read>

## Extended Classes

We extended some classes from FuelPHP. The additions we made are listed in this page.

- *Core Classes*
  - *Arr*
  - *Autoloader*
  - *Cache\_Storage\_File*
  - *Config*
  - *Date*
  - *Email\_Driver*
  - *Event\_Instance*
  - *Fieldset and Fieldset\_Field*
  - *File*
  - *Finder*
  - *Image*
  - *Log*
  - *Module*
  - *Response*
  - *Security*
  - *Session*
  - *Str*
  - *View*
- *ORM Package*
  - *Model*
  - *Query*

## Core Classes

**Arr** Added the static **recursive\_filter(\$array, \$callback)** method.

## Autoloader

- Filename suffixes are available for *model*, *controller*, and *view*, as follow: **model.model.php**, **controller.ctrl.php**, **view.view.php**. For instance, if you have a *Controller\_Admin\_Page* controller, its filename can either be *classes/controller/admin/page.php* or *classes/controller/admin/page.ctrl.php*.
- It is possible to add new class aliases and access existing aliases using the **addClassAlias** and **getClassAliases** functions.
- The **generateSuffixedNamespace** function allow to generate a customized namespace for files such as tasks or migrations

**Cache\_Storage\_File** **\_\_construct()** will try to create the specified cache directory when it doesn't exists.

**Config** Added events to alter the loaded configuration.

## Date

- Added the static method **compare(\$date1, \$date2)**
- Added the instance method **modify(\$modify)**

**Email\_Driver** **send()**: we added *two events* *email.before\_send* and *email.after\_send*

**Event\_Instance** Added two methods `register_function()` and `trigger_function()` to deal with by-reference arguments.

### Fieldset and Fieldset\_Field

- Added the static method `Fieldset::build_from_config()`
- Added the public method `$fieldset->getInstance()`: it gets the current model instance processed by the fieldset
- Integration of `renderers` in the methods of these two classes

**File** Added the method `relativeSymlink()`

### Finder

- Added the Novius OS framework path in the searched paths
- Allow for filename suffixes for `config`, `views` and `lang` files (same rule as the `Autoloader`, see above)

**Image** Added the static method `shrink($max_width, $max_height = null, $keepar = true, $pad = false)`

### Log

- Added the static method `Log::deprecated($message, $since)`
- Added the static method `Log::exception($e, $prefix)`

**Module** Allow for a custom namespace retrieved from the config when loading a module (used in our applications).

**Response** Added the static method `json()` to return JSON data

**Security** Added the method `htmlspecialchars()`

**Session** Added the static method `user()` to retrieve the current logged in user in the back-office.

**Str** Added the static methods `textToHtml($text)`

**View** Added the static method `redirect($from, $to, $callback)`

## ORM Package

### Model

- Added a cache for `Model::$_properties`
- Added `behaviours`
- Added some `relations`
- Added two options in build options:
  - `before_where`

An array, search\_column => \$replace, where \$replace can be a string or a closure which takes the \$condition array by parameter  
If \$replace return null, the \$condition will be remove from the where options

#### before\_order\_by

An array, search\_column => \$replace, where \$replace can be a string or a closure which takes the entry column by parameter  
If \$replace return null, the column will be remove from the order\_by options

**Query** Added getters for alias, connection and model.

## 1.2 Javascript API

### 1.2.1 \$ functions

#### \$

In this documentation, \$ means the jQuery object itself.

```
$.nosNotify('message');
```

### Functions

#### nosDataReplace

`$.nosDataReplace (object, data)`

Replaces placeholder defined by the {{placeholder}} pattern in a string or JSON.

##### Arguments

- **object** (*mixed*) – A string or a JSON, where to search placeholder to replace.
- **data** (*JSON*) – A JSON, placeholder => replacement value.

**Returns** Initial object with placeholders replaced.

```
$.nosDataReplace(obj, data);

$.nosDataReplace('exemple {{foo}}', {foo : 'bar'});
// returns 'exemple bar'

$.nosDataReplace({
    astring: 'example {{foo}}',
    json: {
        string: 'sample {{bar}}',
    }
},
{
    foo : 'bar',
    bar : 'foo'
});
//returns {
```

```
//      astring: 'example bar',
//      json: {
//          string: 'sample foo',
//      }
```

## nosNotify

`$.nosNotify(message[, type])`

Displays notification(s) to the user. This is a wrapper of the jQuery plugin Pines Notify.

### Arguments

- **message** (*mixed*) – string The message to display or a JSON for special configuration.
- **type** (*string*) – Type of the message. Can be notice (default), info, success or error.

```
$.nosNotify('message');

$.nosNotify('message', 'error');

$.nosNotify({
    title: 'It\'s working',
    type: 'success',
    sticker: false, // Don't provide a button for the user to manually stick the notice.
    hide: false, // Don't remove the notification after a delay.
});
```

## nosUIElement

`$.nosUIElement(element[, data])`

### Arguments

- **element** (*JSON*) – JSON definition of the element to create.

**type** string. button (default) or link. See  
`$container.nosFormUI()` for buttons data, those of links  
are almost the same.

**label** string. Element label.

**action** {}. Action bound to the click event. See  
`$container.nosAction()`.

**bind** {}. Event(s) bound to the element. See `$(0).bind()`.

**disabled** boolean or string. If true or string, the element is disabled. If it is a string, it will fill the element's title.

**menu** {}. If set, binds a context menu to element.

**menus** [{}]. Array containing each menu line.

**action** {}. Action bound to the click event of the menu line.  
See `$container.nosAction()`.

**content** string. HTML content of the menu line.

**label** string. Label of the menu line.

**icon** Icon name (See icons name of jQuery UI) without the ui-icon- prefix.

**iconClasses** CSS classes of icon.

**iconUrl** Icon URL.

**options** { }. Settings for Wijmo widget wijmenu.

- **data (JSON)** – Data attached to element and passed to action. See `$container.nosAction()`.

**Returns** A DOM element detach from DOM.

```
$ .nosUIElement({
    type: 'button',
    label: 'A button'
},
{
    id: 5
    foo: 'bar'
});
```

**Note:** content and label are exclusive. You don't need both. Same goes for the icon (either use a name, CSS classes or an URL).

## 1.2.2 \$container functions

### \$container

In this documentation, \$container means a jQuery collection of DOM elements.

```
$('#id').nosTabs('open', {
    url: 'url',
    iframe: false,
    label: 'Title',
    labelDisplay: true,
    iconUrl: 'icon.png',
    iconSize: 16
});
```

**Function with sub-functions** Many functions of the Novius OS Javascript API have sub-functions. The first parameter is the name of a sub-function. If this parameter is omitted, the default sub-function is called.

```
$('#id').nosTabs('open', {
    url: 'url',
    iframe: false,
    label: 'Title',
    labelDisplay: true,
    iconUrl: 'icon.png',
    iconSize: 16
});

// This call do the same thing that the previous
$('#id').nosTabs({
    url: 'url',
```

```

        iframe: false,
        label: 'Title',
        labelDisplay: true,
        iconUrl: 'icon.png',
        iconSize: 16
    });

```

## Functions

### **nosAction**

`$container.nosAction(action[, data])`

Executes an action

#### Arguments

- **action** (JSON) – JSON defines the action to execute. JSON must have an `action` key, can be :

**nosTabs** `nosAction.nosTabs`

**nosDialog** `nosAction.nosDialog`

**confirmationDialog** `nosAction.confirmationDialog`

**nosAjax** `nosAction.nosAjax`

**window.open** `nosAction.windowOpen`

**document.location** `nosAction.documentLocation`

**nosMediaVisualise** `nosAction.nosMediaVisualise`

**dialogPick** `nosAction.dialogPick`

- **data** (JSON) – JSON contextual data. Used to replace placeholder in `action` by calling `$.nosDataReplace()`.

#### Actions list

- `nosTabs`
- `nosDialog`
- `confirmationDialog`
- `nosAjax`
- `window.open`
- `document.location`
- `nosMediaVisualise`
- `dialogPick`

### **nosTabs**

`nosAction.nosTabs`

**Action** `nosTabs`

**Method** Any sub-function name of `$container.nosTabs()`.

**Tab** First parameter passed to sub-function of `$container.nosTabs()`.

**Dialog** Second parameter passed to sub-function of `$container.nosTabs()`.

```

$(domContext).nosAction({
    action: 'nosTabs',

```

```
        method: 'add',
        tab: {
            url: 'path/url',
            label: 'A title',
            iconUrl: 'url/of/icon.png'
        },
        dialog: {
            width: 800,
            height: 400
        }
    );
});
```

### **nosDialog**

`nosAction.nosDialog`

**Action** nosDialog

**Dialog** Second parameter passed to `nosDialog.open()`.

```
$(domContext).nosAction({
    action: 'nosDialog',
    dialog: {
        ajax: true,
        contentUrl: 'path/url/',
        title: 'A title',
        width: 500,
        height: 200
    }
});
```

### **confirmationDialog**

`nosAction.confirmationDialog`

A special form of `nosAction.nosDialog` for confirmation.

**Action** confirmationDialog

**Dialog** Second parameter passed to `nosDialog.open()`.

```
$(domContext).nosAction({
    action: 'confirmationDialog',
    dialog: {
        contentUrl: 'path/url/',
        title: 'A title'
    }
});
```

### **nosAjax**

`nosAction.nosAjax`

**Action** nosAjax

**Params** Settings of `$container.nosAjax()`.

```
$(domContext).nosAction({
    action: 'nosAjax',
    params: {
        url: 'path/url',
        method: 'POST',
        data: {
            id: '{{_id}}'
        }
});
```

```

        )
    }
}, {
    _id: 5
});

```

**window.open****nosAction.windowOpen**

Open a new browser window.

**Action** `window.open`

**Url** URL of the new window.

```

$(domContext).nosAction({
    action: 'window.open',
    url: 'path/url'
});

```

**document.location****nosAction.documentLocation**

Redirects the browser window to a new URL.

**Action** `document.location`

**Url** The new URL.

```

$(domContext).nosAction({
    action: 'document.location',
    url: 'path/url'
});

```

**nosMediaVisualise****nosAction.nosMediaVisualise**

This action has no parameters. It only depends on the data passed with action. See

`$.nosMediaVisualise()`.

**Action** `nosMediaVisualise`

```

$(domContext).nosAction({
    action: 'nosMediaVisualise'
}, {
    path: 'url/of/media/',
    image: true
});

```

**dialogPick****nosAction.dialogPick**

**Action** `dialogPick`

**Event** Name of the event to trigger.

```

$(domContext).nosAction({
    action: 'dialogPick',
    'event' => 'event_name'
});

```

## nosAjax

`$container.nosAjax(options)`

Performs an asynchronous HTTP (AJAX) request. This is a wrapper of `jQuery.ajax()`.

### Arguments

- **options (JSON)** – JSON that configure the AJAX request. Same that `jQuery.ajax()` with some differences:
  - Some defaults options.
  - Callback functions `success` and `error` are monkey-patched to execute defaults operations.
    - \* Function `$container.nosAjaxSuccess()` is automatically called if the request succeeds and return type is JSON.
    - \* Function `$container.nosAjaxError()` is automatically call if the request fails.

```
$ (domContext).nosAjax({  
    dataType: 'json', // datatype is default 'json'.  
    type: 'POST', // The request is made in POST by default.  
    data: {}  
});
```

## nosAjaxSuccess

`$container.nosAjaxSuccess(options)`

Process JSON of a succeeded AJAX request.

### Arguments

- **options (JSON)** –
  - notify** A string or {object}. Use for call `$.nosNotify()`. If only a string is given, notification type will be ‘notice’, otherwise call `$nosNotify` with the object parameters.
  - error** A string or {object}. Use for call `$.nosNotify()` with `error` for notification type.
  - action** A string or {object}. Use for call `$container.nosAction()`.
  - closeDialog** Boolean. If true, call `nosDialog.close()`.
  - closeTab** Boolean. If true, call `nosTabs.close()`.
  - replaceTab** {}. Use to call `nosTabs.update()`.
  - redirect** string. Redirect browser window to this URL.
  - dispatchEvent** Use to call `$container.dispatchEvent()`.
  - internal\_server\_error** Display error and backtrace in the browser console.

## nosAjaxError

`$container.nosAjaxError(jqXHR, textStatus)`

Process a failed AJAX request.

Display the reconnection popup if the error comes to an end of the authentication session.  
Display a notification otherwise.

#### Arguments

- **jqXHR** (*jqXHR*) – An XMLHttpRequest object.
- **textStatus** (*string*) – Text status of the AJAX request.

### **nosDialog**

`$container.nosDialog([method[, options[, ... ]]])`

Manages back-office's popup. This is a *function with sub-functions*.

#### Arguments

- **method** (*mixed*) – The sub-function name, open (default) or close. If omitted this is the first parameter of the default sub-function `nosDialog.open()`.
- **options** (*mixed*) – Parameters of the sub-function.

#### **nosDialog('open')**

`nosDialog.open(dialog)`

Opens a popup. This is a wrapper of Wijmo widget Dialog.

A popup can be created in three ways:

- From an existing DOM element.
- From an URL loaded into an iframe.
- Form an URL loaded into a <div> from an AJAX request.

Catch events dispatched by `$.nosDispatchEvent()`.

#### Arguments

- **options** (*JSON*) – JSON that configures the popup. Same as `$.wijdialog()` with some differences:

Some defaults options:

**width** Container width minus 200 pixels.

**height** Container height minus 100 pixels.

**modal** True

**captionButtons** Buttons pin, refresh, toggle, minimize and maximize are hidden.

Additional options:

**destroyOnClose** boolean. Destroys the popup when it's closed. Default true.

**ajax** boolean. If true, contentUrl is loaded using AJAX rather than using an iframe. Default true.

**ajaxData** {}. Data passed to the AJAX request (if ajax is true).

```
// Popup containing the HTML result of the AJAX request on contentUrl
$(domContext).nosDialog('open', {
    contentUrl: 'path/url',
    ajaxData: {
        foo: 'bar'
    },
    title: 'title of the popup',
```

```
height: 400,  
width: 700  
});  
  
// Same as previous, without first parameter, open is the default sub-function  
$(domContext).nosDialog({  
    contentUrl: 'path/url',  
    ajaxData: {  
        foo: 'bar'  
    },  
    title: 'title of the popup',  
    height: 400,  
    width: 700  
});  
  
// Popup containing an iframe width contentUrl href  
$(domContext).nosDialog({  
    iframe: true  
    contentUrl: 'path/url',  
    title: 'title of the popup',  
    height: 400,  
    width: 700  
});  
  
// Popup containing <div> with the id 'id_de_div'  
$('#id_de_div').nosDialog({  
    title: 'title of the popup',  
    height: 400,  
    width: 700  
});
```

### **nosDialog('close')**

**nosDialog.close()**

Closes the current popup dialog (i.e. from the current js:data::DOM container <\$container>).

```
$(domContext).nosDialog('close');
```

### **nosFormUI**

**\$container.nosFormUI()**

Will perform UI enhancements on DOM elements on all the children of js:data::\$container using [Wijmo](#) and [jQuery UI](#) widgets.

Element with a .notransform CSS class will be left unchanged.

**Input text** Using the wijtextbox widget.

**Select** Using the wijdropdown widget.

**Checkbox** Using the wijcheckbox widget.

**Radio** Using the wijradio widget.

**Expander**

Elements with the .expander CSS class using wijexpander widget.

You can set options with the data-wijexpander-options HTML attribute (JSON for additional settings).

**Accordion** Elements with CSS class .accordion using wijaccordion widget.

**Submit**

Using the `button` widget. | You can set options with the `data-` HTML attributes (additional settings).

**red** Makes the button red.

**icons { }**. Define icons for the button.

**icon** Defines the left icon using a name (See `icons` names of jQuery UI).

**iconClasses** Defines the left icon CSS classes for left icon.

**iconUrl** Define URL of the left icon.

```
$ (domContext).nosFormUI();
```

## nosFormAjax

`$container.nosFormAjax()`

Will use the `jquery-form` plugin to submit any form inside js:data::\$container using Ajax rather than the native browser action.

The default response data type is `json`, and the `success` and `error` callbacks functions will call `$container.nosAjaxSuccess()` and `$container.nosAjaxError()`.

```
$ (domContext).nosFormAjax();
```

## nosFormValidate

`$container.nosFormValidate()`

Will use the `jquery-validation` plugin to perform inline validation on any form inside js:data::\$container.

It's already configured to display error messages nicely, and take into account some specificity from the UI enhancements (like the accordion).

Most forms are using it, since it's part of the form's standard layout.

```
$ (domContext).nosFormValidate({});
```

## nosMedia

`$container.nosMedia([options])`

Transforms an `<input type="hidden">` element into a media selector UI in Media Center using plugin `inputFileThumb`.

### Arguments

- **options (JSON)** – Optional options

**mode** string. Can be `image` (default) or `all`.

**inputFileThumb { }**. options for `inputFileThumb` plugin.

```
$ (:input).nosMedia();
$ (:input).nosMedia({
    mode: 'image',
    inputFileThumb: {
        title: 'a title'
```

```
    }  
});
```

**See also:**

[Media Selector](#).

### **nosMediaVisualise**

`$ .nosMediaVisualise (media)`

Displays a media, in a popup for images or in a new browser window for other documents (like PDF).

**Arguments**

- **media** (*JSON*) – Media parameters
  - path** string. Media URL.
  - image** boolean.

```
$ .nosMediaVisualise({  
    path: 'url/of/media/',  
    image: true  
});
```

### **nosOnShow**

`$container .nosOnShow ([method[, options[, ... ]]])`

Special API which delays the rendering of UI elements when they become visible. A lot of UI elements don't initialise correctly when they are hidden (they can't calculate sizes properly).

This is a *function with sub-functions*.

**Arguments**

- **method** (*mixed*) – The sub-function name, `show` (default), `one` or `bind`. If omitted, this is the first parameter of the default sub-function `nosOnShow.show()`.
- **options** (*mixed*) – Parameters of the sub-function.

#### **nosOnShow('show')**

`nosOnShow.show()`

Triggers all functions bounded with `nosOnShow.bind()` for any children of `$container`.

**Warning:** You have to actually show the element before calling this function.

```
$ (domContext).show().nosOnShow();  
  
// Or  
$ (domContext).show().nosOnShow('show');
```

#### **nosOnShow('one')**

`nosOnShow.one (callback)`

Binds a callback function which will be called only the one time (at the first display).

**Arguments**

- **callback** (*function*) – A callback function.

```
$(element).nosOnShow('one', function() {
    $(this).widget();
});
```

**nosOnShow('bind')**`nosOnShow.bind(callback)`

Binds a callback function which will be called each time that the element becomes visible.

**Arguments**

- **callback (function)** – A callback function.

```
$(element).nosOnShow('bind', function() {
    $(this).widgetRefresh(); // widgetRefresh don't exist, it's an example.
});
```

**nosTabs**`$container.nosTabs([method[, options[, ...]]])`

Manages back-office's tabs. This is a *function with sub-functions*.

**Arguments**

- **method (mixed)** – The sub-function name, open (default), add, close, update or current. If omitted, this is the first parameter of the default sub-function `nosTabs.open()`.
- **options (mixed)** – Parameters of the sub-function.

**nosTabs('open')**`nosTabs.open(tab[, dialogOptions])`

Open a new tab or re-open an existing tab if it has the same URL.

**Arguments**

- **tab (mixed)** – JSON definition of tab.

**url** Required. Tab URL.

**iframe** If true, open tab in an iframe. Default false.

**label** Tab label.

**labelDisplay** If false, don't display the label, only the icon. Default true.

**iconUrl** Icon URL.

**iconSize** Icon size in pixel (square icon). Default 16.

- **dialogOptions (JSON)** – Within a popup, a tab will rather open another new popup instead (by calling `$container.nosDialog()`). This parameter set options for `$container.nosDialog()`.

```
$(domContext).nosTabs('open', {
    url: 'path/url',
    iframe: false,
    label: 'title',
    labelDisplay: true,
    iconUrl: 'path/icon.png',
    iconSize: 16
});
```

```
// Call simplified
$(domContext).nosTabs({
    url: 'path/url',
    iframe: false,
    label: 'title',
    labelDisplay: true,
    iconUrl: 'path/icon.png',
    iconSize: 16
});
```

### **nosTabs('add')**

`nosTabs.add(tab[, dialogOptions, position])`

Adds a new tab, even if an existing has the same URL.

#### **Arguments**

- **tab** (*mixed*) – JSON definition of tab.

**url** Required. Tab URL.

**iframe** If true, open tab in an iframe. Default `false`.

**label** Tab label.

**labelDisplay** If false, don't display the label, only the icon. Default `true`.

**iconUrl** Icon URL.

**iconSize** Icon size in pixel (square icon). Default 16.

- **position** (*string*) – Position of the new tab. Can be `end`, `before` or `after` the current tab of the `js:data:$container <$container>`.
- **dialogOptions** (*JSON*) – If DOM element in jQuery container is in popup, open a new popup by calling `$container.nosDialog()` instead of a tab. This parameter set options for `$container.nosDialog()`.

```
$(domContext).nosTabs(
    'add',
    {
        url: 'path/url',
        iframe: false,
        label: 'title',
        labelDisplay: true,
        iconUrl: 'path/icon.png',
        iconSize: 16
    },
    'end'
);
```

### **nosTabs('close')**

`nosTabs.close()`

Close current tab (compared to the tab where is the DOM element in jQuery container).

```
$(domContext).nosTabs('close');
```

### **nosTabs('update')**

`nosTabs.update(tab)`

Update current `js:data:$container` tab. Can load a new URL.

**Arguments**

- **tab** (*mixed*) – JSON definition of tab.
  - url** Required. Tab URL.
  - label** Tab label.
  - labelDisplay** If false, don't display the label, only the icon. Default true.
  - iconUrl** Icon URL.
  - iconSize** Icon size in pixel (square icon). Default 16.
  - reload** If true and `url` is set, load the new URL in the current tab. Default false.

```
$ (domContext).nosTabs('update', {
    url: 'path/url',
    label: 'Title',
    labelDisplay: true,
    iconUrl: 'path/icon.png',
    iconSize: 16
    reload: true
});
```

**nosTabs('reload')****nosTabs.reload()**

Reload current js:data::\$container tab.

```
$ (domContext).nosTabs('reload');
```

**nosTabs('current')****nosTabs.current(tab)**

Returns Index of the current js:data::\$container tab.

```
var current = $(domContext).nosTabs('current');
```

**nosToolbar****\$container.nosToolbar([method[, options[, ... ]]])**Manage back-office's toolbars. This is a *function with sub-functions*.**Arguments**

- **method** (*mixed*) – The sub-function name, add (default) or create. If omitted, this is the first parameter of the default sub-function `nosToolbar.add()`.
- **options** (*mixed*) – Parameters of the sub-function.

**nosToolbar('add')****nosToolbar.add(element[, right\_side])**

Adds an element to the toolbar of the current js:data::\$container. If no toolbar exists, creates a new one on-the-fly.

**Arguments**

- **element** (*mixed*) – Can be HTML code, a DOM element or a jQuery container.
- **right\_side** (*boolean*) – Default false, if true element added at the right side of the toolbar.

```
$ (domContext).nosToolbar('add', element, right_side);

\\ or
$ (domContext).nosToolbar(element, right_side);

\\ Add a button, right side of toolbar
$ (domContext).nosToolbar('<button>Exemple</button>', true);

\\ Add a link, left side of toolbar
var $a = $('<a href="#">Exemple</a>');
$ (domContext).nosToolbar($a);
```

#### **nosToolbar('create')**

`nosToolbar.create()`

Creates a toolbar in the current js:data::\$container.

```
$ (domContext).nosToolbar('create');
```

### 1.2.3 Events

The back-office of Novius OS is one “big HTML page”. Actions performed in one tab can affect other tabs (ex: adding, modifying or deleting an item).

An event system has been established to enable the various interface elements to communicate with each other.

On the one side, the interface elements are listening to events (by binding callbacks functions) by connecting to *dispatchers*.

On the other side, the different actions trigger events, usually returned by AJAX requests (see `$container.nosAjax()`), which are then dispatched to all interface elements via *dispatchers*.

Dispatched events are executed immediately on the current active tab or popup (the one which has focus). For other tabs (or popups), they are executed only when the tab or popup becomes active / focused.

#### **dispatcher**

A DOM element that receives system events. The child elements of the dispatcher can listen for events by connecting to it.

Each tab and popup have a dispatcher.

#### **Structure of an event**

##### **Event**

`Event.name`

string

Required

Event name. For events on a Model, the name is the Model name, including its PHP namespace.

**Event.id**

int or [int]

For events on a Model, ID(s) of the item to which they relate.

**Event.action**

string

Name of the action item that triggered the event. Ex: insert, update or delete.

**Event.context**

string or [string]

Context of the item that triggered the event. See [Multi-Contexts](#).**nosListenEvent**`$container.nosListenEvent(event, callback[, caller])`

Listen one (or many) event(s), i.e. register a callback function to be called when the event occurs.

Listening will be on current *dispatcher* (closest relatives in the DOM element in jQuery container).

For the callback function to be triggered, listened and triggered events should not match exactly. The listened event can just match one property of the triggered event.

**Arguments**

- **event** (*mixed*) – {} or [{}]. Required. JSON event to listen.
- **callback** (*function*) – Required. The callback function to execute when the event occurs. The function takes as parameter the triggered event.
- **caller** (*string*) – Caller name. If set, can stop listening to specific listener. See [\\$container.nosUnlistenEvent\(\)](#).

```
// Listen all events with name 'Nos\Model_Page'
$(domContext).nosListenEvent({
    name: 'Nos\Model_Page'
}, function(event) {
    // ...
}, 'caller');

// Listen all events with the 'Nos\Model_Page' name and 'insert' or 'delete' actions
$(domContext).nosListenEvent({
    name: 'Nos\Model_Page',
    action: ['insert', 'delete']
},
function(event) {
    // ...
});

// Listen all events with the 'Nos\Model_Page' name and 'insert' or 'delete' actions,
// or events with the 'Nos\Model_Page' name and the 'main::en_GB' context
$(domContext).nosListenEvent([
{
    name: 'Nos\Model_Page',
    action: ['insert', 'delete']
}
],
```

```
        {
            name; 'Nos\Model_Page',
            context; 'main::en_GB'
        }
    ], function(event) {
        // ...
});
```

## nosUnlistenEvent

`$container.nosUnlistenEvent(caller)`

Stop listening events for a specific caller. See [caller param of nosListenEvent](#).

### Arguments

- **caller** (string) – Caller name.

```
$(domContext).nosUnlistenEvent('caller');
```

## nosDispatchEvent

`$.nosDispatchEvent(event)`

Dispatches an event to all available [dispatchers](#).

### Arguments

- **event** (JSON) – See [Event](#).

```
// Dispatch event, page with ID 4 has been create with 'main::en_GB' context
$.nosDispatchEvent({
    name: 'Nos\Model_Page',
    action: 'insert',
    id: 4,
    context: 'main::en_GB',
});
```

## 1.3 Applications

### 1.3.1 Form Application

#### Events

##### noviusos\_form::rendering

`noviusos_form::rendering($params)`

Triggered by the enhancer before displaying the form to the user.

Allows to modify the `$fields` and the `$layout`. The `$item` (`Model_Form` instance) and `$enhancer_args` (`label_position`, etc.) variables are read-only.

#### Parameters

- **\$params** (array) –

**&\$fields** Fields list

**label** Callback used to generate the label

**callback** string Callback function name

**args** array Callback function args  
**field** Callback used to generate the field  
**callback** string Callback function name  
**args** array Callback function args  
**instructions** Callback used to generate the instructions  
**callback** string Callback function name  
**args** array Callback function args  
**new\_row** bool Should the field be on a new row?  
**new\_page** bool Should the field be on a new page?  
**width** int Column size (value between 1 and 4)  
**item** Model\_Field Field instance  
**&\$layout** string Path to the view used to render the form  
**\$item** Model\_Form Form instance

```
<?php

Event::register_function('noviusos_form::rendering', function(array &$args)
{
    $fields = & $args['fields'];
    $layout = & $args['layout'];
    $form = $args['item']; // Instance of Nos\Form\Model_Form
    $enhancer_args = $args['enhancer_args'];

    // This is an exemple of what $layout contains
    $layout = 'noviusos_form::foundation';

    foreach ($fields as &$field) {

        // This is an example of what $field contains
        $field = array(
            'label' => array(
                'callback' => array('Form', 'label'),
                'args' => array('Label:', 'technical_id', array(
                    'for' => 'field_technical_id',
                )),
            ),
            'field' => array(
                'callback' => array('Form', 'input'),
                'args' => array('field_name', 'field_value', array(
                    'id' => 'field_technical_id',
                    'class' => 'field_technical_css',
                    'title' => 'Label:',
                    'placeholder' => 'Label:',
                    'required' => 'required',
                )),
            ),
            'instructions' => array(
                'callback' => 'html_tag',
                'args' => array('p', array('class' => 'instructions'), 'Instructions for the use'
            )),
            'new_row' => true,
        );
    }
}
```

```
        'new_page' => true,
        'width' => 4,
        'item' => $item, // Instance of Nos\Form\Model_Field
    );
}

// ...
}
```

### noviusos\_form::rendering.<virtual\_name>

Same as noviusos\_form::rendering, but only triggered for a form with the specified <virtual\_name>.

### noviusos\_form::data\_validation

**Warning:** This function must return an array containing the detected validation errors.

#### noviusos\_form::data\_validation(&\$data, \$fields, \$form)

Additional data validation after submitting a form from the Form application.

##### Parameters

- **&\$data (array)** – Received data (roughly \$\_POST)
- **\$fields (object)** – Array of Model\_Field Field instance, field names in keys
- **\$form (object)** – Model\_Form Form instance

##### Return array

List of validation errors

```
<?php

Event::register_function('noviusos_form::data_validation', function(&$data, $fields, $form) {

    $errors = array();
    // This will mark all fields as error
    foreach ($data as $name => $value) {
        $errors[$name] = "{$label}: '{$value}' non valid.';
    }
    return $errors;
});
```

The messages can contain the {{label}} and {{value}} placeholders (they will be replaced appropriately).

### noviusos\_form::data\_validation.<virtual\_name>

Same as noviusos\_form::data\_validation, but only triggered for a form with the specified <virtual\_name>.

### noviusos\_form::before\_submission

#### noviusos\_form::before\_submission(&\$data, \$form, \$enhancer\_args)

Before saving the answer in the database

##### Parameters

- **&\$data (array)** – Received data (to save in DB)

- **\$form** (*object*) – Model\_Form Form instance
- **\$enhancer\_args** (*array*) – Enhancer configuration

**Return bool** false to prevent saving the answer in the database

```
<?php

Event::register_function('noviusos_form::before_submission', function(&$data, $form, $enhancer_args) {
    // You can alter $data before saving them into the database

    // Or you can return 'false' if you don't want the answer to be saved in the database
    return false;
});
```

### noviusos\_form::before\_submission.<virtual\_name>

Same as noviusos\_form::before\_submission, but only triggered for a form with the specified <virtual\_name>.

### noviusos\_form::after\_submission

#### noviusos\_form::after\_submission (\$params)

After the answer has been created (not saved in the DB yet)

##### Parameters

- **\$params** (*array*) –

**\$answer** Model\_Answer Answer instance

**\$enhancer\_args** Array, enhancer configuration

```
<?php

Event::register('noviusos_form::after_submission', function($params) {
    $answer = $params['answer'];
    $enhancer_args = $params['enhancer_args'];
    // ...
});
```

### noviusos\_form::after\_submission.<virtual\_name>

Same as noviusos\_form::after\_submission, but only triggered for a form with the specified <virtual\_name>.

## 1.3.2 Slideshow Application

To modify configuration of slideshow, extend configuration file noviusos\_slideshow::slideshow.

### Configuration

**default\_format** The default format. flexslider-big by default.

**formats**

### **flexslider-big**

**view** The view use to display the slideshow. Default noviusos\_slideshow::flexslider/slideshow.

**label** The label of the format, displayed in enhancer popup.

#### **config**

**slides\_with\_link** Boolean. Add a link on image if true and slide linked to a page. Default true.

**slides\_preview** Boolean. Add a toolbar preview on the slideshow. Default true.

**width** Width in pixels of the slideshow. Default 800.

**height** Height in pixels of the slideshow. Default 600.

**class** CSS class add on the slideshow HTML container. Default slide-home.

#### **js**

**jquery** Relative URL of jQuery script.

**flexslider** Relative URL of Flexslider script.

**flexpreview** Relative URL of Flexslider preview script.

#### **css**

**flexslider** Relative URL of Flexslider CSS file.

**flexpreview** Relative URL of Flexslider preview CSS file.

### **flexslider-small**

**view** The view use to display the slideshow. Default noviusos\_slideshow::flexslider/slideshow.

**label** The label of the format, displayed in enhancer popup.

#### **config**

**slides\_with\_link** Boolean. Add a link on image if true and slide linked to a page. Default true.

**slides\_preview** Boolean. Add a toolbar preview on the slideshow. Default true.

**width** Width in pixels of the slideshow. Default 414.

**height** Height in pixels of the slideshow. Default 300.

**class** CSS class add on the slideshow HTML container. Default slide-small.

**js**

**jquery** Relative URL of jQuery script.

**flexslider** Relative URL of Flexslider script.

**flexpreview** Relative URL of Flexslider preview script.

**css**

**flexslider** Relative URL of Flexslider CSS file.

**flexpreview** Relative URL of Flexslider preview CSS file.

You can add your own formats. Keys `view` and `label` are required in your format. If defined, the key `config` is passed to the displaying view.

## Flexslider

You can configure Flexslider formats by extend configuration file `noviusos_slideshow::formats/flexslider`.

**animation** Select your animation type, `fade` or `slide`. Default `fade`.

**slideDirection** Select the sliding direction, `horizontal` or `vertical`.

**slideshow** Boolean, animate slider automatically. Default `true`.

**slideshowSpeed** Integer, set the speed of the slideshow cycling, in milliseconds.

**animationDuration** Integer, set the speed of animations, in milliseconds.

**directionNav** Boolean, create navigation for previous/next navigation.

**controlNav** Boolean, create navigation for paging control of each slide. Note: Leave true for manual-Controls usage.

**keyboardNav** Boolean, allow slider navigating via keyboard left/right keys.

**mousewheel** Boolean, allow slider navigating via mousewheel.

**prevText** Set the text for the previous directionNav item.

**nextText** Set the text for the next directionNav item.

**pausePlay** Boolean, create pause/play dynamic element.

**pauseText** Set the text for the pause pausePlay item.

**playText** Set the text for the play pausePlay item.

**randomize** Boolean, randomize slide order.

**slideToStart** Integer, the slide that the slider should start on. Array notation (0 = first slide).

**animationLoop** Boolean, should the animation loop? If false, directionNav will receive “disable” classes at either end.

**pauseOnAction** Boolean, pause the slideshow when interacting with control elements, highly recommended.

**pauseOnHover** Boolean, pause the slideshow when hovering over slider, then resume when no longer hovering.

**controlsContainer** Selector, declare which container the navigation elements should be appended too. Default container is the flexSlider element. Example use would be ".flexslider-container", "#container", etc. If the given element is not found, the default action will be taken.

**manualControls** Selector, declare custom control navigation. Example would be ".flex-control-nav li" or "#tabs-nav li img", etc. The number of elements in your controlNav should match the number of slides/tabs.

### 1.3.3 Blog/News Application

To modify configuration of Blog or News, extend respectively configuration files noviusos\_blog::config or noviusos\_news::config.

#### Configuration

##### categories

**enabled** Boolean, true to enable categories. Default true for Blog and News.

**show** Boolean, true to show categories in front. Default true for Blog and News.

##### tags

**enabled** Boolean, true to enable tags. Default true for Blog and false for News.

**show** Boolean, true to show tags in front. Default true for Blog and News.

##### authors

**enabled** Boolean, true to enable authors. Default true for Blog and false for News.

**show** Boolean, true to show authors in front. Default true for Blog and News.

##### summary

**enabled** Boolean, true to enable summary. Default true for Blog and News.

**show** Boolean, true to show summary in front. Default true for Blog and News.

##### comments

**enabled** Boolean, true to enable comments. Default true for Blog and false for News.

**show** Boolean, true to show comments in front. Default true for Blog and News.

**show\_nb** Boolean, true to show the number of comments in front. Default true for Blog and News.

**can\_post** Boolean, true if user can post new comments. Default true for Blog and News.

##### publication\_date

**enabled** Boolean, true to enable publication dates. Default true for Blog and News.

**show** Boolean, true to show publication dates in front. Default true for Blog and News.

##### thumbnail

**front****list**

**link\_to\_item** Boolean, `true` if you want a link to item on the thumbnail. Default `true` for Blog and News.

**max\_width** Integer, width in pixels of the thumbnail. Default 120 for Blog and News.

**item**

**link\_to\_fullsize** Boolean, `true` if you want a link to fullsize image on the thumbnail. Default `true` for Blog and News.

**max\_width** Integer, width in pixels of the thumbnail. Default 200 for Blog and News.

### 1.3.4 Comments Application API

#### Behaviour Commentable

**class Nos\Comments\Orm\_Behaviour\_Commentable**

Adds the ability to use the Comment API on an a *Nos\Orm\Model*.

#### Methods

**static Nos\Comments\Orm\_Behaviour\_Commentable::commentApi**

**Returns** An instance of `Nos\Comments\Api`, configured for this item.

`Nos\Comments\Orm_Behaviour_Commentable::count_comments()`

Returns and caches the number of comments related to one item

**Returns** Number of comments

`Nos\Comments\Orm_Behaviour_Commentable::setNbComments ($nb)`

Allow to enter a custom cached number of comments related to the item. Can be useful when adding or removing a comment for instance.

**Parameters**

- `$nb` – number of comments

**static Nos\Comments\Orm\_Behaviour\_Commentable::count\_multiple\_comments (\$items)**

From a items' list, retrieve the number of comments in an optimal way.

**Parameters**

- `$items` –

#### Relations

This behaviour adds a **comments** relation to retrieve all the published comments of the Model.

#### Others

- This behaviours adds a **Comments** action on the Model's App Desk, which will open a tab listing all the comments of the item.

- This behaviours adds a **Comments** column in the App Desk, containing the number of comments for each item.

### Example

```
<?php

class Model_Monkey extends \Nos\Orm\Model
{
    protected static $_behaviours = array(
        'Nos\Comments\Orm_Behaviour_Commentable' => array(
            ),
    );
}
```

### API Class

```
class Nos\Comments\Api

Nos\Comments\Api::__construct ($config)
    Parameters
        • $config (array) – API configuration

Nos\Comments\Api::addComment ($data)
    Parameters
        • $data (array) –
            ismm Must be equal to anti_spam_identifier.passed of the
                    comments API configuration.
            id Id of the item on which the comment was post
            comm_email Email of the commenter
            comm_author Name of the commenter
            comm_content Content of the comment
            subscribe_to_comments True if the commenter accept to receive new
                    comments by email
            recaptcha_challenge_field The content of recaptcha challenge field
            recaptcha_response_field The content of recaptcha response field
    Returns True if comment is added, false if not passed recaptcha, ‘none’ if not passed anti
            spam.

Nos\Comments\Api::sendNewCommentToAuthor (Model_Comment $comment)
    Parameters
        • $comment (Model_Comment) – The new comment

Nos\Comments\Api::sendNewCommentToCommenters (Model_Comment $comment)
    Parameters
        • $comment (Model_Comment) – The new comment

Nos\Comments\Api::getConfig ()
    Returns the API configuration.

Nos\Comments\Api::getRssComment ($comment)
    Parameters
```

- **\$comment** – Comment item

**Returns** An array (to be used with `Nos\Tools_RSS`)

`Nos\Comments\Api::getRss ($options = array())`

**Parameters**

- **\$options (array)** – If no key `item`, returns all comments of the model for the current context.

**item** A `Nos\Orm\Model` instance. If set, returns all comments of the item.

**Returns** A `Nos\Tools_RSS` instance.

`Nos\Comments\Api::changeSubscriptionStatus ($from, $email, $subscribe)`

**Parameters**

- **\$from (string)** – A `Nos\Orm\Model` instance
- **\$email (string)** – Email of the commenter to change the subscription status
- **\$subscribe (boolean)** – New subscription status (true to receive notifications, false to disable)

## Configuration

To modify the comments API configuration, you need to extend the configuration file `noviusos_comments::api`.

**default**

**default\_state** published or pending (if you want moderation)

**use\_recaptcha** false

**anti\_spam\_identifier**

**failed** 548

**passed** 327

**rss**

**model**

**nb** 20

**item**

**nb** 20

**send\_email**

**to\_author** true

**to\_commenters** true

**gravatar**

**size** 64

**setups** Array. The setup id in key, array like `default` for the value.

You can modify the `default` configuration, or add a setup for a specific model or a specific context.

If you want to change configuration for all cases:

```
<?php
array(
    'default' => array(
        'use_recaptcha' => true,
    ),
);
```

If you want to change configuration only for a specific model:

```
<?php
array(
    'setups' => array(
        'My\Namespace\Model_Item' => array(
            'use_recaptcha' => true,
        ),
    ),
);
```

If you want to change configuration only for a specific context:

```
<?php
array(
    'setups' => array(
        'main::en_GB' => array(
            'use_recaptcha' => true,
        ),
    ),
);
```

---

**Note:** If you want to activate Recaptcha, you have to install [this package](#) in local/packages.

---

## Model Comment

**class** Nos\Comments\Model\_Comment  
Extends [Nos\Orm\Model](#).

### Methods

Nos\Comments\Model\_Comment::getRelatedItem()

Retrieves the instance of the related item model, if it exists.

**Returns** Returns the Model instance, if it exists

Nos\Comments\Model\_Comment::changeSubscriptionStatus (\$from, \$email, \$subscribe)

Changes the user subscription status to new comments on an item.

#### Parameters

- **\$from** ([Nos\Orm\Model](#)) – Related item
- **\$email** (*string*) – The user's email address
- **\$subscribe** (*boolean*) – false to disable the subscription, true to enabled it

### 1.3.5 Application Wizard API

#### Application\_Generator Class

```
class Nos\AppWizard\Application_Generator
static Nos\AppWizard\Application_Generator::generate ($config, $input)
Parameters
  • $config (array) –
    generation_path Location of all files needed for the application generation
    folders Folders to create when generating an application
    files callback function
      param string $root_dir Root directory where all files must be generated (likely to be the generated application path)
      param array $data Form input
      param array $config Generator configuration
      returns Array of array, each array defining a file to be generated:
        template Generate from this view
        data View data
        destination
    category_types
      Key => value array defining categories (fields group type). Key is the category identifier.
      Value is an array containing:
        label
      fields Key => value array defining field types. Key is the field type identifier. Value is an array containing:
        label
        on_model_properties Will the field create an associated model property.
        • $input (array) – Form input
static Nos\AppWizard\Application_Generator::indent ($pre, $str)
  View helper that allows to keep a consistent indentation when generating code.
  Parameters
    • $pre (string) – Piece of string to be appended before each line (likely to be spaces)
    • $str (string) – Code to be indented
static Nos\AppWizard\Application_Generator::generateFolders ($root_dir, $folders)
  Generates folders from a list of folder paths
  Parameters
    • $root_dir (string) – Root directory where all folders are generated
    • $folders (array) – List of folder paths
```

**static** Nos\AppWizard\Application\_Generator::**generateFiles** (\$root\_dir, \$config, \$input)  
Generates applications files (models, controllers, view), from information on the configuration file and the form values.

**Parameters**

- **\$root\_dir** (*string*) – Root director (likely to be the generated application directory)
- **\$config** (*array*) – Configuration
- **\$input** (*array*) – Form values

## Configuration

The configuration is organized in a key => value structure to allow eventually multiple configuration management; for instance, one key's purpose could be to generate a basic application, an other key's purpose could be to generate a template.
