OpenEst is a library created by the Climate Impact Lab team.

This code is open source and available on [github](#).

We can add any additional information about the library here. Please make suggestions.

CHAPTER 1

Intro and Setup

This is where the introduction to our libraries will go. Ideally, this will be a short overview of the library, with one or two very simple use cases. It will, hopefully, answer the question: ‘Why should I use this tool?’

1.1 Installation

This part of the documentation covers the installation of OpenEst.

This library depends on numpy and scipy. In addition, to use Mean-Size hierarchical sampling, the emcee library must be installed.

```
pip install numpy  
pip install scipy  
pip install emcee
```

Install the package by calling `python setup.py install` (or use *develop* rather than *install* if you’ll be editing the code).

CHAPTER 2

The API Documentation / Guide

If you are looking for information on a specific function, class, or method, this part of the documentation is for you.

2.1 openest package

2.1.1 Subpackages

openest.generate

Submodules

openest.generate.calculation module

class openest.generate.calculation.**Application** (*region*)
Bases: object

done ()

push (*ds*)

Returns an interator of (yyyy, value, ...).

class openest.generate.calculation.**ApplicationByChunks** (*region*)
Bases: *openest.generate.calculation.Application*

push (*ds*)

push_saved (*ds*)

Returns an interator of (yyyy, value, ...). Removes used daily values from saved.

class openest.generate.calculation.**ApplicationByIrregular** (*region*, *func*, **args*,
***kwargs*)

Bases: *openest.generate.calculation.Application*

push (*ds*)

```
class openest.generate.calculation.ApplicationByYear(region, func, *args, **kwargs)
Bases: openest.generate.calculation.ApplicationByChunks

push_saved(ds)
    Returns an interator of (yyyy, value, ...). Removes used daily values from saved.

class openest.generate.calculation.ApplicationEach(region, func, finishfunc=<function
                                                <lambda>>, *args, **kwargs)
Bases: openest.generate.calculation.Application
Pass every set of values to the calculation for a value.

done()
push(ds)

class openest.generate.calculation.ApplicationPassCall(region, subapp, handler,
                                                       *handler_args,      **han-
                                                       dler_kw)
Bases: openest.generate.calculation.Application
Apply a non-enumerator to all elements of a function. if unshift, tack on the result to the front of a sequence of
results. Calls func with each year and value; returns the newly computed value

push(ds)
    Returns an interator of (yyyy, value, ...).

class openest.generate.calculation.Calculation(unitses)
Bases: object

apply(region, *args, **kwargs)
cleanup()
column_info()
    Returns an array of dictionaries, with ‘name’, ‘title’, and ‘description’.
static describe()
    Returns dictionary containing: - input_timerate: expected time rate of data, day, month, year, or any
        - output_timerate: expected time rate of data, day, month, year, or same
        - arguments: a list of subclasses of
            arguments.ArgumentType, describing each constructor argument
        - description: text description
format(lang, *args, **kwargs)
    Returns a dictionary of FormatElements. Only keys in the tree of dependencies will be output.

test()

class openest.generate.calculation.CustomFunctionalCalculation(subcalc,
                                                               from_units,
                                                               to_units, unshift,
                                                               *handler_args,
                                                               **handler_kw)
Bases: openest.generate.calculation.FunctionalCalculation, openest.generate.
calculation.Application
Calculation that creates a copy of itself for an application.

apply(region, *args, **kwargs)
donedonehandler(*allargs, **allkwargs)
init_apply()
push(ds)
```

```

pushhandler(ds, *allargs, **allkwargs)

class openest.generate.calculation.FunctionalCalculation(subcalc,      from_units,
                                                               to_units, unshift,   *han-
                                                               dler_args,        **han-
                                                               dler_kw)

Bases: openest.generate.calculation.Calculation

Calculation that calls a handler when it's applied.

apply(region, *args, **kwargs)
cleanup()
format(lang, *args, **kwargs)
format_handler(substr, lang, *handler_args, **handler_kw)
handler(year, result, *handler_args, **handler_kw)

```

openest.generate.curvegen module

```

class openest.generate.curvegen.ConstantCurveGenerator(indepunits,      depenunit,
                                                               curve)
Bases: openest.generate.curvegen.CurveGenerator

format_call(lang, *args)
get_curve(region, year, *args, **kw)

class openest.generate.curvegen.CurveGenerator(indepunits, depenunit)
Bases: object

format_call(lang, *args)
get_curve(region, year, *args, **kw)
    Returns an object of type Curve.

class openest.generate.curvegen.DelayedCurveGenerator(curvegen)
Bases: openest.generate.curvegen.CurveGenerator

format_call(lang, *args)
get_curve(region, year, *args, **kwargs)
get_next_curve(region, year, *args, **kwargs)

class openest.generate.curvegen.TransformCurveGenerator(transform,      description,
                                                               *curvegens)
Bases: openest.generate.curvegen.CurveGenerator

format_call(lang, *args)
get_curve(region, year, *args, **kw)

```

openest.generate.daily module

openest.generate.functions module

openest.generate.latextools module

`openest.generate.latextools.call(func, units, description=None, *args)`

Return a representation of this call. Any elements in args can be given their own FormatElements in the final dictionary.

`openest.generate.latextools.english_function(func, *args)`

`openest.generate.latextools.latex_function(func, *args)`

openest.generate.retrieve module

`openest.generate.retrieve.any_from_url(url)`

Returns a model retrieved from the argument `url`

`any_from_url` is a wrapper around `from_url()`. It returns a model chosen by `choose_model()`. Therefore, the file reader returned by `from_url()` must have one of the allowed model types as the first four characters in the document.

Parameters `url` (`str`) – URL of file to retrieve

Returns Model chosen by `choose_model()`

Return type object

`openest.generate.retrieve.choose_model(fp, source=None)`

Reads a file object and returns a model based on file header

The file is converted into a `BinModel`, `DDPModel`, or `SplineModel` depending on the first four characters of the file.

To use `choose_model`, the first four characters of the file reader object must be one of the following:

- `bin1`, in which case a `BinModel` will be returned,
- `ddp1` or `ddp2`, in which case a `DDPModel` will be returned, or
- `spp1`, in which case a `SplineModel` will be returned.

If the model type is not one of the types listed above, a `BaseException` will be raised.

Todo:

- **Change exception type - subclassing `BaseException` is not PEP compliant.** Custom exceptions should inherit from `Exception` or other built-in exceptions. This is so that `except Exception` will catch all exceptions except for `KeyboardInterrupt` and `SystemExit`, which are not errors, but user-triggered events. See [PEP-352](#).
-

Parameters

- `fp` (`file reader object`) – file reader object to be converted into a model.
- `source` (`str`) – Meta-information about url the file was recovered from

Returns Model of class `BinModel`, `DDPModel`, or `SplineModel`.

Return type object

`openest.generate.retrieve.ddp_from_url(url)`

Returns a `DDPModel` from the argument `url`

`openest.generate.retrieve.from_url(url, create_func)`

Returns a `StringIO.StringIO` buffer with the contents of the response from `url`

Todo:

- response from `urllib2.urlopen(req)` is already a buffer. Is writing to a new buffer necessary?
-

`openest.generate.retrieve.spline_from_url(url)`

Returns a `SplineModel` from the argument `url`

openest.generate.shortterm module

```
class openest.generate.shortterm.InstaZScoreApply(units, curve,
                                                curve_description, lasttime,
                                                weather_change=<function
                                                <lambda>>)
Bases: openest.generate.calculation.Calculation, openest.generate.
calculation.Application

apply(region, *args, **kwargs)
column_info()
static describe()
push(time, weather)

class openest.generate.shortterm.MonthlyClimateApply(units, curve, curve_description,
                                                       monthmeans, regions,
                                                       weather_change=<function
                                                       <lambda>>)
Bases: openest.generate.calculation.Calculation

apply(region, *args)
column_info()
static describe()

class openest.generate.shortterm.MonthlyZScoreApply(units, curve, curve_description,
                                                       monthmeans, months-
                                                       devs, regions,
                                                       weather_change=<function
                                                       <lambda>>)
Bases: openest.generate.calculation.Calculation, openest.generate.
calculation.Application

apply(region, *args, **kwargs)
column_info()
static describe()
push(time, weather)
```

```
class openest.generate.shortterm.SingleWeatherApply(units, curve, curve_description,
                                                    weather_change=<function
                                                    <lambda>>)
Bases: openest.generate.calculation.Calculation
apply(region, *args)
column_info()
static describe()

class openest.generate.shortterm.SplitByMonth(subcalc)
Bases: openest.generate.calculation.Calculation
apply(region, *args, **kwargs)
column_info()
static describe()
```

openest.generate.stdlib module

openest.generate.weathertools module

```
openest.generate.weathertools.combo_effects(effect_dicts, scale_gens)
openest.generate.weathertools.date_to_datestr(date)
openest.generate.weathertools.get_crop_calendar(cropfile)
openest.generate.weathertools.growing_seasons_daily_ncdf(yyyyddd, weather, plant-
                                                       day, harvestday)
openest.generate.weathertools.growing_seasons_mean_ncdf(yyyyddd, weather, plant-
                                                       day, harvestday)
openest.generate.weathertools.growing_seasons_mean_reader(reader, plantday, har-
                                                       vestday)
openest.generate.weathertools.read_scale_file(filepath, factor)
openest.generate.weathertools.xmap_apply_model(xmap, model, pval)
openest.generate.weathertools.yearly_daily_ncdf(yyyyddd, weather)
```

openest.lincombo package

Submodules

openest.lincombo.continuous_sampled module

```
class openest.lincombo.continuous_sampled.ContinuousSampled(func)
Bases: scipy.stats._distn_infrastructure.rv_continuous
guess_ranges(mini, maxi, count=10000)
guess_ranges_gridded(mini, maxi, count=10000)
pdf(xxs)
prepare_draws(mini, maxi, count=10000)
```

```
prepare_draws_gridded(mini, maxi, count=10000)
rvs(size=1, random_state=None)
```

openest.lincombo.helpers module

Helper functions

```
openest.lincombo.helpers.check_arguments(betas, stderrs, portions)
Ensure that the parameters have the right dimensions for calculation.
```

```
openest.lincombo.helpers.issparse(portions)
Check if an array is sparse.
```

openest.lincombo.hiernorm module

```
openest.lincombo.hiernorm.alpha_given_taus(betas, stdvars, portions, obstaus)
openest.lincombo.hiernorm.betahat_given_taus(betas, stdvars, portions, obstaus)
openest.lincombo.hiernorm.get_sampled_column(allvals, col)
openest.lincombo.hiernorm.lincombo_hiernorm_taubyalpha(betas,      stderrs,      por-
                                         tions,      maxtau=None,
                                         guess_range=False,
                                         draws=100)
openest.lincombo.hiernorm.lincombo_hiernorm_taubybeta(betas,      stderrs,      por-
                                         tions,      maxtaus=None,
                                         guess_range=False,
                                         draws=100)
openest.lincombo.hiernorm.probability_tau(alphas, taus, obstaus, betas, stdvars, portions,
                                         probability_prior_taus)
openest.lincombo.hiernorm.sample_posterior(betas, stderrs, portions, taudist, taus2obstaus,
                                         draws=100)
```

openest.lincombo.hierregress module

```
openest.lincombo.hierregress.betahat_given_tau(yy, stdvars, XX, tau)
openest.lincombo.hierregress.get_sampled_column(allvals, col)
openest.lincombo.hierregress.lincombo_hierregress(yy, stderrs, XX, maxtau=None,
                                         guess_range=False, draws=100)
openest.lincombo.hierregress.lincombo_hierregress_taubybta(yy, stderrs, XX,
                                         maxtau=None,
                                         guess_range=False,
                                         draws=100)
openest.lincombo.hierregress.lincombo_hierregress_taubymu(yy, stderrs, XX,
                                         maxtau=None,
                                         guess_range=False,
                                         draws=100)
openest.lincombo.hierregress.mu_given_tau(yy, stdvars, XX, tau)
```

```
openest.lincombo.hierregress.probability_tau(mus, tau, yy, stdvars, XX, probability_prior_tau)
openest.lincombo.hierregress.sample_posterior(yy, stdeerrs, XX, taudist, draws=100)
```

openest.lincombo.montecarlo module

```
openest.lincombo.montecarlo.regress_distribution(means, serrs, XX, count=1000)
openest.lincombo.montecarlo.regress_draws(means, serrs, XX, count=1000)
openest.lincombo.montecarlo.regress_summary(means, serrs, XX, count=1000)
```

openest.lincombo.multi_delta module

```
class openest.lincombo.multi_delta.MultivariateDelta(vals)
    Bases: scipy.stats._multivariate.multi_rv_frozen

    pdf(xxs)
    rvs(size=1, random_state=None)
    vals()
```

openest.lincombo.multi_draws module

```
class openest.lincombo.multi_draws.MultivariateDraws(draws)
    Bases: scipy.stats._multivariate.multi_rv_frozen

    mean()
    rvs(size=1, random_state=None)
    std()
```

openest.lincombo.multi_normal module

```
class openest.lincombo.multi_normal.MultivariateNormal(means, big_sigma)
    Bases: scipy.stats._multivariate.multi_rv_frozen

    logpdf(xxs)
    pdf(xxs)
    rvs(size=1)
```

openest.lincombo.multi_sampled module

```
class openest.lincombo.multi_sampled.MultivariateSampled(func, dims)
    Bases: scipy.stats._multivariate.multi_rv_frozen

    guess_ranges(mins, maxs, count=10000)
    guess_ranges_gridded(mins, maxs, count=10000)
    pdf(xxs)
```

```
prepare_draws(mins, maxs, count=10000)
prepare_draws_gridded(mins, maxs, lens)
rvs(size=1, random_state=None)
```

openest.lincombo.multi_uniform module

```
class openest.lincombo.multi_uniform.MultivariateUniform(mins, maxs)
    Bases: scipy.stats._multivariate.multi_rv_frozen

    maxs()
    mins()
    pdf(xxs)
    rvs(size=1, random_state=None)
```

openest.lincombo.pooling module

Create a pooled estimates.

The main function is *lincombo_pooled*.

```
openest.lincombo.pooling.estimated_maxlintaus(betas, stderrs, portions)
    For use with hiernorm by-beta.
```

```
openest.lincombo.pooling.estimated_maxtau(betas, stderrs, portions)
    For use with hiernorm by-alpha.
```

```
openest.lincombo.pooling.lincombo_pooled(betas, stderrs, portions)
```

```
openest.lincombo.pooling.sum_multiply(sparsecol, densevec)
```

```
openest.lincombo.pooling.sum_multiply2(sparse, col1, col2, densevec)
```

openest.models package

Submodules

openest.models.bin_model module

```
class openest.models.bin_model.BinModel(xx=None, model=None)
    Bases: openest.models.univariate_model.UnivariateModel, openest.models.
            memoizable.MemoizableUnivariate
```

Bin Model

A bin model represents bins of different spans, where the distribution is constant over each bin. It is a combination of information describing the bins and an underlying categorical model of one of the other types.

The underlying model is always categorical, with categories starting at 1. 0 is reserved for a future version that allows an out-of-sample distribution

The format is:

```
bin1
<x0>, <x1>, <x2>, ...
<underlying model>
```

Parameters

- **xx** (*list-like*) – List-like array of bin edges. *len(xx)* should be one more than the number of bins.
- **model** (*object*) – Statistical model used in each bin

cdf (*x, y*)

static combine (*one, two*)
Both models are BinModels

static consistent_bins (*models*)
All models are BinModels

copy ()
copy data and return BinModel with the same data

draw_sample (*x=None*)

eval_pval (*x, p, threshold=0.001*)

eval_pval_index (*ii, p, threshold=0.001*)

filter_x (*xx*)
Returns new *BinModel*

get_bin_at (*x*)
Returns bin containing value *x*

Parameters **x** (*numeric*) – Value to search for in binned axis

Returns Returns index of bin containing *x*. If bin is not contained in the bin range, returns *-1*.

Return type int

get_edges ()
Returns bin edges (duplicate of *get_xx()*)

get_mean (*x=None, index=None*)

get_sdev (*x=None, index=None*)

get_xx ()
returns x axis index

get_xx_centers ()
returns x axis index

init_from_bin_file (*file, delimiter, status_callback=None, init_submodel=<function <lambda>>*)

interpolate_x (*newxx*)
Returns a copy of the model. *Does not interpolate.*

kind ()
returns model type (“bin_model”)

static merge (*models*)
All models are BinModels

scale_p(*a*)
Scales p-values of underlying bin models (in log_p format)
Interface to *self.model.scale_p*.

scale_y(*a*)
Scales y-axes of underlying bin models
Interface to *self.model.scale_y(a)*

to_ddp(*ys=None*)

to_points_at(*x, ys*)

write(*file, delimiter*)
Write model as delimited document to file-like object
Prepends model type (bin1) and bin borders (xx) to document written by *self.model.write*.

Parameters

- **file** (*object*) – file-like object
- **delimiter** (*str*) – Delimiter to use in file (e.g. ‘ ‘, ‘,’)

write_file(*filename, delimiter*)
Write model as delimited document to filepath
Wrapper around *write()* method.

Parameters

- **filename** (*str*) – Path to file to be written
- **delimiter** (*str*) – Delimiter to use in file (e.g. ‘ ‘, ‘,’)

openest.models.curve module

class openest.models.curve.ClippedCurve(*curve, cliplow=True*)
Bases: *openest.models.curve.UnivariateCurve*

class openest.models.curve.CoefficientsCurve(*coeffs, curve, xtrans*)
Bases: *openest.models.curve.UnivariateCurve*
A curve represented by the sum of multiple predictors, each multiplied by a coefficient.

class openest.models.curve.CubicSplineCurve(*knots, coeffs*)
Bases: *openest.models.curve.UnivariateCurve*

get_terms(*x*)
Get the set of knots-1 terms representing temperature x.

class openest.models.curve.CurveCurve(*xx, curve*)
Bases: *openest.models.curve.UnivariateCurve*

static make_linear_spline_curve(*xx, yy, limits*)

class openest.models.curve.FlatCurve(*yy*)
Bases: *openest.models.curve.CurveCurve*

class openest.models.curve.LinearCurve(*yy*)
Bases: *openest.models.curve.CurveCurve*

class openest.models.curve.MinimumCurve(*curve1, curve2*)
Bases: *openest.models.curve.UnivariateCurve*

```
class openest.models.curve.OtherClippedCurve (clipping_curve, value_curve)
    Bases: openest.models.curve.ClippedCurve

class openest.models.curve.PiecewiseCurve (curves, knots, xtrans=<function <lambda>>)
    Bases: openest.models.curve.UnivariateCurve

class openest.models.curve.ProductCurve (curve1, curve2)

```

Discrete-Discrete-Probability (DDP) Format

A DDP file describes a dose-response relationship with a limited collection of response outcomes. The dose and response values may be either categorical or sampled at a collection of numerical levels.

<y-value-1>, ..., <y-value-N> and <x-value-1>, ..., <x-value-N> are either strings (for named categories) or numerical values.

The format of a DDP file is:

```
<format>, <y-value-1>, <y-value-2>, ...
<x-value-1>, p(y1|x1), p(y2|x1), ...
<x-value-2>, p(y1|x2), p(y2|x2), ...
```

Below is a sample categorical DDP file:

```
ddp1, live, dead
control,.5,.5
treated,.9,.1
```

Below is a sample numerical DDP file:

```
ddp1,-10.0,-.33333333333,3.33333333333,10.0
0.0,0.5,0.5,0.0,0.0
13.3333333333,0.0,0.5,0.5,0.0
26.6666666667,0.0,0.0,0.5,0.5
40.0,0.0,0.0,0.0,0.5
```

Parameters

- **p_format** (*str*) – Probability format. May be one of the following values:
 - ddp1 - the p(.) values are simple probabilities ($0 < p(.) < 1$ and $\sum p(y|x) = 1$)
 - ddp2 - the p(.) values are log probabilities
- **source** (*str*) – Metadata attribute. Name of file this object was read in from.
- **xx_is_categorical** (*bool*) – Indicates whether xx is categorical. False indicates numeric data.
- **xx** (*list-like*) – X axis index
- **yy_is_categorical** (*bool*) – Indicates whether yy is categorical. False indicates numeric data.
- **yy** (*list-like*) – Y axis index
- **pp** (*array-like*) – underlying numpy(?) data array
- **unaccounted** (*numpy.array*) – column of remaining probability. *unaccounted* = $1 - \sum(pp, axis=1)$.
- **scaled** (*bool*) – Indicates whether data has been scaled. If scaled, re-scale so pp. *sum(axis=1)*==1.

add_to_y (*a*)
add value a to each element of index y (numeric only)

static combine (*one, two*)

copy ()
copy data and return DDPMModel with the same data

static create_lin (*yy, xxs*)
Create a DDP model by supplying y index and dictionary of p-values

Parameters

- **yy** (*list-like*) – y-index labels
- **xxs** (*dict*) – dictionary keyed with x-index values with p-values for vals

draw_sample (*x=None*)

Randomly sample label from y-index using p values in row x

If x is None (default), use first row. Uses self.get_closest(x) to find matching nearest match for x-index label x

eval_pval (*x, p, threshold=0.001*)

eval_pval_index (*ii, p, threshold=0.001*)

filter_x (*xx*)

Slice DDPMModel data such that the values of the x index == xx

```
static from_file(filename, delimiter)
    read DDP file from file path

get_closest(x=None)
    return closest index on x axis

    If x index is categorical, coerce x to string and find first matching index. If numeric, find the closest value.

    If x is None (default), return 0

get_mean(x=None)
    Returns the mean of the y-index labels weighted by p values in row x

    If x is None (default), use first row. Uses self.get_closest(x) to find matching nearest match for x-index
    label x

get_sdev(x=None)
    Returns the std dev of the y-index labels weighted by p values in row x

    If x is None (default), use first row. Uses self.get_closest(x) to find matching nearest match for x-index
    label x

get_xx()
    returns x axis index

get_yy()
    returns x axis index

init_from(file, delimiter, status_callback=None, source=None)
    Read DDP data set from file

init_from_other(ddp)
    copy attributes of other DDP dataset to this one

interpolate_x(newxx, kind='quadratic')
    custom interpolation method. wrapper around scipy.interp1d.
```

Parameters

- **newxx** (*list-like*) – new x axis
- **kind** (*str*) – interpolation method, passed to scipy.interp1d

```
interpolate_y(newyy, kind='quadratic')
    custom interpolation method. wrapper around scipy.interp1d.
```

Parameters

- **newyy** (*list-like*) – new y axis
- **kind** (*str*) – interpolation method, passed to scipy.interp1d

```
kind()
    returns model type ("ddp_model")
```

```
lin_p()
    convert any DDPMModel to ddp1 (linear probability) format
```

```
log_p()
    convert any DDPMModel to ddp2 (log probability) format
```

```
static merge(models)
```

```
recategorize_x(oldxx, newxx)
```

```
rescale (as_ddp=True)
    Can rescale non-ddp (that is, as sampling of continuous distribution)

scale_p (a)
    coerce to ddp2 (log probability) format and scale by a

scale_y (a)
    multiply index y (numeric only) by scale factor a

to_ddp (ys=None)
    coerce to DDP, interpolating along y axis if necessary

transpose ()
    transpose data structure

write (file, delimiter)
    write CSV to file object

write_file (filename, delimiter)
    write CSV to file path
```

openest.models.delta_model module

```
class openest.models.delta_model.DeltaModel (xx_is_categorical=False, xx=None, locations=None, scale=1)

                                                               xx_is_categorical=False,
                                                               xx=None,
                                                               yy_is_categorical=False,
                                                               yy=None, pp=None,
                                                               unaccounted=None,
                                                               scaled=True)

Bases: openest.models.ddp_model.DDPModel

apply_as_distribution(model)
```

openest.models.features_interpreter module

Probability Features File

The probability features file has the following format:

```
dpc1,<p-header-1>,<p-header-2>,...  
<x-value-1>,g_1(y | x_1),g_2(y | x_1),...  
<x-value-2>,g_1(y | x_2),g_2(y | x_2),...  
...
```

<p-header> headers can be any of the following, with the corresponding values in their rows (<p-value-i j>).

- mean: $E y|x_i$
- var: $E(y|x_i - E y|x_i)^2$
- sdev: $\sqrt{E(y|x_i - E y|x_i)^2}$
- skew: $E((y|x_i - E y|x_i) / \sqrt{E(y|x_i - E y|x_i)^2})^3$
- mode: $\max f(y | x_i)$
- numeric (0 - 1): $F^{-1}(p_j|x_i)$

The row headers (<x-value>) can be numeric, in which case a continuous spline bridges them, or categorical strings.

Below is a sample features file:

```
dpc1,mean,var  
treated,0,1  
control,4,4
```

```
class openest.models.features_interpreter.FeaturesInterpreter

    static best_knot(knots, newknots)
        Find the knot furthest from existing knots

    static best_spline(header, row, limits)

scale_y(a)
write(file, delimiter)
write_file(filename, delimiter)

```

openest.models.mean_size_model module

Mean-Size Model

In Mean-Size models, each point is characterized only by a value and the population size that went into estimating that value. As such, it does not have enough information to generate a full distribution. It can be safely combined with other mean-size models, or approximated with a Gaussian (with a variance which is equal to the absolute value of the mean for size = 1, and a variance that decreases with the square root of the size, according to the Central Limit Theorem).

The format is:

```
msx1,mean,size  
<x0>,<mean0>,<size0>  
<x1>,<mean1>,<size1>  
...
```

```
class openest.models.mean_size_model.MeanSizeModel(xx_is_categorical=False,  
                                                xx=None,               means=None,

draw_sample(x=None)
```

Produce a sample value of y from the conditional distribution.

```
eval_pval(x, p, threshold=0.001)
```

Inverse CDF Evaluation

Returns the value of y that corresponds to a given p-value: $F^{-1}(p | x)$.

```
get_attribute(title)
```

```
get_mean (x=None)
E[Y | X]

get_sdev (x=None)
sqrt Var[Y | X]

kind()

static merge (models)
Pooling Merging

Each form provides methods for producing a pooled parameter estimate from multiple parameter estimates.
These could all be parameter estimates with the same form, or with two different forms: $p_1(y | x) p_2(y | x)$.

mergers = {'delta_model': <function merge>, 'mean_size_model': <function merge>, 'de

scale_p (a)
Raise the distribution to the power 'a' and rescales.

    Returns modifies this model and returns it

    Return type self

scale_y (a)
Rescaling of the Parameter Dimension

    Produces a new conditional PDF with the $y$ dimension scaled by a constant: $p(z | x) = p(rac{y}{a} | x)$.

to_points_at (x, ys)
Conditional Probability Density Evaluation

    Returns unscaled probability density values for given values of $x$ and $y$: $f(y | x)$.
```

openest.models.multivariate_model module

```

Model Spline File

Each line in a model spline file represents a polynomial segment in log-probability space. The format is as follows:

```

spp1
<x>, <y0>, <y1>, <a0>, <a1>, <a2>
...

```

Each line describes a segment of a probability distribution of y, conditional on x = <x>. The segment spans from <y0> to <y1>, where the lowest value of <y0> may be $-\infty$, and the highest value of <y1> may be ∞ . The <x> values may also be categorical or numerical. If they are numerical, it is assumed that these values represent samples of a smoothly varying function (a cubic spline in every y).

The values <a0>, <a1> and <a2> are the polynomial coefficients in y (with quadratic coefficients, only normal or exponential tails are possible). The final segment of the probability function is:

```

exp(a0 + a1 y + a2 y2)

```

Parameters

- **xx_is_categorical**(bool) –
- **xx**(list-like) –
- **conditionals** –
- **scaled**(bool) –

add_conditional(x, conditional)

```
openest.swapbin.transform.swap_beta(beta, T)
openest.swapbin.transform.swap_vcv(V, T)
openest.swapbin.transform.transform(predcount, bins, dropbin, totals)
```

Construct a transform matrix from an old set of predictors to a bin swapped set.

The intercept is assumed to be the first predictor.

Parameters

- **predcount** (*int*) – the number predictors, including the intercept.
- **bins** (*list[int]*) – the indices of the bins amongst the predictors.
- **dropbin** (*int*) – an index into *bins*
- **totals** (*float*) – the value that all bin values would sum to, e.g. 1 if the bins are indicators e.g., 365 if the bins are daily over a year

CHAPTER 3

The Developers Guide

If you want to contribute to the project, this part of the documentation is for you.

3.1 Contributor's Guide

This document lays out guidelines and advice for contributing to this project. If you're thinking of contributing, please start by reading this document and getting a feel for how contributing to this project works. If you have any questions, feel free to reach out to either [James Rising](#), [Mike Delgado](#), or [Justin Simcock](#).

When contributing code, you'll want to follow this checklist:

1. Fork the repository on GitHub.
2. Run the tests to confirm they all pass on your system. If they don't, you'll need to investigate why they fail. If you're unable to diagnose this yourself, raise it as a bug report by following the guidelines in this document: [Bug Reports](#).
3. Write tests that demonstrate your bug or feature. Ensure that they fail.
4. Make your change.
5. Run the entire test suite again, confirming that all tests pass *including the ones you just added*.
6. Send a GitHub Pull Request to the main repository's `master` branch. GitHub Pull Requests are the expected method of code collaboration on this project.

3.1.1 Documentation Links

The documentation files live in the `openest_docs/` directory of the codebase. They're written in `reStructuredText`, and use `Sphinx` to generate the full suite of documentation.

When writing documentation, please do your best to follow the style of the documentation files.

Here is an reference example Python Module with `reStructuredText` in the docstring.

```
"""Example NumPy style docstrings.
```

This module demonstrates documentation as specified by the `NumPy Documentation HOWTO`_. Docstrings may extend over multiple lines. Sections are created with a section header followed by an underline of equal length.

Example

Examples can be given using either the ``Example`` or ``Examples`` sections. Sections support any reStructuredText formatting, including literal blocks::

```
$ python example_numpy.py
```

Section breaks are created with two blank lines. Section breaks are also implicitly created anytime a new section starts. Section bodies *may* be indented:

Notes

This is an example of an indented section. It's like any other section, but the body is indented to help it stand out from surrounding text.

If a section is indented, then a section break is created by resuming unindented text.

Attributes

```
module_level_variable1 : int
```

Module level variables may be documented in either the ``Attributes`` section of the module docstring, or in an inline docstring immediately following the variable.

Either form is acceptable, but the two should not be mixed. Choose one convention to document module level variables and be consistent with it.

```
.. _NumPy Documentation HOWTO:
```

```
https://github.com/numpy/numpy/blob/master/doc/HOWTO\_DOCUMENT.rst.txt
```

"""

```
module_level_variable1 = 12345
```

```
module_level_variable2 = 98765
```

```
"""int: Module level variable documented inline.
```

The docstring may span multiple lines. The type may optionally be specified on the first line, separated by a colon.

"""

```
def function_with_types_in_docstring(param1, param2):
```

```
    """Example function with types documented in the docstring.
```

```
`PEP 484`_ type annotations are supported. If attribute, parameter, and
```

return types are annotated according to `PEP 484`_, they do not need to be included in the docstring:

```
Parameters
-----
param1 : int
    The first parameter.
param2 : str
    The second parameter.

Returns
-----
bool
    True if successful, False otherwise.

.. _PEP 484:
    https://www.python.org/dev/peps/pep-0484/

"""

```

```
def function_with_pep484_type_annotations(param1: int, param2: str) -> bool:
    """Example function with PEP 484 type annotations.
```

The return type must be duplicated in the docstring to comply with the NumPy docstring style.

```
Parameters
-----
param1
    The first parameter.
param2
    The second parameter.

Returns
-----
bool
    True if successful, False otherwise.

"""

```

```
def module_level_function(param1, param2=None, *args, **kwargs):
    """This is an example of a module level function.
```

Function parameters should be documented in the ``Parameters`` section. The name of each parameter is required. The type and description of each parameter is optional, but should be included if not obvious.

*If `*args` or `**kwargs` are accepted, they should be listed as ```*args``` and ```**kwargs```.*

The format for a parameter is::

```
    name : type
        description
```

The description may span multiple lines. Following lines

```
should be indented to match the first line of the description.
The ": type" is optional.

Multiple paragraphs are supported in parameter
descriptions.

Parameters
-----
param1 : int
    The first parameter.
param2 : :obj:`str`, optional
    The second parameter.
*args
    Variable length argument list.
**kwargs
    Arbitrary keyword arguments.

Returns
-----
bool
    True if successful, False otherwise.

The return type is not optional. The ``Returns`` section may span
multiple lines and paragraphs. Following lines should be indented to
match the first line of the description.

The ``Returns`` section supports any reStructuredText formatting,
including literal blocks::

{
    'param1': param1,
    'param2': param2
}

Raises
-----
AttributeError
    The ``Raises`` section is a list of all exceptions
    that are relevant to the interface.
ValueError
    If `param2` is equal to `param1`.

"""
if param1 == param2:
    raise ValueError('param1 may not be equal to param2')
return True

def example_generator(n):
    """Generators have a ``Yields`` section instead of a ``Returns`` section.

Parameters
-----
n : int
    The upper limit of the range to generate, from 0 to `n` - 1.

Yields
-----
```

```

int
    The next number in the range of 0 to `n` - 1.

Examples
-----
Examples should be written in doctest format, and should illustrate how
to use the function.

>>> print([i for i in example_generator(4)])
[0, 1, 2, 3]

"""

for i in range(n):
    yield i

class ExampleError(Exception):
    """Exceptions are documented in the same way as classes.

    The __init__ method may be documented in either the class level
    docstring, or as a docstring on the __init__ method itself.

    Either form is acceptable, but the two should not be mixed. Choose one
    convention to document the __init__ method and be consistent with it.

Note
-----
Do not include the `self` parameter in the ``Parameters`` section.

Parameters
-----
msg : str
    Human readable string describing the exception.
code : :obj:`int`, optional
    Numeric error code.

Attributes
-----
msg : str
    Human readable string describing the exception.
code : int
    Numeric error code.

"""

    If the class has public attributes, they may be documented here
    in an ``Attributes`` section and follow the same formatting as a
    function's ``Args`` section. Alternatively, attributes may be documented
    inline with the attribute's declaration (see __init__ method below).

```

Properties created with the ``@property`` decorator should be documented in the property's getter method.

Attributes

```
attr1 : str
    Description of `attr1`.
attr2 : :obj:`int`, optional
    Description of `attr2`.
```

"""

```
def __init__(self, param1, param2, param3):
    """Example of docstring on the __init__ method.
```

The `__init__` method may be documented in either the class level docstring, or as a docstring on the `__init__` method itself.

Either form is acceptable, but the two should not be mixed. Choose one convention to document the `__init__` method and be consistent with it.

Note

Do not include the `'self'` parameter in the ``Parameters`` section.

Parameters

```
param1 : str
    Description of `param1`.
param2 : :obj:`list` of :obj:`str`
    Description of `param2`. Multiple
    lines are supported.
param3 : :obj:`int`, optional
    Description of `param3`.
```

3.1.2 Bug Reports

Bug reports are hugely important! Before you raise one, though, please check through the [GitHub issues](#), **both open and closed**, to confirm that the bug hasn't been reported before. Duplicate bug reports are a huge drain on the time of other contributors, and should be avoided as much as possible.
