## Python Module Index

## Index
OctaDist: A tool for computing the distortion parameters in coordination complexes.

OctaDist (Octahedral Distortion calculator) is an inorganic chemistry and crystallography program for computing the distortion parameters, such as distance and angle distortions, in coordination complexes. For example, they are used for tracking structural change of the spin-crossover complex when the electronics spin-state changes from low-spin to high-spin, and vice versa. OctaDist can also be used to study other kind of the metal complex such as perovskite and metal-organic framework (MOF).

- Official homepage: https://octadist.github.io
- Github repository: https://github.com/OctaDist/OctaDist
OctaDist is maintained on Github version control system. All versions has been continuously tested using Travis CI. Currently, OctaDist project has two branches: Master (stable) and nightly-build (dev).

**Note:** OctaDist is open-source computer software and freely distributed under The GNU General Public License v3.0.

**Tip:** This documentation is generated be both user and reference code manuals. For more details, please go to the development page.
Please cite this project when you use OctaDist for scientific publication.
Bug report

For reporting a bug in OctaDist, please submit issues on OctaDist Github issues page. We appreciate all help and contribution in getting program development.
4.1 Getting Started

Welcome to the first section of the OctaDist documentation. Here you can find all information of OctaDist.

4.1.1 Why OctaDist?

Octahedral complex can be simply classified into two types: regular and distorted octahedron. The complexes with regular octahedral geometry (perfect octahedron) are expected to form, when all of the ligands are of the same kind. In contrast, if the ligands are of different kinds, the complex would turns the distorted octahedron instead. Octahedral distortion parameters has been widely used for determining the change of the distortion of the complexes.

Even though the people in community generally calculate the octahedral distortion parameters for their complexes, but they not used a certain way to do this. Moreover, there is no software for determining this kind of parameter yet. Therefore, we present the OctaDist program as a choice for those who are interested in this.

4.1.2 Features

**Structural distortion analysis**

- Determination of regular, irregular distorted, very distorted, and non-octahedral octahedral complexes
- **Calculation of octahedral distortion parameters**
  - Mean distance: \( d_{\text{mean}} \)
  - Distance distortion: \( \zeta \)
  - Angle distortion: \( \Sigma \)
  - Torsional distortion: \( \Theta \)
• Tilting distortion parameter: $\Delta$

**Molecular visualizations**

• 3D modelling of complex
• Display of eight faces of octahedron
• Atomic orthogonal projection and projection plane
• Twisting triangular faces
• Molecular superposition (Overlay)

**Tools and Utilities**

• Structural parameters
• Surface area
• Scripting Run supported
• Relationship plot between parameters
• Least-squares plane of selected ligand atoms
• Jahn-Teller distortion parameters
• Root-mean-square deviation of atomic positions (RMSD)

**Capabilities**

• Cross-platform for both 32-bit and 64-bit systems
• Graphical user interface (GUI)
• Command line interface (CLI)
• User-friendly interactive scripting code
• User-adjustable program setting
• Simple and flexible processes of use
• On top of huge and complicated complexes
• Support for several output of computational chemistry software, including Gaussian, Q-Chem, ORCA, and NWChem

**Architectures**

• Python-based program binding to Tkinter GUI toolkit and tested on PyCharm (Community Edition)
• Encapsulation of data, variable, and function as Class/Object.
4.1.3 Distortion parameters

Mathematical expression of the octahedral distortion parameters are given by following equations:

- \( \zeta \) parameter\[1\]

\[
\zeta = \sum_{i=1}^{6} |d_i - d_{mean}|
\]

where \( d_i \) is individual M-X bond distance and \( d_{mean} \) is mean metal-ligand bond distance.

- \( \Delta \) parameter\[2\]

\[
\Delta = \frac{1}{6} \sum_{i=1}^{6} \left( \frac{d_i - d_{mean}}{d_{mean}} \right)^2
\]

where \( d_i \) is individual M-X bond distance and \( d_{mean} \) is mean metal-ligand bond distance.

- \( \Sigma \) parameter\[3\]

\[
\Sigma = \sum_{i=1}^{12} |90 - \phi_i|
\]

where \( \phi_i \) is individual cis angle.

- \( \Theta \) parameter\[4\]

\[
\Theta = \sum_{i=1}^{24} |60 - \theta_i|
\]

where \( \theta_i \) is individual angle between two vectors of two twisting face.

4.1.4 System requirements

Minimum system requirements for OctaDist:

- Windows 7/8/10
- Linux (X11 Start)
- OS X 10.8+ and macOS 10.12+

4.2 Download OctaDist

4.2.1 Stable Version

The latest stable release of OctaDist is available for following OS and platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Version</th>
<th>Download</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows OS</td>
<td>Full (exe) / Full (zip)</td>
<td>Lite (exe) / Lite (zip)</td>
</tr>
<tr>
<td>Linux OS</td>
<td>Full (tar.gz)</td>
<td>Lite (tar.gz)</td>
</tr>
<tr>
<td>macOS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PyPI</td>
<td>pip install octadist</td>
<td></td>
</tr>
<tr>
<td>Anaconda</td>
<td>conda install -c rangsiman octadist</td>
<td></td>
</tr>
</tbody>
</table>
Note: Both full and lite versions of OctaDist are open-source and free to download under the GNU v.3 license. The full version contains all capabilities including standard calculations, structural analysis, and molecular visualization, whereas the lite version includes only standard calculations.

4.2.2 Development Version

An on-going development build of OctaDist, called nightly-build branch. The tarball can be downloaded at Dev-build (zip) or use the following command:

```
wget https://github.com/OctaDist/OctaDist/archive/nightly-build.zip
```

You can also use pip to install the latest development build version on your system using the following command:

```
pip install git+https://github.com/octadist/octadist.git@nightly-build
```

Note: Python version must be equal or higher than 3.5. See Development for more details.

4.2.3 Release Archives

The source code and executable of all version and release note can be found at

<table>

Total download:

4.3 Install OctaDist

OctaDist is a cross-platform software which is available for Windows, Linux, and macOS; for both 32-bit and 64-bit systems. You can install OctaDist by several ways, depending on your system and purpose.
4.3.1 Windows

Most of the Windows end-users do not have Python installed on their OS, so we strongly suggest you download and use a ready-to-use OctaDist executable.

Running OctaDist can be completed in a few steps as follows:

1. Download program executable (*.exe) to your machine:
   OctaDist-*-Win-x86-64.exe

2. Right click on program icon and select:
   Run as administrator

3. Click:
   Yes

Note: Windows Defender might recognize OctaDist as third-party software. For first time starting OctaDist in Windows, you should run it as an administrator with full rights.

4.3.2 Linux

OctaDist is available on Python package index library, which can be found at https://pypi.org/project/octadist. The end-user can use pip, a Python package-management system, to find and install OctaDist and other dependencies simultaneously.

Installing OctaDist can be completed in a few steps as follows:

1. Use pip command to install OctaDist:
   pip install octadist

2. Execute OctaDist GUI, just type:
   octadist

   or:
   octadist_gui

3. If you want to run OctaDist with command-line, just type:
   octadist_cli

4.3.3 macOS

Like Linux, installing OctaDist on macOS can be completed in a few steps as follows:

1. Press Command - spacebar to launch Spotlight and type Terminal, then double-click the search result.

2. Use pip command to install OctaDist:
3. Execute OctaDist GUI, just type:

```
octadist
```

or:

```
octadist_gui
```

4. If you want to execute OctaDist with command-line, just type:

```
octadist_cli
```

### 4.3.4 PyPI

The following commands are also useful for those who want to play with pip:

- Show info of package:

  ```
pip show octadist
  ```

- Install requirements packages:

  ```
pip install -r requirements.txt
  ```

- Install or upgrade to the latest version:

  ```
pip install --upgrade octadist
  ```

- Install/upgrade/downgrade to a certain version, for example, version 2.6.1:

  ```
pip install --upgrade octadist==2.6.1
  ```

- Install the package with a specific version of Python. for example:

  ```
python3.7 -m pip install --upgrade --user octadist
  ```

- Uninstall package:

  ```
pip uninstall octadist
  ```

More details on installing Python package can be found its official website: [https://packaging.python.org/tutorials/installing-packages](https://packaging.python.org/tutorials/installing-packages).

### 4.3.5 Anaconda

OctaDist is also available on Anaconda cloud server. The channel of OctaDist is at [https://anaconda.org/rangsiman/octadist](https://anaconda.org/rangsiman/octadist).

- It can be installed on system using command:

  ```
conda install -c rangsiman octadist
  ```

- To update OctaDist to the latest version:
conda update -c rangsiman octadist

- You can also create a personal environment only for OctaDist. For example, the following commands will create new env called newenv, then activate to this new env, and then install OctaDist from conda server:

```bash
conda create -n newenv python=3.7
activate newenv
conda update --all
conda install -c rangsiman octadist
```

- To clean conda cache:

```bash
conda clean --all
```

Note: OctaDist package on Anaconda server has been imported from PyPI server.

### 4.3.6 Python Package

OctaDist is a Python package and can be directly implemented into other applications. For example, that OctaDist is a package may be useful for interactive python script.

1. Check if your system has all dependencies for OctaDist:

```bash
python CheckPyModule.py
```

2. Download the source code (*.tar.gz) to your machine, for example, at Download directory:

```bash
OctaDist-*-src-x86-64.tar.gz
```

3. Uncompress the tarball, using tar:

```bash
tar -xzvf OctaDist-*-src-x86-64.tar.gz
```

4. Move to OctaDist root directory, using cd:

```bash
cd OctaDist-*-src-x86-64
```

5. Execute program like a package (you have to stay outside octadist directory):

```bash
python -m octadist
```

or command-line:

```bash
python -m octadist_cli
```

Note: The PyPI channel of OctaDist is at https://pypi.org/project/octadist/.

Tip: PIP-compressed zip files of OctaDist are also available at https://pypi.org/project/octadist/#files.
4.4 Build OctaDist

This section will explain how to build OctaDist from source code. If you already have OctaDist installed on your system, this section may be skipped.

4.4.1 Prerequisites

This section will explain the dependency requirements for building OctaDist. As OctaDist is written in Python 3, you have to make sure that the version of Python on your system is equal or higher than 3.5. Check it by following command:

```
python --version
```

or

```
python3 --version
```

Tip: If you do have Python on the system, I would suggest you to read The Hitchhiker’s Guide to Python. It is very useful!

Install Python 3 on:

- Windows
- Linux
- macOS

The following third-party packages are used in OctaDist.

```
numpy
scipy
matplotlib
rmsd
```

Actually, if you use pip to install OctaDist, the required dependencies will be installed automatically. However, you can install these packages yourself. This can be done with only one step:

```
pip install -r requirements.txt
```

4.4.2 Build the tarball, wheel, and egg

- `.tar.gz`: the tarball (supported by PIP)
- `.whl`: wheel file (supported by PIP)
- `.egg`: cross-platform zip file (supported by easy_install)

1. Build source code:

```
python setup.py sdist bdist_wheel bdist_egg
```

2. Install OctaDist:
OctaDist Documentation, Release 2.6.1

```
python setup.py install
```

or:
```
pip install dist/*.tar.gz
```

3. Run test zip files:
```
python setup.py test
```

4. Installed library of OctaDist will be install at `build/lib/octadist` directory.

5. Standalone executable (binary) file will be automatically added to environment variables, you can start OctaDist by calling its names anywhere:
   - To start graphical-interface:
     ```
     octadist
     ```
   - To start command-line:
     ```
     octadist_cli
     ```

**Note:** More details on Python package can be found its official website: [https://packaging.python.org/tutorials/installing-packages/](https://packaging.python.org/tutorials/installing-packages/)

### 4.4.3 Compile OctaDist to EXE

Program source code can be compiled as a standalone executable file (*.exe). Compilation can be completed easily using PyInstaller.

1. Upgrade pip:
```
pip install pip --upgrade
```

2. Install the latest version of PyInstaller:
```
pip install pyinstaller --upgrade
```

3. Check the version of PyInstaller:
```
pyinstaller --version
```

4. Change directory to `octadist` subdirectory, where `main.py` is, for example:
```
cd OctaDist-*-src-x86-64/octadist/
```

5. Compile a standalone, like this:
```
pyinstaller --onefile --windowed -n OctaDist-*-src-x86-64 main.py
```

6. The standalone executable will be build in `dist` directory.

**Note:** Other useful options for building executable can be found at [PyInstaller manual](https://pyinstaller.readthedocs.io/).
4.5 Run OctaDist

OctaDist supports both a graphical user interface (GUI) and a command line interface (CLI).

4.5.1 Run OctaDist GUI using EXE

If you have a standalone executable (.exe) of OctaDist GUI on your system, run OctaDist by double-clicking the .exe file as if you open other program.

Note: OctaDist can take time to launch the application, usually 5 - 10 seconds. However, if the program does not start, please restart your system and run it again.

4.5.2 Run OctaDist GUI on the terminal

Moreover, OctaDist can be called on the terminal such as CMD, PowerShell, and Terminal as long as it is added to environment variable, like this:

```
octadist
```

4.5.3 Run OctaDist CLI

You can execute command-line OctaDist interface by typing `octadist_cli` on the terminal. If it is executed without argument, the help docs will show by default.

```
(py37) user@Linux:~$ octadist_cli
# output
               [--par PARAMETER [PARAMETER ...]] [--show MOL [MOL ...]]

Octahedral Distortion Calculator:
A tool for computing octahedral distortion parameters in coordination complex.
For more details, please visit https://github.com/OctaDist/OctaDist.

optional arguments:
-h, -help          show this help message and exit
-v, --version      show program's version number and exit
-a, --about        show program info
-c, --cite         show how to cite OctaDist
-g, --gui          launch OctaDist GUI (this option is the same as 'octadist' command
-i INPUT, --inp INPUT  input structure in .xyz format
-o, --out          show formatted output summary
-s OUTPUT, --save OUTPUT  save formatted output to text file, please specify name of OUTPUT file without '.txt' extension
--par PARAMETER [PARAMETER ...]  select which the parameter (zeta, delta, sigma, theta) to show
--show MOL [MOL ...]  show atomic symbol (atom) and atomic coordinate
```

(continues on next page)
Using OctaDist to calculate the distortion of structure can be done as follows:

```bash
# Compute parameters
octadist_cli -i INPUT.xyz

# Compute parameters and show formatted output
octadist_cli -i INPUT.xyz -o

# Compute parameters and save output as file
octadist_cli -i INPUT.xyz -s OUTPUT
```

**Tip:** On Windows, you can check whether OctaDist is added to environment variables by using `where` command:

`where octadist`

For Linux and macOS, use `which` command instead:

`which octadist`

or

```bash
type -P "octadist" && echo "It's in path" || echo "It's not in path"
```

### 4.6 Example Calculations

#### 4.6.1 Supported File Format

- **XYZ file format**

```plaintext
<number of atoms>
comment line
<element 1>  <X>  <Y>  <Z>
<element 2>  <X>  <Y>  <Z>
<element 3>  <X>  <Y>  <Z>
...
```

- **Output of computational chemistry programs**

  File extension: `.out` and `.log`

  1. Gaussian
  2. NWChem
  3. ORCA
  4. Q-Chem
4.6.2 Running the tests

Example 1

Example 1 for running the test on OctaDist PyPI

```python
import octadist as oc

# The first atom must be metal center atom of octahedral structure.
# If not, please see example_2.py for how to handle this issue.
atom = ['Fe', 'O', 'O', 'N', 'N', 'N', 'N']

coord = [
    [2.298354000, 5.161785000, 7.971898000],  # <- Metal atom
    [1.885657000, 4.804777000, 6.183726000],
    [1.747515000, 6.960963000, 7.932784000],
    [4.094380000, 5.807257000, 7.588690000],
    [0.539005000, 4.482809000, 8.460040000],
    [2.812425000, 3.266553000, 8.131637000],
    [2.886404000, 5.392925000, 9.848966000]]

dist = oc.CalcDistortion(coord)
zeta = dist.zeta  # Zeta
delta = dist.delta  # Delta
sigma = dist.sigma  # Sigma
theta = dist.theta  # Theta

print("\nAll computed parameters")
print("-----------------------")
print("Zeta =", zeta)
print("Delta =", delta)
print("Sigma =", sigma)
print("Theta =", theta)

# All computed parameters
# -----------------------
# Zeta = 0.22807256171728651
# Delta = 0.0004762517834704151
# Sigma = 47.926528379270124
# Theta = 122.688972774546
```

Example 2

Example 2 for running the test on OctaDist PyPI

```python
import octadist as oc

atom = ['O', 'O', 'Fe', 'N', 'N', 'N', 'N']

coord = [
    [1.885657000, 4.804777000, 6.183726000],  # <- Metal atom
    [1.747515000, 6.960963000, 7.932784000],
    [4.094380000, 5.807257000, 7.588690000],
    [0.539005000, 4.482809000, 8.460040000],
    [2.812425000, 3.266553000, 8.131637000],
    [2.886404000, 5.392925000, 9.848966000]]
```

(continues on next page)
# If the first atom is not metal atom, you can rearrange the sequence
# of atom in list using coord.extract_octa method.

atom_octa, coord_octa = oc.molecule.extract_octa(atom, coord)

dist = oc.CalcDistortion(coord_octa)
zeta = dist.zeta       # Zeta
delta = dist.delta     # Delta
sigma = dist.sigma     # Sigma
theta = dist.theta     # Theta

print("\nAll computed parameters")
print("-----------------------")
print("Zeta =", zeta)
print("Delta =", delta)
print("Sigma =", sigma)
print("Theta =", theta)

# All computed parameters
# -----------------------
# Zeta = 0.22807256171728651
# Delta = 0.0004762517834704151
# Sigma = 47.926528379270124
# Theta = 122.688972774546

Example 3

Example 3 for running the test on OctaDist PyPI

```python
import octadist as oc

# You can also import your input file, like this:

file = r"../example-input/Multiple-metals.xyz"

# Then use coord.extract_file to extract all atomic symbols and coordinates,
# and then use coord.extract_octa for taking the octahedral structure.

atom_full, coord_full = oc.molecule.extract_coord(file)
atom, coord = oc.molecule.extract_octa(atom_full, coord_full)

dist = oc.CalcDistortion(coord)
zeta = dist.zeta       # Zeta
delta = dist.delta     # Delta
sigma = dist.sigma     # Sigma
theta = dist.theta     # Theta

print("\nAll computed parameters")
print("-----------------------")
print("Zeta =", zeta)
print("Delta =", delta)
print("Sigma =", sigma)
print("Theta =", theta)
```

(continues on next page)
Example 4

Example 4 for running the test on OctaDist PyPI

```python
import octadist as oc

file = r"../example-input/Multiple-metals.xyz"

atom_full, coord_full = oc.molecule.extract_coord(file)

# If complex contains metal center more than one, you can specify the index metal
# whose octahedral structure will be computed.
# For example, this complex contains three metal atoms: Fe, Ru, and Rd.
# I add "2" as a second argument for choosing Ru as metal of interest.

atom, coord = oc.molecule.extract_octa(atom_full, coord_full, 2)

dist = oc.CalcDistortion(coord)
zeta = dist.zeta  # Zeta
delta = dist.delta  # Delta
sigma = dist.sigma  # Sigma
theta = dist.theta  # Theta

print("\nAll computed parameters")
print("-----------------------")
print("Zeta =", zeta)
print("Delta =", delta)
print("Sigma =", sigma)
print("Theta =", theta)
```

Example 5

Example 5 for running the test on OctaDist PyPI

```python
import octadist as oc

file = r"../example-input/Multiple-metals.xyz"

atom_full, coord_full = oc.molecule.extract_coord(file)
```
# Graphical display for octahedral complex

my_plot = oc.draw.DrawComplex(atom=atom_full, coord=coord_full)
my_plot.add_atom()
my_plot.add_bond()
my_plot.add_legend()
my_plot.show_plot()

Example 6

Example 6 for running the test on OctaDist PyPI

```python
import octadist as oc

file = r"../example-input/Multiple-metals.xyz"

atom_full, coord_full = oc.molecule.extract_coord(file)

# Display and automatically save image as .png file with user-specified name

my_plot = oc.draw.DrawComplex(atom=atom_full, coord=coord_full)
my_plot.add_atom()
my_plot.add_bond()
my_plot.add_legend()
my_plot.save_img()
my_plot.show_plot()

# Output image, Complex_saved_by_OctaDist.png, is stored at ../images directory
```

Fig. 1: Snapshot of structure saved by OctaDist.
4.7 Benchmarks

4.7.1 1. Perfect octahedral complex

Perfect iron metal complex:

</table>

- $d_{\text{mean}} = 1.460000$ Angstrom
- $\zeta = 0.000000$ Angstrom
- $\Delta = 0.000000$
- $\Sigma = 0.00000000$ degree
- $\Theta = 0.00000000$ degree

4.7.2 2. [Fe(1-bpp)2][BF4]2 complex in low-spin state

The XRD structure taken from Malcolm Halcrow’s CCDC library:

<table>
<thead>
<tr>
<th>[Fe(1-bpp)2][BF4]2-LS-Full.xyz</th>
<th>Atom</th>
<th>Cartesian coordinate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fe 4.067400000 7.204000000 13.611700000</td>
<td>N</td>
<td>4.303300000 7.375000000 11.729200000</td>
</tr>
<tr>
<td>N 2.318400000 5.382800000 13.115200000</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- $d_{\text{mean}} = 1.958109$ Angstrom
- $\zeta = 0.203199$ Angstrom
- $\Delta = 0.000348$
- $\Sigma = 86.081494$ degree
- $\Theta = 281.231091$ degree

4.7.3 3. [Fe(1-bpp)2][BF4]2 complex in high-spin state

The XRD structure taken from Malcolm Halcrow’s CCDC library:

<table>
<thead>
<tr>
<th>[Fe(1-bpp)2][BF4]2-HS-Full.xyz</th>
<th>Atom</th>
<th>Cartesian coordinate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fe 4.904900000 6.913500000 14.248000000</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(continues on next page)
• $d_{mean} = 2.178519$ Angstrom
• $\zeta = 0.155914$ Angstrom
• $\Delta = 0.000168$
• $\Sigma = 150.814795$ degree
• $\Theta = 496.648479$ degree

### 4.7.4 4. Very distorted structure

Highly distorted structure:

<table>
<thead>
<tr>
<th>Atom</th>
<th>Cartesian coordinate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fe</td>
<td>18.268051000 11.289120000 2.565804000</td>

</tbody>
</table>

• $d_{mean} = 2.149211$ Angstrom
• $\zeta = 0.082408$ Angstrom
• $\Delta = 0.000066$
• $\Sigma = 182.673342$ degree
• $\Theta = 673.278321$ degree

### 4.8 Error and Fixing

#### 4.8.1 1. OctaDist Startup Slow on Windows?

Windows Defender slow down OctaDist by scanning its file. You can fix this annoying issue by excluding OctaDist out of process scan list.

Here are the steps for adding OctaDist to exclusion list:

1. Go to Start > Settings -> Update & Security -> Virus & threat protection
2. Under Virus & threat protection settings select Manage settings
3. Under Exclusions, select Add or remove exclusions and select Add exclusion
4. Specify the name of OctaDist executable, for example:
5. Close OctaDist and run it again.

### 4.8.2 2. Missing some packages

If error message says *ImportError* or *ModuleNotFoundError*, some important packages have not been installed. To install all required packages, stay at top directory of OctaDist and type this command:

```
$ pip install -r requirements.txt
```

### 4.8.3 3. MPL error

If program crashes with confusing errors messages, you may need to set `MPLBACKEND` environment variable before running the program, like this:

```
export MPLBACKEND=TkAgg
```

### 4.8.4 4. Cannot connect to X11 server

If you run GUI using `octadist` or `octadist_gui` and then it fails with the following error:

```
(py37) nutt@Ubuntu:~$ octadist
Program Starts >>>
... OctaDist 2.6.1 August 2019 ...
Traceback (most recent call last):
  File "/home/nutt/.local/bin/octadist", line 10, in <module>
    sys.exit(run_gui())
  File "/home/nutt/.local/lib/python3.6/site-packages/octadist/__main__.py", line 35, in run_gui
    app = octadist.main.OctaDist()
  File "/home/nutt/.local/lib/python3.6/site-packages/octadist/main.py", line 68, in __init__
    self.master = tk.Tk()
  File "/usr/lib/python3.6/tkinter/__init__.py", line 2023, in __init__
    self.tk = _tkinter.create(screenName, baseName, className, interactive, wantobjects, useTk, sync, use)
_Tkinter.TclError: couldn't connect to display ":0"
```

The above message implies that your system cannot connect to X11 server used for displaying the GUI of program. This error usually happens on Debian or Ubuntu (and Windows Subsystem for Linux on Windows). So, you need to install X11 server as follows:

**X11 Client Installation**

To install the `xauth` package, use `apt-get`:

```
sudo apt-get install xauth
```

**X11 Server Installation**

To install a minimal X11 on Ubuntu Server edition:
suo apt-get install xorg
suo apt-get install openbox

Tip: If you find any issues, do not hesitate to let us know. Your suggestions would help OctaDist getting improved.

4.9 Modules

OctaDist is composed of the following modules:

4.9.1 octadist.main

```python
class octadist.main.OctaDist
    Bases: object

    OctaDist class initiates main program UI and create all widgets.

    Program interface is structured as follows:

    +-----------------+       +-----------------+       +-----------------+       +-----------------+
    | Program Menu    |       | Frame 1          |       | Frame 2          |       | Frame 3          |
    +-----------------+       +-----------------+       +-----------------+       +-----------------+
    | Frame 2         |       | Frame 4          |       |                  |       |                  |
    +-----------------+       +-----------------+       +-----------------+       +-----------------+
    • Frame 1 : Program name and short description
    • Frame 2 : Program console
    • Frame 3 : Textbox for showing summary output
    • Frame 4 : textbox for showing detailed output
```

Examples

```python
>>> my_app = OctaDist()
>>> my_app.start_app()
```

create_logo()

Create icon file from Base64 raw code.

This will be used only for Windows OS.

Other OS like Linux and macOS use default logo of Tkinter.

Examples

```python
>>> if self.octadist_icon is True:
    self.create_logo()
>>> else:
    pass
```
**start_master()**
Start application with UI settings.

**add_menu()**
Add menu bar to master windows.

**add_widgets()**
Add all widgets and components to master windows.
GUI style of widgets in master windows use ttk style.

**show_text**(text)
Insert text to result box

**Parameters**

- **text** *(str)* – Text to show in result box.

**Returns**

- **None** *(None)*

**welcome_msg()**
Show welcome message in result box:

1. Program name, version, and release.
2. Full author names.

**open_file()**
Open file dialog where the user will browse input files.

**search Coord()**
Search and extract atomic symbols and coordinates from input file.

**See also:**

- **octadist.src.molecule.extract_coord()** Extract atomic symbols and atomic coordinates from input file.
- **octadist.src.molecule.extract_octa()** Extract octahedral structure from complex.

**show Coord()**
Show coordinates in box.

**save_results()**
Save results as output file. Default file extension is *.txt.

**save Coord()**
Save atomic coordinates (Cartesian coordinate) of octahedral structure. Default file extension is *.xyz.

**calc_distortion()**
Calculate all distortion parameters:

- D_mean
- Zeta
- Delta
- Sigma
- Theta

**See also:**
octadist.src.calc.CalcDistortion.calc_d_mean() Calculate mean metal-ligand bond length.

octadist.src.calc.CalcDistortion.calc_zeta() Calculate Zeta parameter.

octadist.src.calc.CalcDistortion.calc_delta() Calculate Delta parameter.

octadist.src.calc.CalcDistortion.calc_sigma() Calculate Sigma parameter.

octadist.src.calc.CalcDistortion.calc_theta() Calculate Theta parameter.

**settings()**
Program settings allows the user to configure the values of variables that used in molecular display function.

For example, cutoff distance for screening bond distance between atoms.

**copy_name()**
Copy input file name to clipboard.

*See also:*
  * copy_path(), copy_results(), copy_octa()

**copy_path()**
Copy absolute path of input file to clipboard.

*See also:*
  * copy_name(), copy_results(), copy_octa()

**copy_results()**
Copy the results and computed distortion parameters to clipboard.

*See also:*
  * copy_name(), copy_path(), copy_octa()

**copy_octa()**
Copy atomic coordinates of octahedral structure to clipboard.

*See also:*
  * copy_name(), copy_path(), copy_results()

**edit_file()**
Edit file by specified text editor on Windows.

*See also:*
  * settings()

**scripting_console()**
Start scripting interface for an interactive code.

User can access to class variable (dynamics variable).

见 also:

---

4.9. Modules

---

**Output box**

**Input box**

---

**settings()** Program settings.
draw_all_atom()
Display 3D complex.
See also:

octadist.src.draw.DrawComplex() Show 3D molecule.

draw_all_atom_and_face()
Display 3D complex with the faces.
See also:

octadist.src.draw.DrawComplex() Show 3D molecule.

draw_octa()
Display 3D octahedral structure.
See also:

octadist.src.draw.DrawComplex() Show 3D molecule.

draw_octa_and_face()
Display 3D octahedral structure with the faces.
See also:

octadist.src.draw.DrawComplex() Show 3D molecule.

draw_projection()
Draw projection planes.
See also:

octadist.src.draw.DrawProjection() Show graphical projections.

draw_twisting_plane()
Draw twisting triangular planes.
See also:

octadist.src.draw.DrawTwistingPlane() Show graphical triangular twisting planes.

show_data_complex()
Show info of input complex.
See also:

octadist.src.structure.DataComplex() Show data summary of complex.

show_param_octa()
Show structural parameters of selected octahedral structure.
See also:

octadist.src.structure.StructParam() Show structural parameter summary of complex.
show_surface_area()
Calculate the area of eight triangular faces of octahedral structure.

See also:

octadist.src.structure.SurfaceArea() Show the area of the faces of octahedral structure.

plot_zeta_sigma()
Plot relationship between zeta and sigma.

See also:

octadist.src.plot.Plot() Show relationship plot.

plot_sigma_theta()
Plot relationship between sigma and theta.

See also:

octadist.src.plot.Plot() Show relationship plot.

tool_jahn_teller()
Calculate Jahn-Teller distortion parameter.

See also:

tool_rmsd()
Calculate root mean squared displacement of atoms in complex, RMSD.

See also:

octadist.src.tools.CalcRMSD() Calculate RMSD.

static check_update()
Check program update by comparing version of program user is using with that of the latest version released on github.

References

static callback(event)
On-click open web browser.

Parameters event (object) – Event object for callback.

show_help()
Show program help on a sub-window:

1. Simple usage
2. XYZ file format
3. References

static show_about()
Show author details on a sub-window.
1. Name of authors
2. Official program website
3. Citation

`static show_license()`  
Show license details on a sub-window.
GNU General Public License version 3.0.

**References**

[Link: https://www.gnu.org/licenses/gpl-3.0.en.html.]

`clear_cache()`  
Clear program cache by nullifying all default variables and clear both of parameter and result boxes.

`clear_param_box()`  
Clear parameter box.

`clear_result_box()`  
Clear result box.

`start_app()`  
Start application.

### 4.9.2 octadist.gui

### 4.9.3 octadist.cli

`octadist.octadist_cli.check_file(file)`  
Check if input file is exist or not.

**Parameters**

- `file (str)` – Input file name.

**Returns**

- `file (str)` – Input file name.

`octadist.octadist_cli.find_coord(file)`  
Find atomic symbols and atomic coordinates of structure.

**Parameters**

- `file (str)` – Input file name.

**Returns**

- `atom (list)` – Atomic symbols.
- `coord (list)` – Atomic coordinates.

`octadist.octadist_cli.find_octa(atom, coord)`  
Find atomic symbols and atomic coordinates of structure.

**Parameters**

- `atom (list)` – Atomic symbols of structure.
- `coord (list)` – Atomic coordinates of structure.

**Returns**

- `atom (list)` – Atomic symbols of octahedral structure.
- `coord (ndarray)` – Atomic coordinates of octahedral structure.
octadist.octadist_cli.calc_param(coord)
   Calculate octahedral distortion parameters.
   Parameters coord(array_like) – Atomic coordinates of octahedral structure.
   Returns computed (dict) – Computed parameters.

octadist.octadist_cli.run_cli()
   OctaDist command-line interface (CLI). This function has been implemented by entry points function in setup-tools package.

4.9.4 octadist.calc

class octadist.src.calc.CalcDistortion(coord)
   Bases: object
   Calculate distortion parameters: - Bond distance - Mean bond distance - Bond angle around metal center atom
   - Delta parameter - Sigma parameter - Minimum, maximum, and mean Theta parameters
   Parameters coord(array_like) – Atomic coordinates of octahedral structure.

Examples

```python
>>> coord = [[2.298354000, 5.161785000, 7.971898000],  # <- Metal atom
           [1.885657000, 4.804777000, 6.183726000],
           [1.747515000, 6.960963000, 7.932784000],
           [4.094380000, 5.807257000, 7.588689000],
           [0.539005000, 4.482809000, 8.460004000],
           [2.812425000, 3.266553000, 8.131637000],
           [2.886404000, 5.392925000, 9.848966000]]
>>> test = CalcDistortion(coord)
>>> test.sigma
47.926528379270124
```

calc_d_bond()  
   Calculate metal-ligand bond distance and return value in Angstrom.
   See also:
   calc_d_mean()  Calculate mean metal-ligand bond length.

calc_d_mean()  
   Calculate mean distance parameter and return value in Angstrom.
   See also:
   calc_d_bond()  Calculate metal-ligand bonds length.

calc_bond_angle()  
   Calculate 12 cis and 3 trans unique angles in octahedral structure.
   See also:
   calc_sigma()  Calculate Sigma parameter.
calc_zeta()  
Calculate Zeta parameter and return value in Angstrom.  
See also:  
  calc_d_bond()  Calculate metal-ligand bonds length.  
  calc_d_mean()  Calculate mean metal-ligand bond length.  

References  

calc_delta()  
Calculate Delta parameter, also known as Tilting distortion parameter.  
See also:  
  calc_d_bond()  Calculate metal-ligand bonds length.  
  calc_d_mean()  Calculate mean metal-ligand bond length.  

References  

calc_sigma()  
Calculate Sigma parameter and return value in degree.  
See also:  
  calc_bond_angle()  Calculate bond angles between ligand-metal-ligand.  

References  

determine_faces()  
Refine the order of ligand atoms in order to find the plane for projection.  

Returns  
  • coord_metal (nd.array) – Coordinate of metal atom.  
  • coord_lig (nd.array) – Coordinate of ligand atoms.  
See also:  
  calc_theta()  Calculate mean Theta parameter  

Examples

```python
>>> bef = np.array([[4.0674, 7.2040, 13.6117]
                   [4.3033, 7.3750, 11.7292]
                   [3.8326, 6.9715, 15.4926]
                   [5.8822, 6.4461, 13.4312]
                   [3.3002, 5.3828, 13.6316]
                   [4.8055, 8.9318, 14.2716]
                   [2.3184, 8.0165, 13.1152]])
```
>>> metal, coord = self.determine_faces(bef)
>>> metal
[ 4.0674  7.204  13.6117]

coord_lig
[ [ 4.3033  7.375  11.7292]  # Front face
 [ 4.8055  8.9318  14.2716]  # Front face
 [ 5.8822  6.4461  13.4312]  # Front face
 [ 2.3184  8.0165  13.1152]  # Back face
 [ 3.8326  6.9715  15.4926]  # Back face
 [ 3.3002  5.3828  13.6316]]  # Back face

calc_theta()
Calculate Theta parameter and value in degree.

See also:

calc_theta_min() Calculate minimum Theta parameter.
calc_theta_max() Calculate maximum Theta parameter.
octadist.src.linear.angle_btw_vectors() Calculate cosine angle between two vectors.
octadist.src.linear.angle_sign() Calculate cosine angle between two vectors sensitive to CW/CCW direction.
octadist.src.plane.find_eq_of_plane() Find the equation of the plane.
octadist.src.projection.project_atom_onto_plane() Orthogonal projection of point onto the plane.

References

calc_theta_min()
Calculate minimum Theta parameter and return value in degree.

See also:

calc_theta() Calculate mean Theta parameter

calc_theta_max()
Calculate maximum Theta parameter and return value in degree.

See also:

calc_theta() Calculate mean Theta parameter

4.9.5 octadist.draw

class octadist.src.draw.DrawComplex (atom=None, coord=None, cutoff_global=2.0, cutoff_hydrogen=1.2)

Bases: object

Display 3D structure of octahedral complex with label for each atoms.

Parameters

• atom(list, None) – Atomic symbols of octahedral structure.
• **coord** (*list, array, tuple, bool, None*) – Atomic coordinates of octahedral structure.

• **cutoff_global** (*int or float*) – Global cutoff for screening bonds. Default value is 2.0.

• **cutoff_hydrogen** (*int or float*) – Cutoff for screening hydrogen bonds. Default value is 1.2.

### Examples

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
            [1.885657000, 4.804777000, 6.183726000],
            [1.747515000, 6.960963000, 7.932784000],
            [4.094380000, 5.807257000, 7.588689000],
            [0.539005000, 4.482809000, 8.460004000],
            [2.812425000, 3.266553000, 8.131637000],
            [2.886404000, 5.392925000, 9.848966000]]
>>> test = DrawComplex(atom=atom, coord=coord)
>>> test.add_atom()
>>> test.add_bond()
>>> test.add_legend()
>>> test.show_plot()
```

**start_plot()**  
Introduce figure to plot.

**add_atom()**  
Add all atoms to show in figure.

**add_symbol()**  
Add symbol of atoms to show in figure.

**add_bond()**  
Calculate bond distance, screen bond, and add them to show in figure.

See also:

- `octadist.src.util.find_bonds()` Find atomic bonds.

**add_face**(coord)  
Find the faces of octahedral structure and add those faces to show in figure.

See also:

- `octadist.src.util.find_faces_octa()`

**add_legend()**  
Add atoms legend to show in figure.

### References

**config_plot**

```python
(show_title=True, show_axis=True, show_grid=True, **kwargs)
```

Setting configuration for figure.

**Parameters**

- **show_title** *(bool)* – If True, show title of figure. If False, not show title of figure.
- **show_axis** *(bool)* – If True, show axis of figure. If False, not show axis of figure.
- **show_grid** *(bool)* – If True, show grid of figure. If False, not show grid of figure.
- **kwargs** *(dict (optional))* – title_name : title name of figure. title_size : text size of title. label_size : text size of axis labels.

**static save_img**

```python
(save='Complex_saved_by_OctaDist', file='png')
```

Save figure as an image.

**Parameters**

- **save** *(str)* – Name of image file. Default value is “Complex_saved_by_OctaDist”.
- **file** *(file)* – Image type. Default value is “png”.

**static show_plot**

Show plot.

**class octadist.src.draw.DrawProjection(**kwargs)

**Bases:** object

Display the selected 4 faces of octahedral complex.

**Parameters**

- **atom** *(list)* – Atomic symbols of octahedral structure.
- **coord** *(list, array, tuple)* – Atomic coordinates of octahedral structure.

**Examples**

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
           [1.885657000, 4.804777000, 6.183726000],
           [1.747515000, 6.960963000, 7.932784000],
           [4.094380000, 5.807257000, 7.588689000],
           [0.539005000, 4.482809000, 8.460004000],
           [2.812425000, 3.266553000, 8.131637000],
           [2.886404000, 5.392925000, 9.848966000]]
>>> test = DrawProjection(atom=atom, coord=coord)
>>> test.add_atom()
>>> test.add_symbol()
>>> test.add_plane()
>>> test.show_plot()
```

**start_plot**

Introduce figure to plot.

**shift_plot**

Shift subplots down. Default value is 0.25.

**add_atom**

Add all atoms to show in figure.
add_symbol()
Add all atoms to show in figure.

add_plane()
Add the projection planes to show in figure.

See also:
\texttt{octadist.src.util.find\_faces\_octa()}

\textbf{static save\_img}(save='Complex\_saved\_by\_OctaDist', file='png')
Save figure as an image.

Parameters
\begin{itemize}
\item \texttt{save}(str) – Name of image file. Default value is “Complex\_saved\_by\_OctaDist”.
\item \texttt{file}(file) – Image type. Default value is “png”.
\end{itemize}

\textbf{static show\_plot()}
Show plot.

class \texttt{octadist.src.draw.DrawTwistingPlane(**kwargs)}
\texttt{Bases: object}
Display twisting triangular faces and vector projection.

Parameters
\begin{itemize}
\item \texttt{atom}(list) – Atomic symbols of octahedral structure.
\item \texttt{coord}(list, array, tuple) – Atomic coordinates of octahedral structure.
\end{itemize}

\textbf{Examples}

\begin{Verbatim}
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
            [1.885657000, 4.804777000, 6.183726000],
            [1.747515000, 6.960963000, 7.932784000],
            [4.094380000, 5.807257000, 7.588689000],
            [0.539005000, 4.482809000, 8.460004000],
            [2.812425000, 3.266553000, 8.131637000],
            [2.886404000, 5.392925000, 9.848966000]]
>>> test = DrawTwistingPlane(atom=atom, coord=coord)
>>> test.add\_plane()
>>> test.add\_symbol()
>>> test.add\_bond()
>>> test.show\_plot()
\end{Verbatim}

\textbf{start\_plot()}
Introduce figure to plot.

\textbf{shift\_plot()}
Shift subplots down. Default value is 0.25.

\textbf{create\_subplots()}
Create subplots.

\textbf{add\_plane()}
Add the projection planes to show in figure.

See also:
octadist.src.plane.find_eq_of_plane()  Find the equation of the plane.

octadist.src.projection.project_atom_onto_plane()  Orthogonal projection of point onto the plane.

add_symbol()  
Add all atoms to show in figure.

add_bond()  
Calculate bond distance, screen bond, and add them to show in figure.

static save_img(save='Complex_saved_by_OctaDist', file='png')  
Save figure as an image.

Parameters  
• save (str) – Name of image file. Default value is "Complex_saved_by_OctaDist".
• file (file) – Image type. Default value is "png".

static show_plot()  
Show plot.

4.9.6 octadist.elements

octadist.src.elements.check_atom(x)  
Convert atomic number to symbol and vice versa for atom 1-109.

Parameters x (str or int) – symbol or atomic number.

Returns  
• atom[x] (str) – If x is atomic number, return symbol.
• atom.index(i) (int) – If x is symbol, return atomic number.

Examples

```python
>>> check_atom('He')
2
```

```python
>>> check_atom(2)
'He'
```

octadist.src.elements.check_radii(x)  
Convert atomic number (index) to atom radii in Angstroms: 1-119.

Parameters x (int) – Atomic number.

Returns atom_radii[x] (int) – Atomic radius.

Examples

```python
>>> check_radii(2)  # He
0.93
```

octadist.src.elements.check_color(x)  
Convert atomic number to color: 1-109.
Parameters  \( x (\text{int}) \) – Atomic number.

Returns  \text{atomic color}[x] (\text{str}) – Atomic color.

References

http://jmol.sourceforge.net/jscolors/

Examples

```python
>>> check_color(2)  # He
'\#D9FFFF'
```

4.9.7  \textit{octadist.linear}

\texttt{octadist.src.linear\_angle\_sign(v1, v2, direct)}

Compute angle between two vectors with sign and return value in degree.

Parameters

- \( v1 (\text{array\_like}) \) – Vector in 3D space.
- \( v2 (\text{array\_like}) \) – Vector in 3D space.
- \( \text{direct} (\text{array}) \) – Vector that refers to orientation of the plane.

Returns  \text{angle} (float64) – Angle between two vectors in degree unit with sign.

See also:

calc.calc_theta()

Examples

```python
>>> vector1 = [1.21859514, -0.92569245, -0.51717955]
>>> vector2 = [1.02186387, 0.57480095, -0.95220433]
>>> direction = [1.29280503, 0.69301873, 1.80572438]
>>> angle_sign(vector1, vector2, direction)
60.38697927455357
```

\texttt{octadist.src.linear\_angle\_btw\_vectors(v1, v2)}

Compute angle between two vectors and return value in degree.

Parameters

- \( v1 (\text{array\_like}) \) – Vector in 3D space.
- \( v2 (\text{array\_like}) \) – Vector in 3D space.

Returns  \text{angle} (float64) – Angle between two vectors in degree unit.

Examples
angle_btw_vectors(vector1, vector2)

95.62773246517462

octadist.src.linear.angle_btw_planes(al, bl, cl, a2, b2, c2)

Find the angle between 2 planes in 3D and return value in degree.

General equation of plane:

\[ aX + bY + cZ + d = 0 \]

**Parameters**

- \( b1, c1 \ (a1) \) – Coefficient of the equation of plane 1.
- \( b2, c2 \ (a2) \) – Coefficient of the equation of plane 2.

**Returns** angle (float64) – Angle between 2 planes in degree unit.

**Examples**

```python
>>> # Plane 1
>>> a1 = -3.231203733528
>>> b1 = -0.9688526458499996
>>> c1 = 0.9391692927779998
>>> # Plane 2
>>> a2 = 1.3904813057000005
>>> b2 = 3.928502357473003
>>> c2 = -4.924114034864001
>>> angle_btw_planes(a1, b1, c1, a2, b2, c2)
124.89920902358416
```

triangle_area(a, b, c)

Calculate the area of the triangle using the cross product:

\[ \text{Area} = \frac{\text{abs}(ab \times ac)}{2} \]

where vector \( ab = b - a \) and vector \( ac = c - a \).

**Parameters**

- \( a \ (array\_like) \) – 3D Coordinate of point.
- \( b \ (array\_like) \) – 3D Coordinate of point.
- \( c \ (array\_like) \) – 3D Coordinate of point.

**Returns** area (float64) – The triangle area.
Examples

```python
>>> # Three vertices
>>> a = [2.298354000, 5.161785000, 7.971898000]
>>> b = [1.885657000, 4.804777000, 6.183726000]
>>> c = [1.747515000, 6.960963000, 7.932784000]
>>> triangle_area(a, b, c)
1.7508135235821773
```

4.9.8 octadist.molecule

octadist.src.molecule.is_xyz(f)
Check if the input file is .xyz file format.

Parameters

- f (str) – User input filename.

Returns

- bool (bool) – If file is XYZ file, return True.

See also:

- `get_coord_xyz()` Find atomic coordinates of molecule from XYZ file.

Notes

XYZ file format is like following:

```plaintext
>>> # Example XYZ file format
<number of atom>
comment
<index 0> <X> <Y> <Z>
<index 1> <X> <Y> <Z>
...
<index 6> <X> <Y> <Z>
```

Examples

```python
>>> example.xyz
7
Comment: From Excel file
Fe 6.251705 9.063211 5.914842
N 8.15961 9.066456 5.463087
N 6.749414 10.457551 7.179682
N 5.709997 10.492955 4.658257
N 4.350474 9.106286 6.356091
O 5.789096 7.796326 4.611355
O 6.686381 7.763872 7.209699
>>> is_xyz(example.xyz)
True
```

octadist.src.molecule.get_coord_xyz(f)
Get coordinate from .xyz file.

Parameters

- f (str) – User input filename.

Returns
OctaDist Documentation, Release 2.6.1

- **atom** (*list*) – Full atomic labels of complex.
- **coord** (*ndarray*) – Full atomic coordinates of complex.

octadist.src.molecule.is_gaussian(*f*)
Check if the input file is Gaussian file format.

**Parameters**

- **f** (*str*) – User input filename.

**Returns**

- **bool** – If file is Gaussian output file, return True.

**See also:**

get_coord_gaussian() Find atomic coordinates of molecule from Gaussian file.

**Examples**

```python
>>> gaussian.log

<table>

</tr>
</tbody>
</table>

...```

octadist.src.molecule.get_coord_gaussian(*f*)
Extract XYZ coordinate from Gaussian output file.

**Parameters**

- **f** (*str*) – User input filename.

**Returns**

- **atom** (*list*) – Full atomic labels of complex.
- **coord** (*ndarray*) – Full atomic coordinates of complex.

octadist.src.molecule.is_nwchem(*f*)
Check if the input file is NWChem file format.

**Parameters**

- **f** (*str*) – User input filename.

**Returns**

- **bool** – If file is NWChem output file, return True.

**See also:**

get_coord_nwchem() Find atomic coordinates of molecule from NWChem file.

**Examples**

```python
>>> nwchem.out

Optimization converged

...```

octadist.src.molecule.get_coord_nwchem(f)
Extract XYZ coordinate from NWChem output file.

Parameters f (str) – User input filename.

Returns
- atom (list) – Full atomic labels of complex.
- coord (ndarray) – Full atomic coordinates of complex.

octadist.src.molecule.is_orca(f)
Check if the input file is ORCA file format.

Parameters f (str) – User input filename.

Returns bool (bool) – If file is ORCA output file, return True.

See also:

get_coord_orca() Find atomic coordinates of molecule from ORCA file.

Examples

```bash
>>> orca.out
---------------------------------
CARTESIAN COORDINATES (ANGSTROEM)
---------------------------------
C  0.009657  0.000000  0.005576
C  0.009657  -0.000000  1.394424
C  1.212436  -0.000000  2.088849
C  2.415214  0.000000  1.394425
C  2.415214  -0.000000  0.005575
...```

octadist.src.molecule.get_coord_orca(f)
Extract XYZ coordinate from ORCA output file.

Parameters f (str) – User input filename.

Returns
- atom (list) – Full atomic labels of complex.
- coord (ndarray) – Full atomic coordinates of complex.

octadist.src.molecule.is_qchem(f)
Check if the input file is Q-Chem file format.

Parameters f (str) – User input filename.
Returns `bool` (`bool`) – If file is Q-Chem output file, return True.

See also:

`get_coord_qchem()` Find atomic coordinates of molecule from Q-Chem file.

**Examples**

```python
>>> qchem.out

```

`octadist.src.molecule.get_coord_qchem(f)`
Extract XYZ coordinate from Q-Chem output file.

**Parameters**

- `f` (*str*) – User input filename.

**Returns**

- `atom` (*list*) – Full atomic labels of complex.

`octadist.src.molecule.count_line(file=None)`
Count lines in an input file.

**Parameters**

- `file` (*str*) – Absolute or full path of input file.

**Returns**

- `i + 1` (*int*) – Number of line in file.

**Examples**

```python
>>> file = "/home/ิน/Jack/[Fe(1-bpp)2][BF4]2-HS.xyz"
>>> count_line(file)
27
```

`octadist.src.molecule.extract_coord(file=None)`
Check file type, read data, extract atom and coord from an input file.

**Parameters**

- `file` (*str*) – User input filename.

**Returns**

- `atom` (*list*) – Full atomic labels of complex.

See also:

`octadist.main.OctaDist.open_file()` Open file dialog and to browse input file.

Notes

The following is the file type that OctaDist supports:

- XYZ
- Gaussian
- NWChem
- ORCA
- Q-Chem

Examples

```python
>>> file = "/home/Jack/[Fe(1-bpp)2][BF4]2-HS.xyz"
>>> atom, coord = extract_coord(file)
>>> atom
['Fe', 'N', 'N', 'N', 'N', 'N', 'N']
>>> coord
[[-1.95348286e+00, 4.51770478e+00, 1.47855811e+01],
[-1.87618286e+00, 4.48070478e+00, 1.26484811e+01],
[-3.90128286e+00, 5.27750478e+00, 1.40814811e+01],
[-4.88286000e-03, 3.69060478e+00, 1.42392811e+01],
[-2.18698286e+00, 4.34540478e+00, 1.69060811e+01],
[-1.17538286e+00, 6.38340478e+00, 1.56457811e+01],
[-2.75078286e+00, 2.50260478e+00, 1.51806811e+01]]
```

costadist.src.molecule.find_metal(atom=None, coord=None)
Count the number of metal center atom in complex.

Parameters

- **atom** (list, None) – Full atomic labels of complex.
- **coord** (array_like, None) – Full atomic coordinates of complex.

Returns

- **total_metal** (int) – The total number of metal center atom.
- **atom_metal** (list) – Atomic labels of metal center atom.
- **coord_metal** (ndarray) – Atomic coordinates of metal center atom.

See also:

octadist.src.elements.check_atom() Convert atomic number to atomic symbol and vice versa.

Examples

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'N', 'N', 'N']
>>> coord = [[-1.95348286e+00, 4.51770478e+00, 1.47855811e+01],
[-1.87618286e+00, 4.48070478e+00, 1.26484811e+01],
[-3.90128286e+00, 5.27750478e+00, 1.40814811e+01],
[-3.90128286e+00, 5.27750478e+00, 1.40814811e+01],
[-2.18698286e+00, 4.34540478e+00, 1.69060811e+01],
[-1.17538286e+00, 6.38340478e+00, 1.56457811e+01],
[-2.75078286e+00, 2.50260478e+00, 1.51806811e+01]]
```
octadist.src.molecule.extract_octa(atom=None, coord=None, metal=1, cutoff_metal_ligand=2.8)

Search the octahedral structure in complex and return atoms and coordinates.

**Parameters**

- `atom (list)` – Full atomic labels of complex.
- `coord (array_like)` – Full atomic coordinates of complex.
- `metal (int)` – Number of metal atom that will be taken as center atom for finding atomic coordinates of octahedral structure of interest. Default value is 1.
- `cutoff_metal_ligand (float, optional)` – Cutoff distance for screening metal-ligand bond. Default value is 2.8.

**Returns**

- `atom_octa (list)` – Atomic labels of octahedral structure.
- `coord_octa (ndarray)` – Atomic coordinates of octahedral structure.

See also:

- `find_metal()` Find metals in complex.

**Examples**

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'N', 'N', 'N']
>>> coord = [[-1.95348286e+00, 4.51770478e+00, 1.47855811e+01],
           [-1.87618286e+00, 4.48070478e+00, 1.26484811e+01],
           [-3.90128286e+00, 5.27750478e+00, 1.40814811e+01],
           [-4.88286000e+00, 3.69060478e+00, 1.42392811e+01],
           [-2.18698286e+00, 4.34540478e+00, 1.69060811e+01],
           [-1.17538286e+00, 6.38340478e+00, 1.56457811e+01],
           [-2.75078286e+00, 2.50260478e+00, 1.51806811e+01]]
>>> atom_octa, coord_octa = extract_octa(atom, coord)
>>> atom_octa
['Fe', 'N', 'N', 'N', 'N', 'N', 'N']
>>> coord_octa
[[-1.95348286 4.51770478 14.78558113],

```
4.9.9 octadist.plane

Find the equation of plane of given three points using cross product

The general form of plane equation:

\[ Ax + By + Cz = D \]

where A, B, C, and D are coefficient.

\[ XZ X XY = (a, b, c) \]

\[ d = (a, b, c).Z \]

Parameters

• `x (array_like)` – 3D Coordinate of point.
• `y (array_like)` – 3D Coordinate of point.
• `z (array_like)` – 3D Coordinate of point.

Returns

• `a (float64)` – Coefficient of the equation of the plane.
• `b (float64)` – Coefficient of the equation of the plane.
• `c (float64)` – Coefficient of the equation of the plane.
• `d (float64)` – Coefficient of the equation of the plane.

Examples

```python
>>> N1 = [2.298354000, 5.161785000, 7.971898000]
>>> N2 = [1.885657000, 4.804777000, 6.183726000]
>>> N3 = [1.747515000, 6.960963000, 7.932784000]
>>> a, b, c, d = find_eq_of_plane(N1, N2, N3)
>>> a
-3.231203733528
>>> b
-0.9688526458499996
>>> c
0.9391692927779998
>>> d
-4.940497273569501
```
octadist.src.plane.find_fit_plane(coord)
Find best fit plane to the given data points (atoms).
scipy.optimize.minimize is used to find the least-square plane.

Parameters
coord(array_like) – Coordinates of selected atom chunk.

Returns
• xx (float) – Coefficient of the surface.
• yy (float) – Coefficient of the surface.
• z (float) – Coefficient of the surface.
• abcd (tuple) – Coefficient of the equation of the plane.

Examples

```python
>>> points = [(1.1, 2.1, 8.1),
            (3.2, 4.2, 8.0),
            (5.3, 1.3, 8.2),
            (3.4, 2.4, 8.3),
            (1.5, 4.5, 8.2),
            (5.5, 6.7, 4.5)]
>>> # To plot the plane, run following commands:
>>> import matplotlib.pyplot as plt
>>> # map coordinates for scattering plot
>>> xs, ys, zs = zip(*points)
>>> plt.scatter(xs, ys, zs)
>>> plt.show()
```

4.9.10 octadist.plot

class octadist.src.plot.Plot(*args, name1='Var1', name2='Var2')

Bases: object

Relationship plot between Zeta and Sigma parameters.

Parameters

• args[0](list) – List of data set 1 (data1).
• = list(args[0]) – List of data set 2 (data2).
• = str, optional (name2) – Name of data set 1.
• = str, optional – Name of data set 2.

Examples

```python
>>> data1 = [1, 2, 3, 4, 5]
>>> data2 = [1, 2, 3, 4, 5]
>>> test = Plot(data1, data2, name1="Data 1", name2="Data 2")
>>> test.add_point()
>>> test.add_text()
```
start_plot()
    Start plot.

dot_point()
    Add all atoms to show in figure.

dot_text()
    Added text to show in figure.

dot_legend()
    Add legend to show in figure.

cfg_plot()
    Config structure of figure.

dot_label()
    Set title of figure and axis labels.

dot_save_img(save='Image_saved_by_OctaDist', file='png')
    Save figure as an image.

Parameters
    • save(str) – Name of image file. Default value is “Complex_saved_by_OctaDist”.
    • file(str) – Image type. Default value is “png”.

dot_show_plot()
    Show plot.

4.9.11 octadist.popup

octadist.src.popup.err_no_file()
    Show this error when having no any input files is loaded into program.

octadist.src.popup.err_invalid_ftype()
    Show this error popup when file type is not supported by the program.

octadist.src.popup.err_no_coord(i)
    Show this error popup when the program cannot read the atomic coordinates of complex inside the file or cannot extract the coordinates from the complex.

This will happen only if the input has no the proper format of atomic coordinates.

Parameters
    • i(int) – Number of file.

octadist.src.popup.err_less_ligands(i)
    Show this error popup when the complex has ligand atoms less that six.

Parameters
    • i(int) – Number of file.

octadist.src.popup.err_no_metal()
    Show this error popup when the complex has no transition metal atom.

octadist.src.popup.err_no_calc()
    Show this error popup when the user requests function that the results are required, but the results have not been computed yet.
octadist.src.popup.err_only_2_files()  
Show this error popup when having not uploaded two complexes for using the RMSD function.

octadist.src.popup.err_not_equal_atom()  
Show this error popup when the total number of atoms of two complexes are not equal.

octadist.src.popup.err_atom_not_match(line)  
show this error popup when atomic symbol of two similar complexes does not match.

Parameters line (int) – The line number that atomic symbol does not match.

octadist.src.popup.err_many_files()  
Show this error popup when user has loaded too many files.

octadist.src.popup.err_wrong_format()  
Show this error popup when user has loaded the file that is not supported by OctaDist.

octadist.src.popup.err_no_editor()  
Show this error popup if text editor path is empty.

octadist.src.popup.err_cannot_update()  
Show this error popup when the program cannot detect the operating system of the machine that user is using.

octadist.src.popup.info_save_results(file)  
Show info popup:

  show this info popup when output file has been saved successfully.

Parameters file (str) – Absolute or full path of saved output file.

octadist.src.popup.info_new_update()  
Show this info popup when new version is available for update.

octadist.src.popup.info_using_dev()  
Show this info popup if user is using a development build version.

octadist.src.popup.info_no_update()  
Show this info popup if program is the latest version.

octadist.src.popup.warn_no_metal(i)  
Show this warning popup if no transition metal was found.

Parameters i (int) – Number of file.

octadist.src.popup.warn_not_octa()  
Show this warning popup if the complex is non-octahedral structure.

### 4.9.12 octadist.projection

octadist.src.projection.project_atom_onto_line(p, a, b)  
Find the point projection on the line, which defined by two distinct end points.

\[
a \implies b
\]

\[
P(x) = x_1 + (p - x_1).\frac{(x_2 - x_1)}{(x_2 - x_1)}(x_2 - x_1) * (x_2 - x_1)
\]

Parameters

- p (array_like) – Coordinate of point to project.
\* a (array_like) – Coordinate of head atom of the line.
\* b (array_like) – Coordinate of tail atom of the line.

Returns **projected_point** (ndarray) – The projected point on the orthogonal line.

### Examples

```python
>>> # point to project
>>> p = [10.1873, 5.7463, 5.615]
>>> # head and end points of line
>>> a = [8.494, 5.9735, 4.8091]
>>> b = [9.6526, 6.4229, 7.3079]
>>> project_atom_onto_line(p, a, b)
[9.07023235 6.19701012 6.05188388]
```

octadist.src.projection.project_atom_onto_plane (p, a, b, c, d)

Find the orthogonal vector of point onto the given plane. The equation of plane is \( Ax + By + Cz = D \) and point is \( (L, M, N) \), then the location on the plane that is closest to the point \( (P, Q, R) \) is

\[
(P, Q, R) = (L, M, N) + \lambda \* (A, B, C)
\]

where \( \lambda = (D - (A*L + B*M + C*N)) / (A^2 + B^2 + C^2) \).

Parameters

- **p** (array_like) – Point to project.
- **a** (int or float) – Coefficient of the equation of the plane.
- **b** (int or float) – Coefficient of the equation of the plane.
- **c** (int or float) – Coefficient of the equation of the plane.
- **d** (int or float) – Coefficient of the equation of the plane.

Returns **projected_point** (ndarray) – The projected point on the orthogonal plane.

### Examples

```python
>>> # point to project
>>> p = [10.1873, 5.7463, 5.615]
>>> # coefficient of the equation of the plane
>>> a = -3.231203733528
>>> b = -0.9688526458499996
>>> c = 0.9391692927779998
>>> d = -4.940497273569501
>>> project_atom_onto_plane(p, a, b, c, d)
[2.73723598 3.51245316 7.78040705]
```

4.9.13 octadist.scripting

class octadist.src.scripting.ScriptingConsole (root)
    Bases: object
Start scripting interface for an interactive code.
User can access to class variable (dynamics variable).

Parameters `root (object)` – Passing self object from another class to this class as root argument.

See also:

`settings` Program settings.

**Examples**

```python
>>> import tkinter as tk
>>> master = tk.Tk()
>>> console = ScriptingConsole(master)
>>> console.scripting_start()
```

### Parameters

- **root** (object) – Passing self object from another class to this class as root argument.

### Examples

```python
>>> import tkinter as tk
>>> master = tk.Tk()
>>> console = ScriptingConsole(master)
>>> console.scripting_start()
```

`scripting_start ()`
Start scripting console.

`script_run_help ()`
Show help messages.

`script_run_list ()`
Show list of commands in scripting run.

`script_run_info ()`
Show info of program.

`script_run_doc ()`
Show document of program.

`script_run_show (args)`
Show value of variable that user requests.

**Parameters** `args` (str) – Arbitrary argument.

`script_run_type (args)`
Show data type of variable.

**Parameters** `args` (str) – Arbitrary argument.

`script_run_set (args)`
Set new value to variable.

**Parameters** `args` (str) – Arbitrary argument.

`script_run_clear ()`
Clear output box.

`script_run_clean (args)`
Clear output box and clean variable.

`script_run_restore ()`
Restore all default settings.
script_run_history()  
Show history of command.

script_no_command(command)  
Show statement if command not found.

Parameters  
command (str) – Command that user submits.

script_execute(event)  
Execute input command scripting.

Parameters  
event (object) – Object for button interaction

4.9.14 octadist.structure

class octadist.src.structure.DataComplex(master=None, icon=None)  
Bases: object  

Show info of input complex.

Parameters  

• master (object, optional) – If None, use tk.Tk(). If not None, use tk.Toplevel(master).

• icon (str, optional) – If None, use tkinter default icon. If not None, use user-defined icon.

Examples

```python
>>> file = "File_1"
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
[1.885657000, 4.804777000, 6.183726000],
[1.747515000, 6.960963000, 7.932784000],
[4.094380000, 5.807257000, 7.588689000],
[0.539005000, 4.482809000, 8.460004000],
[2.812425000, 3.266553000, 8.131637000],
[2.886404000, 5.392925000, 9.848966000]]
>>> my_app = DataComplex()
>>> my_app.add_name(file)
>>> my_app.add_coord(atom, coord)
```

start_app()  
Start application.

add_name (file_name)  
Add file name to box.

Parameters  
file_name (array_like) – List containing the names of all input files.

add_coord (atom, coord)  
Add atomic symbols and coordinates to box.

Parameters  

• atom (array_like) – Atomic labels of full complex.

• coord (array_like) – Atomic coordinates of full complex.
class octadist.src.structure.StructParam(master=None, icon=None)

Bases: object

Show structural parameters of structure.

Parameters

- master (object, optional) – If None, use tk.Tk(). If not None, use tk.Toplevel(master).
- icon (str, optional) – If None, use tkinter default icon. If not None, use user-defined icon.

Examples

```python
>>> metal = 'Fe'
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
            [1.885657000, 4.804777000, 6.183726000],
            [1.747515000, 6.960963000, 7.932784000],
            [4.094380000, 5.807257000, 7.588689000],
            [0.539005000, 4.482809000, 8.460004000],
            [2.812425000, 3.266553000, 8.131637000],
            [2.886404000, 5.392925000, 9.848966000]]
>>> my_app = StructParam()
>>> my_app.add_metal(metal)
>>> my_app.add_coord(atom, coord)

start_app()
    Start application.

add_number (number)
    Add file number to box.

    Parameters
    number (int) – File number.

add_metal (metal)
    Add metal atom to box:

    Parameters
    metal (str) – Metal atom.

add_coord (atom, coord)
    Add atomic symbols and coordinates to box.

    Parameters
    atom (array_like) – Atomic labels of full complex.
    coord (array_like) – Atomic coordinates of full complex.
```

class octadist.src.structure.SurfaceArea(master=None, icon=None)

Bases: object

Find the area of the faces of octahedral structure.

Three ligand atoms are vertices of triangular face

Parameters

- master (object, optional) – If None, use tk.Tk(). If not None, use tk.Toplevel(master).
• **icon**(str, optional) – If None, use tkinter default icon. If not None, use user-defined icon.

**Examples**

```python
>>> metal = 'Fe'
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
            [1.885657000, 4.804777000, 6.183726000],
            [1.747515000, 6.960963000, 7.932784000],
            [4.094380000, 5.807257000, 7.588689000],
            [0.539005000, 4.828090000, 8.460004000],
            [2.812425000, 3.266553000, 8.131637000],
            [2.886404000, 5.392925000, 9.848966000]]
>>> my_app = SurfaceArea()
>>> my_app.add_metal(metal)
>>> my_app.add_octa(coord)
```

```python
start_app()
Start application.
```

```python
add_number(number)
Add file number to box.

Parameters

- **number**(int) – File number.
```

```python
add_metal(metal)
Add metal atom to box:

Parameters

- **metal**(str) – Metal atom.
```

```python
add_octa(coord)
Add atomic coordinates of octahedron and find triangle area of the faces.

Parameters

- **coord**(array_like) – Atomic coordinates of octahedral structure.
```

See also:

```python
octadist.src.util.find_faces_octa()
```

## 4.9.15 octadist.tools

**class** octadist.src.tools.CalcJahnTeller(atom, coord, cutoff_global=2.0, cutoff_hydrogen=1.2, master=None, icon=None)

**Bases:** object

Calculate angular Jahn-Teller distortion parameter.

**Parameters**

- **atom**(array_like) – Atomic labels of full complex.
- **coord**(array_like) – Atomic coordinates of full complex.
- **master**(None, object) – If None, use tk.Tk(). If not None, use tk.Toplevel(master).
- **cutoff_global**(int or float) – Global cutoff for screening bonds. Default value is 2.0.
- **cutoff_hydrogen**(int or float) – Cutoff for screening hydrogen bonds. Default value is 1.2.
• **icon** (*str*, *optional*) – If None, use tkinter default icon. If not None, use user-defined icon.

### Examples

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
           [1.885657000, 4.804777000, 6.183726000],
           [1.747515000, 6.960963000, 7.932784000],
           [4.094380000, 5.807257000, 7.588689000],
           [0.539005000, 4.482809000, 8.460004000],
           [2.812425000, 3.266553000, 8.131637000],
           [2.886404000, 5.392925000, 9.848966000]]

>>> test = CalcJahnTeller(atom=atom, coord=coord)
>>> test.start_app()
>>> test.find_bond()
>>> test.show_app()
```

### References

- **start_app()**
  Start application.

- **find_bond()**
  Find bonds.

  See also:

  - *octadist.src.util.find_bonds()* Find atomic bonds.

- **pick_atom** (*group*)
  On-mouse pick atom and get XYZ coordinate.

  Parameters group (*str*) – Group A or B.

- **plot_fit_plane()**
  Display complex and two fit planes of two sets of ligand in molecule.

- **clear_text**
  Clear text in box A & B.

- **show_app**
  Show application.

#### class **octadist.src.tools.CalcRMSD**

Calculate root mean squared displacement of atoms in complex, RMSD.

Parameters

- **coord_1** (*array_like*) – Atomic coordinates of structure 1.
- **coord_2** (*array_like*) – Atomic coordinates of structure 2.
- **atom_1** (*list, tuple, optional*) – Atomic symbols of structure 1.
atom_2 (list, tuple, optional) – Atomic symbols of structure 2. If no atom_2 specified, assign it with None.

Returns

- rmsd_normal (float) – Normal RMSD.
- rmsd_translate (float) – Translate RMSD (re-centered).
- rmsd_rotate (float) – Kabsch RMSD (rotated).

Examples

```python
>>> # Example of structure 1
>>> comp1 = 
[[10.1873, 5.7463, 5.615],
 [8.494, 5.9735, 4.8091],
 [9.6526, 6.4229, 7.3079],
 [10.8038, 7.5319, 5.1762],
 [9.6229, 3.9221, 6.0083],
 [12.0065, 5.5562, 6.3497],
 [10.8046, 4.9471, 3.9219]]

>>> # Example of structure 1
>>> comp2 = 
[[12.0937, 2.4505, 3.4207],
 [12.9603, 2.2952, 1.7286],
 [13.4876, 1.6182, 4.4230],
 [12.8522, 4.3174, 3.9894],
 [10.9307, 0.7697, 2.9315],
 [10.7878, 2.2987, 5.1071],
 [10.6773, 3.7960, 2.5424]]

>>> test = CalcRMSD(coord_1=comp1, coord_2=comp2)
>>> test.calc_rmsd()
... test.rmsd_normal
6.758144
... test.rmsd_translate
0.305792
... test.rmsd_rotate
0.277988

start_app()
show_coord()
    Show atomic coordinates in box.
calc_rmsd()
    Calculate normal, translated, and rotated RMSD.
calc_and_show()
    Execute calc_rmsd function to calculate RMSD and show results in box.
show_app()
    Show application.
4.9.16 octadist.util

octadist.src.util.\texttt{find\_bonds}(atom, coord, cutoff\_global=2.0, cutoff\_hydrogen=1.2)

Find all bond distance and filter the possible bonds.

- Compute distance of all bonds
- Screen bonds out based on global cutoff distance
- Screen H bonds out based on local cutoff distance

Parameters

- \texttt{atom (list)} – List of atomic labels of molecule.
- \texttt{coord (list)} – List of atomic coordinates of molecule.
- \texttt{cutoff\_global (int or float)} – Global cutoff for screening bonds. Default value is 2.0.
- \texttt{cutoff\_hydrogen (int or float)} – Cutoff for screening hydrogen bonds. Default value is 1.2.

Returns \texttt{filtered\_bond\_2 (list)} – Selected bonds in molecule after screening.

Examples

```python
>>> atom = ['Fe', 'N', 'N', 'N', 'O', 'O', 'O']
>>> coord = [[2.298354000, 5.161785000, 7.971898000],
        [1.888657000, 4.804777000, 6.183726000],
        [1.747515000, 6.960963000, 7.932784000],
        [4.094380000, 5.807257000, 7.588689000],
        [0.539005000, 4.482809000, 8.460004000],
        [2.884040000, 3.266553000, 8.131637000],
        [2.884040000, 5.392925000, 9.848966000]]
>>> pair_bond, bond_dist = find_bonds(atom, coord)
>>> pair_bond
[['Fe', 'N'],
 ['Fe', 'N'],
 ['Fe', 'N'],
 ['Fe', 'O'],
 ['Fe', 'O'],
 ['Fe', 'O']]
>>> bond_dist
[[[2.298354, 5.161785, 7.971898], [1.885657, 4.804777, 6.183726]],
 [[2.298354, 5.161785, 7.971898], [1.747515, 6.960963, 7.932784]],

```

octadist.src.util.\texttt{find\_faces\_octa}(c\_octa)

Find the eight faces of octahedral structure.

1. Choose 3 atoms out of 6 ligand atoms. The total number of combination is 20.
2. Orthogonally project metal center atom onto the face: m ——> m’
3. Calculate the shortest distance between original metal center to its projected point.
4. Sort the 20 faces in ascending order of the shortest distance.
5. Delete 12 faces that closest to metal center atom (first 12 faces).
6. The remaining 8 faces are the (reference) face of octahedral structure.
7. Find 8 opposite faces.

Reference plane Opposite plane

$$[[1 \ 2 \ 3] \ [4 \ 5 \ 6]$$

$$[1 \ 2 \ 4] \rightarrow [3 \ 5 \ 6]$$

... ...

$$[2 \ 3 \ 5] \ [1 \ 4 \ 6]$$

**Parameters**

- `c_octa (array_like)` – Atomic coordinates of octahedral structure.

**Returns**

- `a_ref_f (list)` – Atomic labels of reference face.
- `c_ref_f (ndarray)` – Atomic coordinates of reference face.
- `a_oppo_f (list)` – Atomic labels of opposite face.
- `c_oppo_f (ndarray)` – Atomic coordinates of opposite face.

**See also:**

- `octadist.src.plane.find_eq_of_plane()` Find the equation of the plane.
- `octadist.src.projection.project_atom_onto_plane()` Orthogonal projection of point onto the plane.

**Examples**

```python
>>> coord = [[14.68572 18.49228 6.66716]
          [14.86476 16.48821 7.43379]

4.10 Development

OctaDist is written entirely in Python 3 binding to Tkinter toolkit. We have been developing OctaDist with the ease of use and flexibility. In the current version, it supports both of a graphical user interface (GUI) and a command line interface (CLI) version. The first one is mainly developed for the general end-users who are not familiar with command line, while the latter is primarily developed as a package which is appropriate for those who works with CLI. Having designed as a third party package, the command-line OctaDist version is an smart assistant helping with a wide range of your problems.

4.10.1 Contribution

To give a contribution on program development, please pull request on the OctaDist Github.

```
git clone https://github.com/OctaDist/OctaDist.git
git checkout nightly-build
git pull origin nightly-build
```

4.10.2 OctaDist Testing

When you have finished editing the source code of the program, you can use setuptools for testing OctaDist such as build and install. A `setup.py` file in top-level directory provides software testing as follows:

```
pip setup.py build
pip setup.py install
pip setup.py test
```

4.10.3 Bug report

If you found a bug in OctaDist, please submit it on issues page. We appreciate all help and contribution in getting program development.

4.10.4 Code maintenance

The source code of OctaDist is maintained on Github version control system. Both master revision and nightly development build have been being tested and deployed on Travis CI, a continuous integration service.

Source code on Github:

- Master (stable) version : github.com/OctaDist/OctaDist
• Nightly build version : github.com/OctaDist/OctaDist/tree/nightly-build

Tip: For OctaDist download stats, please go to https://octadist.github.io/stats.html.

4.11 Authors

The program is actively developed in international collaboration between the members of the Computational Chemistry Research Unit at Thammasat University, the Functional Materials & Nanotechnology CoE at Walailak University, Thailand, and the Switchable Molecules and Materials group at University of Bordeaux, France.

• Rangsiman Ketkaew (Thammasat University, Thailand) E-mail: rangsiman1993@gmail.com
• Yuthana Tantirungrotechai (Thammasat University, Thailand) E-mail: yt203y@gmail.com
• David J. Harding (Walailak University, Thailand) E-mail: h david@mail.wu.ac.th
• Phimphaka Harding (Walailak University, Thailand) E-mail: kphimpha@mail.wu.ac.th
• Mathieu Marchivie (University of Bordeaux, France) E-mail: mathieu.marchivie@icmcb.cnrs.fr
