Core engine for tierra_qa package

This Pytest plugin was generated with Cookiecutter along with @hackebrot's Cookiecutter-pytest-plugin template.

CHAPTER 1

Features

`pytest-pypom-navigation` is not intended to be used as a standalone package.

It provides the core engine (pytest fixtures) needed by the strong opinionated scaffolding solution called `cookiecutter-qa` that let you generate a fully working QA testing hello world project based on Selenium/Splinter with just one command.

It is also used by the `pytest-play` engine for collecting variables for tests parametrization.

CHAPTER 2

Tests

You can run “pytest-pypom-navigation” tests via tox:

```
$ pip install tox
$ tox -epy36
```

CHAPTER 3

Contributing

Contributions are very welcome. Tests can be run with `tox`, please ensure the coverage at least stays the same before you submit a pull request.

CHAPTER 4

License

Distributed under the terms of the [Apache Software License 2.0](#) license, “pytest-pypom-navigation” is free and open source software

If you encounter any problems, please [file an issue](#) along with a detailed description.

5.1 Welcome to pytest-pypom-navigation's documentation!

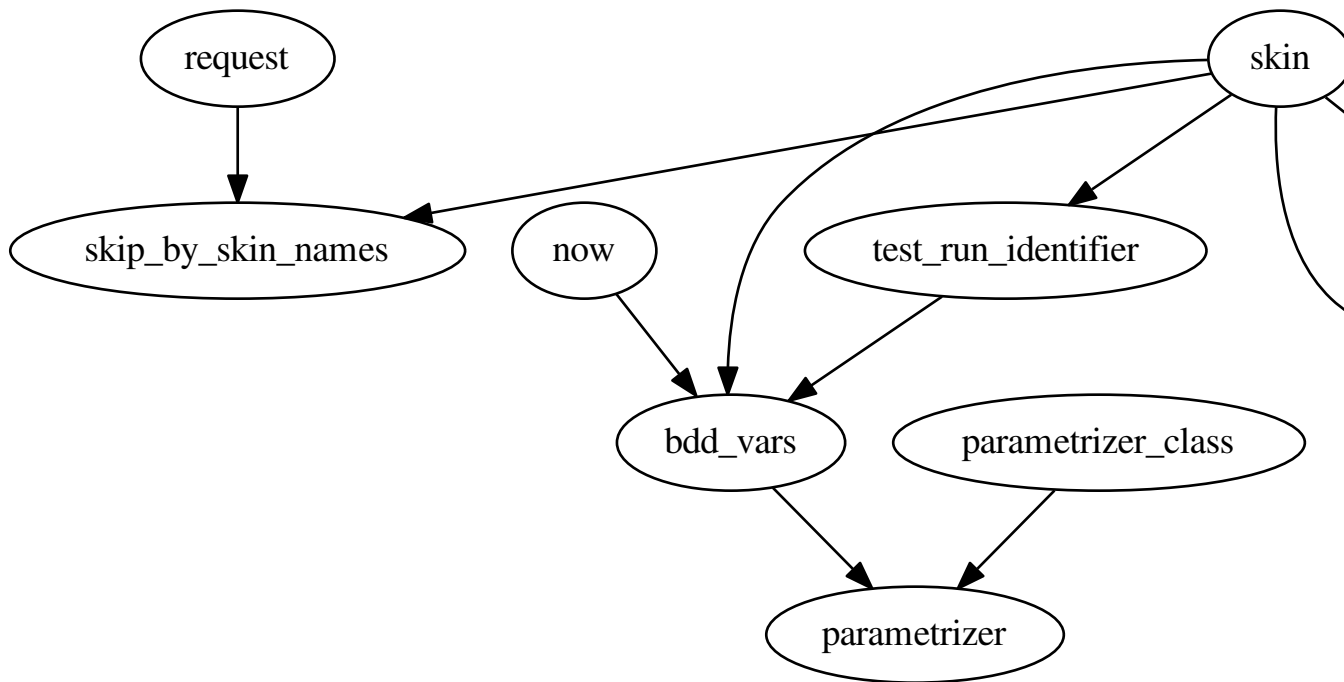

Contents:

5.1.1 API

Here you can see the technical documentation.

Fixtures

The following diagram shows the interactions between the [pytest fixtures](#) created in the `pypom_navigation` package:

`pypom_navigation.plugin.skip_skins` (*skins*)
 Decorator to mark tests to be skipped for the given skin ids.

ie. `@skip_skins(['skin1', 'skin2'])` :return `pytest.mark`:

`pypom_navigation.plugin.skin` ()
 This fixture provides the skin associated with the application on which starts the test session.

For example:

```

@pytest.fixture(scope='session', params=mypackage.DEFAULT_PAGES.keys())
def skin(request): return request.param
  
```

`pypom_navigation.plugin.default_pages` ()
 A mapping with the default page object class for each skin

It's up to you override this fixture with your settings.

For example:

```
DEFAULT_PAGES = {
    'skin1': 'mypackage.pages.BasePage',
}
```

`pypom_navigation.plugin.page_mappings()`

Returns the page mappings that describes for each page id info like the page path, the page object class to be used or any other information:

```
PAGE_MAPPINGS = {
    'HomePage': {'path': '/'},
    'LoginPage': {'path': '/'},
}
```

It's up to you override this fixture with your settings.

Returns dictionary with all known pages

Return type dict

`pypom_navigation.plugin.skin_base_url(skin, variables)`

Returns the `skin_base_url` associated to the skin.

`pypom_navigation.plugin.credentials_mapping(skin, variables)`

This fixture provides users credentials via a file specified on the `-variables` option. The file format is one supported by `pytest-variables`.

Returns credentials mapping dictionary with all available credentials

Return type dict

`pypom_navigation.plugin.default_page_class(skin, page_mappings, default_pages)`

Returns the default page object base class.

Returns base page object class

Return type `tierra_qa.pages.BasePage`

`pypom_navigation.plugin.default_timeout(variables)`

Default page timeout

`pypom_navigation.plugin.navigation(navigation_class, default_page_class, page_mappings, credentials_mapping, skin, skin_base_url, request, variables, default_timeout)`

Wraps a page and a page mappings accessible by pages.

`navigation.page` is meant to be mutable since through the BDD steps the page instance could change.

`pypom_navigation.plugin.navigation_class()`

Returns the navigation class used for wrap pages

`pypom_navigation.plugin.skip_by_skin_names(request, skin)`

Skip by skin name.

We support validation for multi skin applications providing the best page object class match.

We expect many failures we want to avoid because many tests will fail because the related page object implementation still not exists.

If you want you can omit a test execution for a given skin adding a `@pytest.mark.skip_skins(['skin2'])` decorator on your tests.

Tests marked with a `skin2 skip` will be executed for all skins except for `skin2`.

See <http://bit.ly/2dYnOSv> for further info.

`pypom_navigation.plugin.test_run_identifier` (*skin*)

Return a session based random prefixed UUID used for identifying data created in this test run.

`pypom_navigation.plugin.now` ()

Now fixture, returns current datetime object

`pypom_navigation.plugin.bdd_vars` (*test_run_identifier, skin, now*)

BDD step vars for test parametrization for dynamic values such as `test_run_identifier` or `datetime`

`pypom_navigation.plugin.parametrizer_class` ()

Provides a parametrizer class used for convert parametrized json values to regular python dicts.

`pypom_navigation.plugin.parametrizer` (*parametrizer_class, bdd_vars*)

Parametrizer object

Navigation and base page

class `pypom_navigation.pages.base.BasePage` (*driver, base_url=None, timeout=10, **url_kwargs*)

Base page

current_url

Returns the current url

Returns `current_url` of the driver instance

Return type `str`

wait_for_url_change (*url*)

Wait for url change occurred.

Returns `BasePage` instance

Return type `object`

has_text (*text*)

Check for text in page.

Returns `True` if the given text is present

Return type `bool`

Utils

`pypom_navigation.util.get_page_url` (*skin_name, page_mappings, page_id*)

Returns the `page_url` for the given `page_id` and `skin_name`

`pypom_navigation.util.get_page_class` (*skin_name, page_mappings, page_id=None, fallback=None, default_pages=None*)

Returns the page class for a given skin name and page mapping.

First of all, if there is no page id it will return the given fallback if defined or the default page for the skin in use.

If there is a page id, it will return: * the match for the given skin if defined * a fallback if defined * the given fallback if defined or the global default page class

Parametrizer

class `pypom_navigation.parametrizer.Parametrizer` (*mapping*)

This class let you parametrize your strings and convert them to regular Python dictionaries.

It supports also json.

Let's try with a **matching name**

```
>>> value = '{"baudrate": $baudrate_value}'
>>> mapping = {"baudrate_value": 250, "name": "a name"}
>>> parametrizer = Parametrizer(mapping)
```

With the `parametrize` method you'll get a parametrized string:

```
>>> parametrizer.parametrize(value)
'{"baudrate": 250}'
```

With the `json_loads` method you'll get a parametrized regular Python mapping:

```
>>> parametrizer.json_loads(value) == {'baudrate': 250}
True
```

And now with **non matching names**

```
>>> value = '{"name": "$a_name"}'
>>> mapping = {"name": "a name"}
>>> parametrizer = Parametrizer(mapping)
```

With the `parametrize` method you'll get a parametrized string:

```
>>> parametrizer.parametrize(value)
'{"name": "$a_name}"'
```

With the `json_loads` method you'll get a parametrized regular Python mapping:

```
>>> parametrizer.json_loads(value) == {'name': '$a_name'}
True
```

And **json not valid**

```
>>> value = '{"name": $name}'
>>> mapping = {"name": "a name"}
>>> parametrizer = Parametrizer(mapping)
```

With the `parametrize` method you'll get a parametrized string:

```
>>> parametrizer.parametrize(value)
'{"name": a name}'
```

Depending on Python version 2 vs 3 you will get a different exception:

- `json.decoder.JSONDecodeError: Expecting value: ...`
- `ValueError: No JSON object could be decoded`

```
>>> import pytest
>>> with pytest.raises(Exception):
...     parametrizer.json_loads(value)
```

parametrize (*value*)

Return the value with template substitution

json_loads (*value*)

Return the json load of template substitution

5.1.2 Changelog

2.0.2 (2018-04-01)

- make credentials and base url variables optional

2.0.1 (2018-01-03)

- fix `get_page_instance` (missing page kwargs before page construction)

2.0.0 (2018-01-02)

- navigation will no more be initialized automatically with an open browser by default since `pyom_navigation` is used by third party plugins even for non UI plugins. This way we avoid to open a browser if it is not needed and explicitly requested with a `set page` or `visit page`
- you can override the default page timeout using a `pytest-variables` configuration named `default_timeout`
- add new method `get_page_instance` on navigation

1.0.0 (2017-12-19)

- navigation initialized with kwargs (including variables coming from pytest variables too)
- add global timeout for all pages (default 10)
- `base_page` fixture no longer opens page by default. It's up to you visiting a page now

0.1.1 (2017-10-30)

- support fallback page classes in `action_performed`

0.1.0 (2017-10-12)

- Add `update_page` and `action_performed` methods on navigation.
- Wait for pages to load when visiting them.

0.0.1 (2017-06-13)

- First release
