puppet-php is a module for managing PHP using puppet.

# CHAPTER 1

---

## Why Use puppet-php

---

- it's very fast to install, a few minutes tops.
- it supports all PHP SAPIs out of the box.
- it supports a lot of PHP extensions out of the box.
- it's is very flexible and has tons of configuration options, and sane defaults.
- it aims to stay out of your way, and if it happens to get in your way, you can change the undesired behavior very easily.
- it removes the boilerplate code from your manifests, which mean less code to maintain, and less code to spend time unit testing.
- it uses the MIT license.

## CHAPTER 2

---

Source code

---

The source can be found at [github.com/jippi/puppet-php](https://github.com/jippi/puppet-php)

## CHAPTER 3

---

### License

---

The project is released under the permissive MIT license.

## CHAPTER 4

---

### Bugs

---

If you happen to stumble upon a bug, please feel free to create a pull request with a fix (optionally with a test), and a description of the bug and how it was resolved.

You can also create an issue with a description to raise awareness of the bug.

## CHAPTER 5

---

### Features

---

If you have a good idea for a feature, please join us on IRC and let's discuss it. Pull requests are always more than welcome.

## CHAPTER 6

---

### Support / Questions

---

You can find me on IRC in the #puppet channel on [irc.freenode.net](http://irc.freenode.net) for any support or questions. My alias is Jippi
