Download latest version as PDF
1.1 Get Started

1.1.1 Install pytest

pytest requires: Python 3.8+ or PyPy3.

1. Run the following command in your command line:

   pip install -U pytest

2. Check that you installed the correct version:

   $ pytest --version
   pytest 8.2.2

1.1.2 Create your first test

Create a new file called test_sample.py, containing a function, and a test:

```python
# content of test_sample.py

def func(x):
    return x + 1

def test_answer():
    assert func(3) == 5
```

The test

```
$ pytest
--------------- test session starts ------------------------
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 1 item

test_sample.py F [100%]

---------------------- FAILURES --------------------
def test_answer():
```

(continues on next page)
The [100%] refers to the overall progress of running all test cases. After it finishes, pytest then shows a failure report because \( \text{func}(3) \) does not return 5.

**Note:** You can use the `assert` statement to verify test expectations. pytest’s advanced assertion introspection will intelligently report intermediate values of the assert expression so you can avoid the many names of JUnit legacy methods.

### 1.1.3 Run multiple tests

pytest will run all files of the form `test_*` or `*_test.py` in the current directory and its subdirectories. More generally, it follows standard test discovery rules.

### 1.1.4 Assert that a certain exception is raised

Use the `raises` helper to assert that some code raises an exception:

```python
# content of test_sysexit.py
import pytest

def f():
    raise SystemExit(1)

def test_mytest():
    with pytest.raises(SystemExit):
        f()
```

You can also use the context provided by `raises` to assert that an expected exception is part of a raised `ExceptionGroup`:

```python
# content of test_exceptiongroup.py
import pytest

def f():
    raise ExceptionGroup("Group message", [
        RuntimeError(),
    ],
)```
```python
def test_exception_in_group():
    with pytest.raises(ExceptionGroup) as excinfo:
        f()
    assert excinfo.group_contains(RuntimeError)
    assert not excinfo.group_contains(TypeError)
```

Execute the test function with “quiet” reporting mode:

```bash
$ pytest -q test_sysexit.py
. [100%]
1 passed in 0.12s
```

**Note:** The `-q` or `--quiet` flag keeps the output brief in this and following examples.

### 1.1.5 Group multiple tests in a class

Once you develop multiple tests, you may want to group them into a class. pytest makes it easy to create a class containing more than one test:

```
# content of test_class.py

class TestClass:
    def test_one(self):
        x = "this"
        assert "h" in x

    def test_two(self):
        x = "hello"
        assert hasattr(x, "check")
```

pytest discovers all tests following its *Conventions for Python test discovery*, so it finds both `test_` prefixed functions. There is no need to subclass anything, but make sure to prefix your class with `Test` otherwise the class will be skipped.

We can simply run the module by passing its filename:

```bash
$ pytest -q test_class.py
.F [100%]
=================================================================== TestClass.test_two
self = <test_class.TestClass object at 0xdeadbeef0001>

    def test_two(self):
        x = "hello"
>       assert hasattr(x, "check")
E       AttributeError: assert False
E       + where False = hasattr('hello', 'check')
```

```bash
test_class.py:8: AssertionError
=================================================================== short test summary info
FAILED test_class.py::TestClass::test_two - AssertionError: assert False
1 failed, 1 passed in 0.12s
```

The first test passed and the second failed. You can easily see the intermediate values in the assertion to help you understand the reason for the failure.
Grouping tests in classes can be beneficial for the following reasons:

- Test organization
- Sharing fixtures for tests only in that particular class
- Applying marks at the class level and having them implicitly apply to all tests

Something to be aware of when grouping tests inside classes is that each test has a unique instance of the class. Having each test share the same class instance would be very detrimental to test isolation and would promote poor test practices. This is outlined below:

```python
# content of test_class_demo.py
class TestClassDemoInstance:
    value = 0

    def test_one(self):
        self.value = 1
        assert self.value == 1

    def test_two(self):
        assert self.value == 1

$ pytest -k TestClassDemoInstance -q
.F 
[100%]
================================= FAILURES =================================
______________________ TestClassDemoInstance.test_two ______________________
self = <test_class_demo.TestClassDemoInstance object at 0xdeadbeef0002>
    def test_two(self):
>       assert self.value == 1
E         assert 0 == 1
E       + where 0 = <test_class_demo.TestClassDemoInstance object at 0xdeadbeef0002>
˓
>       .value

TestClassDemoInstance.py:9: AssertionError

TestClassDemoInstance.py:9: short test summary info
FAILED test_class_demo.py::TestClassDemoInstance::test_two - assert 0 == 1
1 failed, 1 passed in 0.12s
```

Note that attributes added at class level are *class attributes*, so they will be shared between tests.

### 1.1.6 Request a unique temporary directory for functional tests

`pytest` provides built-in fixtures/function arguments to request arbitrary resources, like a unique temporary directory:

```python
# content of test_tmp_path.py
def test_needsfiles(tmp_path):
    print(tmp_path)
    assert 0
```

List the name `tmp_path` in the test function signature and `pytest` will lookup and call a fixture factory to create the resource before performing the test function call. Before the test runs, `pytest` creates a unique-per-test-invocation temporary directory:
More info on temporary directory handling is available at Temporary directories and files. Find out what kind of builtin pytest fixtures exist with the command:

```
pytest --fixtures  # shows builtin and custom fixtures
```

Note that this command omits fixtures with leading _ unless the -v option is added.

1.1.7 Continue reading

Check out additional pytest resources to help you customize tests for your unique workflow:

- “How to invoke pytest” for command line invocation examples
- “How to use pytest with an existing test suite” for working with preexisting tests
- “How to mark test functions with attributes” for information on the pytest.mark mechanism
- “Fixtures reference” for providing a functional baseline to your tests
- “Writing plugins” for managing and writing plugins
- “Good Integration Practices” for virtualenv and test layouts
2.1 How to invoke pytest

See also:

*Complete pytest command-line flag reference*

In general, pytest is invoked with the command `pytest` (see below for *other ways to invoke pytest*). This will execute all tests in all files whose names follow the form `test_*`.py or `*_test`.py in the current directory and its subdirectories. More generally, pytest follows *standard test discovery rules*.

### 2.1.1 Specifying which tests to run

Pytest supports several ways to run and select tests from the command-line or from a file (see below for *reading arguments from file*).

**Run tests in a module**

```
pytest test_mod.py
```

**Run tests in a directory**

```
pytest testing/
```

**Run tests by keyword expressions**

```
pytest -k 'MyClass and not method'
```

This will run tests which contain names that match the given *string expression* (case-insensitive), which can include Python operators that use filenames, class names and function names as variables. The example above will run `TestMyClass.test_something` but not `TestMyClass.test_method_simple`. Use `''` instead of `'` in expression when running this on Windows.

**Run tests by collection arguments**

Pass the module filename relative to the working directory, followed by specifiers like the class name and function name separated by `::` characters, and parameters from parameterization enclosed in `[]`.

To run a specific test within a module:

```
pytest tests/test_mod.py::test_func
```

To run all tests in a class:
Specifying a specific test method:
```
pytest tests/test_mod.py::TestClass::test_method
```

Specifying a specific parametrization of a test:
```
pytest tests/test_mod.py::test_func[x1,y2]
```

**Run tests by marker expressions**

To run all tests which are decorated with the `@pytest.mark.slow` decorator:
```
pytest -m slow
```

To run all tests which are decorated with the annotated `@pytest.mark.slow(phase=1)` decorator, with the `phase` keyword argument set to 1:
```
pytest -m "slow(phase=1)"
```

For more information see [marks](https://docs.pytest.org/en/latest/usage.html).

**Run tests from packages**
```
pytest --pyargs pkg.testing
```

This will import `pkg.testing` and use its filesystem location to find and run tests from.

**Read arguments from file**

Added in version 8.2.

All of the above can be read from a file using the @ prefix:
```
pytest @tests_to_run.txt
```

where `tests_to_run.txt` contains an entry per line, e.g.:
```
tests/test_file.py
tests/test_mod.py::test_func[x1,y2]
tests/test_mod.py::TestClass
-m slow
```

This file can also be generated using `pytest --collect-only -q` and modified as needed.

### 2.1.2 Getting help on version, option names, environment variables

```
pytest --version  # shows where pytest was imported from
pytest --fixtures # show available builtin function arguments
pytest -h | --help  # show help on command line and config file options
```
2.1.3 Profiling test execution duration

Changed in version 6.0.

To get a list of the slowest 10 test durations over 1.0s long:

```
pytest --durations=10 --durations-min=1.0
```

By default, pytest will not show test durations that are too small (<0.005s) unless `-vv` is passed on the command-line.

2.1.4 Managing loading of plugins

Early loading plugins

You can early-load plugins (internal and external) explicitly in the command-line with the `-p` option:

```
pytest -p mypluginmodule
```

The option receives a `name` parameter, which can be:

- A full module dotted name, for example `myproject.plugins`. This dotted name must be importable.
- The entry-point name of a plugin. This is the name passed to `importlib` when the plugin is registered. For example to early-load the `pytest-cov` plugin you can use:

```
pytest -p pytest-cov
```

Disabling plugins

To disable loading specific plugins at invocation time, use the `-p` option together with the prefix `no:`.

Example: to disable loading the plugin `doctest`, which is responsible for executing doctest tests from text files, invoke pytest like this:

```
pytest -p no:doctest
```

2.1.5 Other ways of calling pytest

Calling pytest through `python -m pytest`

You can invoke testing through the Python interpreter from the command line:

```
python -m pytest [...]
```

This is almost equivalent to invoking the command line script `pytest [...]` directly, except that calling via `python` will also add the current directory to `sys.path`.

2.1. How to invoke pytest
**Calling pytest from Python code**

You can invoke `pytest` from Python code directly:

```python
retcode = pytest.main()
```

This acts as if you would call “pytest” from the command line. It will not raise `SystemExit` but return the exit code instead. If you don't pass it any arguments, `main` reads the arguments from the command line arguments of the process (`sys.argv`), which may be undesirable. You can pass in options and arguments explicitly:

```python
retcode = pytest.main(["-x", "mytestdir"])
```

You can specify additional plugins to `pytest.main`:

```python
# content of myinvoke.py
import sys
import pytest

class MyPlugin:
    def pytest_sessionfinish(self):
        print("*** test run reporting finishing")

if __name__ == "__main__":
    sys.exit(pytest.main(["-qq"], plugins=[MyPlugin()]))
```

Running it will show that `MyPlugin` was added and its hook was invoked:

```bash
$ python myinvoke.py
*** test run reporting finishing
```

**Note:** Calling `pytest.main()` will result in importing your tests and any modules that they import. Due to the caching mechanism of python's import system, making subsequent calls to `pytest.main()` from the same process will not reflect changes to those files between the calls. For this reason, making multiple calls to `pytest.main()` from the same process (in order to re-run tests, for example) is not recommended.

### 2.2 How to write and report assertions in tests

#### 2.2.1 Asserting with the `assert` statement

`pytest` allows you to use the standard Python `assert` for verifying expectations and values in Python tests. For example, you can write the following:

```python
# content of test_assert1.py
def f():
    return 3

def test_function():
    assert f() == 4
```
to assert that your function returns a certain value. If this assertion fails you will see the return value of the function call:

```bash
$ pytest test_assert1.py
==================================== test session starts ====================================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 1 item
test_assert1.py F [100%]

================================ FAILURES =================================
______________________________ test_function _______________________________

def test_function():
    assert f() == 4
E    assert 3 == 4
E    + where 3 = f()

test_assert1.py:6: AssertionError

FAILURES

--- short test summary info ---
FAILED test_assert1.py::test_function - assert 3 == 4

```

If a message is specified with the assertion like this:

```python
assert a % 2 == 0, "value was odd, should be even"
```

it is printed alongside the assertion introspection in the traceback.

See `Assertion introspection details` for more information on assertion introspection.

### 2.2.2 Assertions about expected exceptions

In order to write assertions about raised exceptions, you can use `pytest.raises()` as a context manager like this:

```python
import pytest

def test_zero_division():
    with pytest.raises(ZeroDivisionError):
        1 / 0
```

and if you need to have access to the actual exception info you may use:

```python
def test_recursion_depth():
    with pytest.raises(RuntimeError) as excinfo:
        def f():
            f()
        f()

    assert "maximum recursion" in str(excinfo.value)
```

---

### 2.2. How to write and report assertions in tests
excinfo is an ExceptionInfo instance, which is a wrapper around the actual exception raised. The main attributes of interest are .type, .value and .traceback.

Note that pytest.raises will match the exception type or any subclasses (like the standard except statement). If you want to check if a block of code is raising an exact exception type, you need to check that explicitly:

```python
def test_foo_not_implemented():
    def foo():
        raise NotImplementedError

    with pytest.raises(RuntimeError) as excinfo:
        foo()
    assert excinfo.type is RuntimeError
```

The pytest.raises() call will succeed, even though the function raises NotImplementedError, because NotImplementedError is a subclass of RuntimeError; however the following assert statement will catch the problem.

### Matching exception messages

You can pass a match keyword parameter to the context-manager to test that a regular expression matches on the string representation of an exception (similar to the TestCase.assertRaisesRegex method from unittest):

```python
import pytest

def myfunc():
    raise ValueError("Exception 123 raised")

def test_match():
    with pytest.raises(ValueError, match=r".* 123 .*"):
        myfunc()
```

Notes:

- The match parameter is matched with the re.search() function, so in the above example match='123' would have worked as well.
- The match parameter also matches against PEP-678 __notes__.

### Matching exception groups

You can also use the excinfo.group_contains() method to test for exceptions returned as part of an ExceptionGroup:

```python
def test_exception_in_group():
    with pytest.raises(ExceptionGroup) as excinfo:
        raise ExceptionGroup(  
            "Group message",
            [  
                RuntimeError("Exception 123 raised"),
            ],
        )
    assert excinfo.group_contains(RuntimeError, match=r".* 123 .*")
    assert not excinfo.group_contains(TypeError)
```
The optional `match` keyword parameter works the same way as for `pytest.raises()`.

By default `group_contains()` will recursively search for a matching exception at any level of nested `ExceptionGroup` instances. You can specify a `depth` keyword parameter if you only want to match an exception at a specific level; exceptions contained directly in the top `ExceptionGroup` would match `depth=1`.

```python
def test_exception_in_group_at_given_depth():
    with pytest.raises(ExceptionGroup) as excinfo:
        raise ExceptionGroup(
            "Group message",
            [RuntimeError(),
             ExceptionGroup(
                 "Nested group",
                 [TypeError(),
                 ]),
             ],
        )
    assert excinfo.groupContains(RuntimeError, depth=1)
    assert excinfo.groupContains(TypeError, depth=2)
    assert not excinfo.groupContains(RuntimeError, depth=2)
    assert not excinfo.groupContains(TypeError, depth=1)
```

**Alternate form (legacy)**

There is an alternate form where you pass a function that will be executed, along with `*args` and `**kwargs`, and `pytest.raises()` will execute the function with the arguments and assert that the given exception is raised:

```python
def func(x):
    if x <= 0:
        raise ValueError("x needs to be larger than zero")

pytest.raises(ValueError, func, x=-1)
```

The reporter will provide you with helpful output in case of failures such as *no exception* or *wrong exception*.

This form was the original `pytest.raises()` API, developed before the `with` statement was added to the Python language. Nowadays, this form is rarely used, with the context-manager form (using `with`) being considered more readable. Nonetheless, this form is fully supported and not deprecated in any way.

**xfail mark and pytest.raises**

It is also possible to specify a `raises` argument to `pytest.mark.xfail`, which checks that the test is failing in a more specific way than just having any exception raised:

```python
def f():
    raise IndexError()

@pytest.mark.xfail(raises=IndexError)
def test_f():
    f()
```

**2.2. How to write and report assertions in tests**
This will only “xfail” if the test fails by raising IndexError or subclasses.

- Using `pytest.mark.xfail` with the raises parameter is probably better for something like documenting unfixed bugs (where the test describes what “should” happen) or bugs in dependencies.
- Using `pytest.raises()` is likely to be better for cases where you are testing exceptions your own code is deliberately raising, which is the majority of cases.

### 2.2.3 Assertions about expected warnings

You can check that code raises a particular warning using `pytest.warns`.

### 2.2.4 Making use of context-sensitive comparisons

`pytest` has rich support for providing context-sensitive information when it encounters comparisons. For example:

```python
# content of test_assert2.py

def test_set_comparison():
    set1 = set("1308")
    set2 = set("8035")
    assert set1 == set2
```

If you run this module:

```
$ pytest test_assert2.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 1 item

test_assert2.py F [100%]

================================ FAILURES =================================
___________________________ test_set_comparison __________________________
    def test_set_comparison():
        set1 = set("1308")
        set2 = set("8035")
        assert set1 == set2

    > assert set1 == set2
    E AssertionError: assert {'0', '1', '3', '8'} == {'0', '3', '5', '8'}
    E     Extra items in the left set:
    E     '1'
    E     Extra items in the right set:
    E     '5'
    E     Use -v to get more diff

test_assert2.py:4: AssertionError

================================ short test summary info ==========================
FAILED test_assert2.py::test_set_comparison - AssertionError: assert {'0'...

Special comparisons are done for a number of cases:

- comparing long strings: a context diff is shown
- comparing long sequences: first failing indices

16 Chapter 2. How-to guides
• comparing dicts: different entries

See the *reporting demo* for many more examples.

### 2.2.5 Defining your own explanation for failed assertions

It is possible to add your own detailed explanations by implementing the `pytest_assertrepr_compare` hook.

`pytest_assertrepr_compare` *(config, op, left, right)*

Return explanation for comparisons in failing assert expressions.

- Return None for no custom explanation, otherwise return a list of strings. The strings will be joined by newlines but any newlines in a string will be escaped. Note that all but the first line will be indented slightly, the intention is for the first line to be a summary.

**Parameters**

- `config (Config)` - The pytest config object.
- `op (str)` - The operator, e.g. `"==", "!=", "not in"`.
- `left (object)` - The left operand.
- `right (object)` - The right operand.

**Use in conftest plugins**

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

As an example consider adding the following hook in a `conftest.py` file which provides an alternative explanation for `Foo` objects:

```python
# content of conftest.py
from test_foocompare import Foo

def pytest_assertrepr_compare(op, left, right):
    if isinstance(left, Foo) and isinstance(right, Foo) and op == "==":
        return [
            "Comparing Foo instances:",
            f" vals: {left.val} != {right.val}\n",
        ]
```

now, given this test module:

```python
# content of test_foocompare.py
class Foo:
    def __init__(self, val):
        self.val = val

    def __eq__(self, other):
        return self.val == other.val

def test_compare():
    f1 = Foo(1)
```

(continues on next page)
```python
f2 = Foo(2)
assert f1 == f2
```

you can run the test module and get the custom output defined in the conftest file:

```
$ pytest -q test_foocompare.py
F [100%]
================================= FAILURES =================================
_______________________________ test_compare _______________________________
def test_compare():
    f1 = Foo(1)
    f2 = Foo(2)
>   assert f1 == f2
E   assert Comparing Foo instances:
E vals: 1 != 2
```

2.2.6 Assertion introspection details

Reporting details about a failing assertion is achieved by rewriting assert statements before they are run. Rewritten assert statements put introspection information into the assertion failure message. pytest only rewrites test modules directly discovered by its test collection process, so asserts in supporting modules which are not themselves test modules will not be rewritten.

You can manually enable assertion rewriting for an imported module by calling `register_assert_rewrite` before you import it (a good place to do that is in your root `conftest.py`).

For further information, Benjamin Peterson wrote up Behind the scenes of pytest's new assertion rewriting.

Assertion rewriting caches files on disk

pytest will write back the rewritten modules to disk for caching. You can disable this behavior (for example to avoid leaving stale `.pyc` files around in projects that move files around a lot) by adding this to the top of your `conftest.py` file:

```python
import sys
sys.dont_write_bytecode = True
```

Note that you still get the benefits of assertion introspection, the only change is that the `.pyc` files won't be cached on disk.

Additionally, rewriting will silently skip caching if it cannot write new `.pyc` files, i.e. in a read-only filesystem or a zipfile.
Disabling assert rewriting

pytest rewrites test modules on import by using an import hook to write new pyc files. Most of the time this works transparently. However, if you are working with the import machinery yourself, the import hook may interfere.

If this is the case you have two options:

- Disable rewriting for a specific module by adding the string PYTEST_DONT_REWRITE to its docstring.
- Disable rewriting for all modules by using --assert=plain.

2.3 How to use fixtures

See also:

About fixtures

See also:

Fixtures reference

2.3.1 “Requesting” fixtures

At a basic level, test functions request fixtures they require by declaring them as arguments.

When pytest goes to run a test, it looks at the parameters in that test function’s signature, and then searches for fixtures that have the same names as those parameters. Once pytest finds them, it runs those fixtures, captures what they returned (if anything), and passes those objects into the test function as arguments.

Quick example

```python
import pytest

class Fruit:
    def __init__(self, name):
        self.name = name
        self.cubed = False

    def cube(self):
        self.cubed = True

class FruitSalad:
    def __init__(self, *fruit_bowl):
        self.fruit = fruit_bowl
        self._cube_fruit()

    def _cube_fruit(self):
        for fruit in self.fruit:
            fruit.cube()

# Arrange
@ pytest.fixture
```
def fruit_bowl():
    return [Fruit("apple"), Fruit("banana")]

def test_fruit_salad(fruit_bowl):
    # Act
    fruit_salad = FruitSalad(*fruit_bowl)

    # Assert
    assert all(fruit.cubed for fruit in fruit_salad.fruit)

In this example, `test_fruit_salad` "requests" `fruit_bowl` (i.e., `def test_fruit_salad(fruit_bowl):`), and when pytest sees this, it will execute the `fruit_bowl` fixture function and pass the object it returns into `test_fruit_salad` as the `fruit_bowl` argument.

Here’s roughly what’s happening if we were to do it by hand:

```python
def fruit_bowl():
    return [Fruit("apple"), Fruit("banana")]

def test_fruit_salad(fruit_bowl):
    # Act
    fruit_salad = FruitSalad(*fruit_bowl)

    # Assert
    assert all(fruit.cubed for fruit in fruit_salad.fruit)

    # Arrange
    bowl = fruit_bowl()
    test_fruit_salad(fruit_bowl=bowl)
```

Fixtures can request other fixtures

One of pytest’s greatest strengths is its extremely flexible fixture system. It allows us to boil down complex requirements for tests into more simple and organized functions, where we only need to have each one describe the things they are dependent on. We’ll get more into this further down, but for now, here’s a quick example to demonstrate how fixtures can use other fixtures:

```python
# contents of test_append.py
import pytest

# Arrange
@fixture
def first_entry():
    return "a"

# Arrange
@fixture
def order(first_entry):
    return [first_entry]
```

(continues on next page)
def test_string(order):
    # Act
    order.append("b")

    # Assert
    assert order == ["a", "b"]

Notice that this is the same example from above, but very little changed. The fixtures in pytest request fixtures just like tests. All the same requesting rules apply to fixtures that do for tests. Here's how this example would work if we did it by hand:

```python
def first_entry():
    return "a"

def order(first_entry):
    return [first_entry]

def test_string(order):
    # Act
    order.append("b")

    # Assert
    assert order == ["a", "b"]

entry = first_entry()
the_list = order(first_entry=entry)
test_string(order=the_list)
```

**Fixtures are reusable**

One of the things that makes pytest's fixture system so powerful, is that it gives us the ability to define a generic setup step that can be reused over and over, just like a normal function would be used. Two different tests can request the same fixture and have pytest give each test their own result from that fixture.

This is extremely useful for making sure tests aren't affected by each other. We can use this system to make sure each test gets its own fresh batch of data and is starting from a clean state so it can provide consistent, repeatable results.

Here's an example of how this can come in handy:

```python
# contents of test_append.py
import pytest

# Arrange
@ pytest.fixture
def first_entry():
    return "a"

# Arrange
@ pytest.fixture
def first_entry():
    return "a"
```
def order(first_entry):
    return [first_entry]

def test_string(order):
    # Act
    order.append("b")

    # Assert
    assert order == ["a", "b"]

def test_int(order):
    # Act
    order.append(2)

    # Assert
    assert order == ["a", 2]

Each test here is being given its own copy of that list object, which means the order fixture is getting executed twice (the same is true for the first_entry fixture). If we were to do this by hand as well, it would look something like this:

def first_entry():
    return "a"

def order(first_entry):
    return [first_entry]

def test_string(order):
    # Act
    order.append("b")

    # Assert
    assert order == ["a", "b"]

def test_int(order):
    # Act
    order.append(2)

    # Assert
    assert order == ["a", 2]

entry = first_entry()
the_list = order(first_entry=entry)
test_string(order=the_list)

entry = first_entry()
the_list = order(first_entry=entry)
test_int(order=the_list)
A testfixture can request more than one fixture at a time

Tests and fixtures aren't limited to requesting a single fixture at a time. They can request as many as they like. Here's another quick example to demonstrate:

```python
# contents of test_append.py
import pytest

# Arrange
@ pytest.fixture
def first_entry():
    return "a"

# Arrange
@ pytest.fixture
def second_entry():
    return 2

# Arrange
@ pytest.fixture
def order(first_entry, second_entry):
    return [first_entry, second_entry]

# Arrange
@ pytest.fixture
def expected_list():
    return ["a", 2, 3.0]

def test_string(order, expected_list):
    # Act
    order.append(3.0)

    # Assert
    assert order == expected_list
```

Fixtures can be requested more than once per test (return values are cached)

Fixtures can also be requested more than once during the same test, and pytest won't execute them again for that test. This means we can request fixtures in multiple fixtures that are dependent on them (and even again in the test itself) without those fixtures being executed more than once.

```python
# contents of test_append.py
import pytest

# Arrange
@ pytest.fixture
def first_entry():
    return "a"
```

(continues on next page)
# Arrange
@pytest.fixture
def order():
    return []

# Act
@pytest.fixture
def append_first(order, first_entry):
    return order.append(first_entry)

def test_string_only(append_first, order, first_entry):
    # Assert
    assert order == [first_entry]

If a requested fixture was executed once for every time it was requested during a test, then this test would fail because both append_first and test_string_only would see order as an empty list (i.e. []), but since the return value of order was cached (along with any side effects executing it may have had) after the first time it was called, both the test and append_first were referencing the same object, and the test saw the effect append_first had on that object.

### 2.3.2 Autouse fixtures (fixtures you don’t have to request)

Sometimes you may want to have a fixture (or even several) that you know all your tests will depend on. “Autouse” fixtures are a convenient way to make all tests automatically request them. This can cut out a lot of redundant requests, and can even provide more advanced fixture usage (more on that further down).

We can make a fixture an autouse fixture by passing in autouse=True to the fixture’s decorator. Here’s a simple example for how they can be used:

```python
# contents of test_append.py
import pytest

@pytest.fixture
def first_entry():
    return "a"

@pytest.fixture
def order(first_entry):
    return []

@pytest.fixture(autouse=True)
def append_first(order, first_entry):
    return order.append(first_entry)

def test_string_only(order, first_entry):
    assert order == [first_entry]

def test_string_and_int(order, first_entry):
    # Assert
    assert order == [first_entry]
```

(continues on next page)
order.append(2)
assert order == [first_entry, 2]

In this example, the append_first fixture is an autouse fixture. Because it happens automatically, both tests are affected by it, even though neither test requested it. That doesn’t mean they can’t be requested though; just that it isn’t necessary.

2.3.3 Scope: sharing fixtures across classes, modules, packages or session

Fixtures requiring network access depend on connectivity and are usually time-expensive to create. Extending the previous example, we can add a scope="module" parameter to the @pytest.fixture invocation to cause a smtp_connection fixture function, responsible to create a connection to a preexisting SMTP server, to only be invoked once per test module (the default is to invoke once per test function). Multiple test functions in a test module will thus each receive the same smtp_connection fixture instance, thus saving time. Possible values for scope are: function, class, module, package or session.

The next example puts the fixture function into a separate conftest.py file so that tests from multiple test modules in the directory can access the fixture function:

```python
# content of conftest.py
import smtplib
import pytest

@ pytest.fixture(scope="module")
def smtp_connection():
    return smtplib.SMTP("smtp.gmail.com", 587, timeout=5)

# content of test_module.py

def test_ehlo(smtp_connection):
    response, msg = smtp_connection.ehlo()
    assert response == 250
    assert b"smtp.gmail.com" in msg
    assert 0 # for demo purposes

def test_noop(smtp_connection):
    response, msg = smtp_connection.noop()
    assert response == 250
    assert 0 # for demo purposes
```

Here, the test_ehlo needs the smtp_connection fixture value. pytest will discover and call the @pytest.fixture marked smtp_connection fixture function. Running the test looks like this:

```
$ pytest test_module.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items

test_module.py FF [100%]
```

(continues on next page)
smtp_connection = <smtplib.SMTP object at 0xdeadbeef0001>

def test_ehlo(smtp_connection):
    response, msg = smtp_connection.ehlo()
    assert response == 250
    assert b"smtp.gmail.com" in msg
  > assert 0  # for demo purposes
E  assert 0

test_module.py:7: AssertionError

smtp_connection = <smtplib.SMTP object at 0xdeadbeef0001>

def test_noop(smtp_connection):
    response, msg = smtp_connection.noop()
    assert response == 250
  > assert 0  # for demo purposes
E  assert 0

test_module.py:13: AssertionError

You see the two assert 0 failing and more importantly you can also see that the exactly same smtp_connection object was passed into the two test functions because pytest shows the incoming argument values in the traceback. As a result, the two test functions using smtp_connection run as quick as a single one because they reuse the same instance.

If you decide that you rather want to have a session-scoped smtp_connection instance, you can simply declare it:

```python
@fixture(scope="session")
def smtp_connection():
    # the returned fixture value will be shared for
    # all tests requesting it
    ...
```

**Fixture scopes**

Fixtures are created when first requested by a test, and are destroyed based on their **scope**:

- **function**: the default scope, the fixture is destroyed at the end of the test.
- **class**: the fixture is destroyed during teardown of the last test in the class.
- **module**: the fixture is destroyed during teardown of the last test in the module.
- **package**: the fixture is destroyed during teardown of the last test in the package where the fixture is defined, including sub-packages and sub-directories within it.
- **session**: the fixture is destroyed at the end of the test session.
Note: Pytest only caches one instance of a fixture at a time, which means that when using a parametrized fixture, pytest may invoke a fixture more than once in the given scope.

Dynamic scope

Added in version 5.2.

In some cases, you might want to change the scope of the fixture without changing the code. To do that, pass a callable to `scope`. The callable must return a string with a valid scope and will be executed only once - during the fixture definition. It will be called with two keyword arguments - `fixture_name` as a string and `config` with a configuration object.

This can be especially useful when dealing with fixtures that need time for setup, like spawning a docker container. You can use the command-line argument to control the scope of the spawned containers for different environments. See the example below.

```python
def determine_scope(fixture_name, config):
    if config.getoption("--keep-containers", None):
        return "session"
    return "function"

@pytest.fixture(scope=determine_scope)
def docker_container():
    yield spawn_container()
```

2.3.4 Teardown/Cleanup (AKA Fixture finalization)

When we run our tests, we'll want to make sure they clean up after themselves so they don't mess with any other tests (and also so that we don't leave behind a mountain of test data to bloat the system). Fixtures in pytest offer a very useful teardown system, which allows us to define the specific steps necessary for each fixture to clean up after itself.

This system can be leveraged in two ways.

1. **yield fixtures** (recommended)

   “Yield” fixtures `yield` instead of `return`. With these fixtures, we can run some code and pass an object back to the requesting fixture/test, just like with the other fixtures. The only differences are:
   
   1. `return` is swapped out for `yield`.
   2. Any teardown code for that fixture is placed `after` the `yield`.

   Once pytest figures out a linear order for the fixtures, it will run each one up until it returns or yields, and then move on to the next fixture in the list to do the same thing.

   Once the test is finished, pytest will go back down the list of fixtures, but in the reverse order, taking each one that yielded, and running the code inside it that was `after` the `yield` statement.

   As a simple example, consider this basic email module:

   ```python
   # content of emaillib.py
   class MailAdminClient:
       def create_user(self):
           return MailUser()
   ```

2.3. How to use fixtures
def delete_user(self, user):
    # do some cleanup
    pass

class MailUser:
    def __init__(self):
        self.inbox = []

    def send_email(self, email, other):
        other.inbox.append(email)

    def clear_mailbox(self):
        self.inbox.clear()

class Email:
    def __init__(self, subject, body):
        self.subject = subject
        self.body = body

Let's say we want to test sending email from one user to another. We'll have to first make each user, then send the email from one user to the other, and finally assert that the other user received that message in their inbox. If we want to clean up after the test runs, we'll likely have to make sure the other user's mailbox is emptied before deleting that user, otherwise the system may complain.

Here's what that might look like:

# content of test_emaillib.py
from emaillib import Email, MailAdminClient
import pytest

@ pytest.fixture
def mail_admin()
    return MailAdminClient()

@ pytest.fixture
def sending_user(mail_admin):
    user = mail_admin.create_user()
    yield user
    mail_admin.delete_user(user)

@ pytest.fixture
def receiving_user(mail_admin):
    user = mail_admin.create_user()
    yield user
    user.clear_mailbox()
    mail_admin.delete_user(user)

def test_email_received(sending_user, receiving_user):
    email = Email(subject="Hey!", body="How's it going?")
Because `receiving_user` is the last fixture to run during setup, it’s the first to run during teardown.

There is a risk that even having the order right on the teardown side of things doesn’t guarantee a safe cleanup. That’s covered in a bit more detail in Safe teardowns.

```sh
$ pytest -q test_emaillib.py
.
1 passed in 0.12s
```

### Handling errors for yield fixture

If a yield fixture raises an exception before yielding, pytest won’t try to run the teardown code after that yield fixture’s `yield` statement. But, for every fixture that has already run successfully for that test, pytest will still attempt to tear them down as it normally would.

#### 2. Adding finalizers directly

While yield fixtures are considered to be the cleaner and more straightforward option, there is another choice, and that is to add “finalizer” functions directly to the test’s request-context object. It brings a similar result as yield fixtures, but requires a bit more verbosity.

In order to use this approach, we have to request the `request-context` object (just like we would request another fixture) in the fixture we need to add teardown code for, and then pass a callable, containing that teardown code, to its `addfinalizer` method.

We have to be careful though, because pytest will run that finalizer once it’s been added, even if that fixture raises an exception after adding the finalizer. So to make sure we don’t run the finalizer code when we wouldn’t need to, we would only add the finalizer once the fixture would have done something that we’d need to teardown.

Here’s how the previous example would look using the `addfinalizer` method:

```python
# content of test_emaillib.py
from emaillib import Email, MailAdminClient

import pytest

@ pytest.fixture
def mail_admin():
    return MailAdminClient()

@ pytest.fixture
def sending_user(mail_admin):
    user = mail_admin.create_user()
    yield user
    mail_admin.delete_user(user)

@ pytest.fixture
def receiving_user(mail_admin, request):

```
user = mail_admin.create_user()

    def delete_user():
        mail_admin.delete_user(user)

    request.addfinalizer(delete_user)
    return user

@ pytest.fixture
def email(sending_user, receiving_user, request):
    _email = Email(subject="Hey!", body="How's it going?")
    sending_user.send_email(_email, receiving_user)

    def empty_mailbox():
        receiving_user.clear_mailbox()

    request.addfinalizer(empty_mailbox)
    return _email

def test_email_received(receiving_user, email):
    assert email in receiving_user.inbox

It's a bit longer than yield fixtures and a bit more complex, but it does offer some nuances for when you’re in a pinch.

$ pytest -q test_emaillib.py
.
1 passed in 0.12s

Note on finalizer order

Finalizers are executed in a first-in-last-out order. For yield fixtures, the first teardown code to run is from the right-most fixture, i.e. the last test parameter.

# content of test_finalizers.py
import pytest

def test_bar(fix_w_yield1, fix_w_yield2):
    print("test_bar")

@ pytest.fixture
def fix_w_yield1():
    yield
    print("after_yield_1")

@ pytest.fixture
def fix_w_yield2():
    yield
    print("after_yield_2")
For finalizers, the first fixture to run is last call to `request.addfinalizer`.

```python
# content of test_finalizers.py
from functools import partial
import pytest

@ pytest.fixture
def fix_w_finalizers(request):
    request.addfinalizer(partial(print, "finalizer_2"))
    request.addfinalizer(partial(print, "finalizer_1"))

def test_bar(fix_w_finalizers):
    print("test_bar")
```

This is so because yield fixtures use `addfinalizer` behind the scenes: when the fixture executes, `addfinalizer` registers a function that resumes the generator, which in turn calls the teardown code.

### 2.3.5 Safe teardowns

The fixture system of pytest is very powerful, but it’s still being run by a computer, so it isn’t able to figure out how to safely teardown everything we throw at it. If we aren’t careful, an error in the wrong spot might leave stuff from our tests behind, and that can cause further issues pretty quickly.

For example, consider the following tests (based off of the mail example from above):

```python
# content of test_emaillib.py
from emaillib import Email, MailAdminClient
```

(continues on next page)
import pytest

@pytest.fixture
def setup():
    mail_admin = MailAdminClient()
    sending_user = mail_admin.create_user()
    receiving_user = mail_admin.create_user()
    email = Email(subject="Hey!", body="How's it going?")
    sending_user.send_email(email, receiving_user)
    yield receiving_user, email
    receiving_user.clear_mailbox()
    mail_admin.delete_user(sending_user)
    mail_admin.delete_user(receiving_user)

def test_email_received(setup):
    receiving_user, email = setup
    assert email in receiving_user.inbox

This version is a lot more compact, but it’s also harder to read, doesn’t have a very descriptive fixture name, and none of the fixtures can be reused easily.

There’s also a more serious issue, which is that if any of those steps in the setup raise an exception, none of the teardown code will run.

One option might be to go with the addfinalizer method instead of yield fixtures, but that might get pretty complex and difficult to maintain (and it wouldn’t be compact anymore).

```
$ pytest -q test_emaillib.py
.
1 passed in 0.12s
```

### Safe fixture structure

The safest and simplest fixture structure requires limiting fixtures to only making one state-changing action each, and then bundling them together with their teardown code, as the email examples above showed.

The chance that a state-changing operation can fail but still modify state is negligible, as most of these operations tend to be transaction-based (at least at the level of testing where state could be left behind). So if we make sure that any successful state-changing action gets torn down by moving it to a separate fixture function and separating it from other, potentially failing state-changing actions, then our tests will stand the best chance at leaving the test environment the way they found it.

For an example, let’s say we have a website with a login page, and we have access to an admin API where we can generate users. For our test, we want to:

1. Create a user through that admin API
2. Launch a browser using Selenium
3. Go to the login page of our site
4. Log in as the user we created
5. Assert that their name is in the header of the landing page
We wouldn’t want to leave that user in the system, nor would we want to leave that browser session running, so we’ll want to make sure the fixtures that create those things clean up after themselves.

Here’s what that might look like:

Note: For this example, certain fixtures (i.e. base_url and admin_credentials) are implied to exist elsewhere. So for now, let’s assume they exist, and we’re just not looking at them.

```python
from uuid import uuid4
from urllib.parse import urljoin
from selenium.webdriver import Chrome
import pytest

from src.utils.pages import LoginPage, LandingPage
from src.utils import AdminApiClient
from src.utils.data_types import User

@ pytest.fixture
def admin_client(base_url, admin_credentials):
    return AdminApiClient(base_url, **admin_credentials)

@ pytest.fixture
def user(admin_client):
    _user = User(name="Susan", username=f"testuser-{uuid4()}", password="P4$$word")
    admin_client.create_user(_user)
    yield _user
    admin_client.delete_user(_user)

@ pytest.fixture
def driver():
    _driver = Chrome()
    yield _driver
    _driver.quit()

@ pytest.fixture
def login(driver, base_url, user):
    driver.get(urljoin(base_url, "/login"))
    page = LoginPage(driver)
    page.login(user)

@ pytest.fixture
def landing_page(driver, login):
    return LandingPage(driver)

def test_name_on_landing_page_after_login(landing_page, user):
    assert landing_page.header == f"Welcome, {user.name}!"
```

The way the dependencies are laid out means it’s unclear if the `user` fixture would execute before the `driver` fixture. But that’s ok, because those are atomic operations, and so it doesn’t matter which one runs first because the sequence of events for the test is still linearizable. But what does matter is that, no matter which one runs first, if the one raises an
exception while the other would not have, neither will have left anything behind. If `driver` executes before `user`, and `user` raises an exception, the driver will still quit, and the user was never made. And if `driver` was the one to raise the exception, then the driver would never have been started and the user would never have been made.

### 2.3.6 Running multiple assert statements safely

Sometimes you may want to run multiple asserts after doing all that setup, which makes sense as, in more complex systems, a single action can kick off multiple behaviors. pytest has a convenient way of handling this and it combines a bunch of what we’ve gone over so far.

All that’s needed is stepping up to a larger scope, then having the action step defined as an autouse fixture, and finally, making sure all the fixtures are targeting that higher level scope.

Let’s pull an example from above, and tweak it a bit. Let’s say that in addition to checking for a welcome message in the header, we also want to check for a sign out button, and a link to the user’s profile.

Let’s take a look at how we can structure that so we can run multiple asserts without having to repeat all those steps again.

---

**Note:** For this example, certain fixtures (i.e. `base_url` and `admin_credentials`) are implied to exist elsewhere. So for now, let’s assume they exist, and we’re just not looking at them.

```python
# contents of tests/end_to_end/test_login.py
from uuid import uuid4
from urllib.parse import urljoin

from selenium.webdriver import Chrome
import pytest

from src.utils.pages import LoginPage, LandingPage
from src.utils import AdminApiClient
from src.utils.data_types import User

@ pytest.fixture(scope="class")
def admin_client(base_url, admin_credentials):
    return AdminApiClient(base_url, **admin_credentials)

@ pytest.fixture(scope="class")
def user(admin_client):
    _user = User(name="Susan", username=f"testuser-{uuid4()}", password="P4$$word")
    admin_client.create_user(_user)
    yield _user
    admin_client.delete_user(_user)

@ pytest.fixture(scope="class")
def driver():
    _driver = Chrome()
    yield _driver
    _driver.quit()

@ pytest.fixture(scope="class")
def landing_page(driver, login):
    (continues on next page)
```
class TestLandingPageSuccess:
    @pytest.fixture(scope="class", autouse=True)
    def login(self, driver, base_url, user):
        driver.get(urljoin(base_url, "/login"))
        page = LoginPage(driver)
        page.login(user)

    def test_name_in_header(self, landing_page, user):
        assert landing_page.header == f"Welcome, {user.name}!"

    def test_sign_out_button(self, landing_page):
        assert landing_page.sign_out_button.is_displayed()

    def test_profile_link(self, landing_page, user):
        profile_href = urljoin(base_url, f"/profile?id={user.profile_id}")
        assert landing_page.profile_link.get_attribute("href") == profile_href

Notice that the methods are only referencing self in the signature as a formality. No state is tied to the actual test class as it might be in the unittest.TestCase framework. Everything is managed by the pytest fixture system.

Each method only has to request the fixtures that it actually needs without worrying about order. This is because the act fixture is an autouse fixture, and it made sure all the other fixtures executed before it. There’s no more changes of state that need to take place, so the tests are free to make as many non-state-changing queries as they want without risking stepping on the toes of the other tests.

The login fixture is defined inside the class as well, because not every one of the other tests in the module will be expecting a successful login, and the act may need to be handled a little differently for another test class. For example, if we wanted to write another test scenario around submitting bad credentials, we could handle it by adding something like this to the test file:

```
class TestLandingPageBadCredentials:
    @pytest.fixture(scope="class")
    def faux_user(self, user):
        _user = deepcopy(user)
        _user.password = "badpass"
        return _user

    def test_raises_bad_credentials_exception(self, login_page, faux_user):
        with pytest.raises(BadCredentialsException):
            login_page.login(faux_user)
```

### 2.3.7 Fixtures can introspect the requesting test context

Fixture functions can accept the request object to introspect the “requesting” test function, class or module context. Further extending the previous smtp_connection fixture example, let’s read an optional server URL from the test module which uses our fixture:

```
# content of conftest.py
import smtplib
import pytestlib
import pytest

# (continues on next page)
```
@pytest.fixture(scope="module")
def smtp_connection(request):
    server = getattr(request.module, "smtpserver", "smtp.gmail.com")
    smtp_connection = smtplib.SMTP(server, 587, timeout=5)
    yield smtp_connection
    print(f"finalizing \{smtp_connection\} ({server})")
smtp_connection.close()

We use the request.module attribute to optionally obtain an smtpserver attribute from the test module. If we just execute again, nothing much has changed:

```
$ pytest -s -q --tb=no test_module.py
FFfinalizing <smtplib.SMTP object at 0xdeadbeef0002> (smtp.gmail.com)
```

Let’s quickly create another test module that actually sets the server URL in its module namespace:

```
# content of test_anothersmtp.py
smtpserver = "mail.python.org"  # will be read by smtp fixture

def test_showhelo(smtp_connection):
    assert 0, smtp_connection.helo()
```

Running it:

```
$ pytest -qq --tb=short test_anothersmtp.py
F [100%]

test_anothersmtp.py:6: in test_showhelo
    assert 0, smtp_connection.helo()
E   AssertionError: (250, b'mail.python.org')
E   assert 0
```

voila! The smtp_connection fixture function picked up our mail server name from the module namespace.
### 2.3.8 Using markers to pass data to fixtures

Using the `request` object, a fixture can also access markers which are applied to a test function. This can be useful to pass data into a fixture from a test:

```python
import pytest

@ pytest.fixture
def fixt(request):
    marker = request.node.get_closest_marker("fixt_data")
    if marker is None:
        # Handle missing marker in some way...
        data = None
    else:
        data = marker.args[0]

    # Do something with the data
    return data

@ pytest.mark.fxt_data(42)
def test_fxt(fixt):
    assert fixt == 42
```

### 2.3.9 Factories as fixtures

The “factory as fixture” pattern can help in situations where the result of a fixture is needed multiple times in a single test. Instead of returning data directly, the fixture instead returns a function which generates the data. This function can then be called multiple times in the test.

Factories can have parameters as needed:

```python
@ pytest.fixture
def make_customer_record():
    def _make_customer_record(name):
        return {"name": name, "orders": []}

    return _make_customer_record

def test_customer_records(make_customer_record):
    customer_1 = make_customer_record("Lisa")
    customer_2 = make_customer_record("Mike")
    customer_3 = make_customer_record("Meredith")
```

If the data created by the factory requires managing, the fixture can take care of that:

```python
@ pytest.fixture
def make_customer_record():
    created_records = []

    def _make_customer_record(name):
        record = models.Customer(name=name, orders=[])
        created_records.append(record)
        return record
```

(continues on next page)
yield _make_customer_record

for record in created_records:
    record.destroy()

def test_customer_records(make_customer_record):
    customer_1 = make_customer_record("Lisa")
    customer_2 = make_customer_record("Mike")
    customer_3 = make_customer_record("Meredith")

2.3.10 Parametrizing fixtures

Fixture functions can be parametrized in which case they will be called multiple times, each time executing the set of dependent tests, i.e. the tests that depend on this fixture. Test functions usually do not need to be aware of their re-running. Fixture parametrization helps to write exhaustive functional tests for components which themselves can be configured in multiple ways.

Extending the previous example, we can flag the fixture to create two smtp_connection fixture instances which will cause all tests using the fixture to run twice. The fixture function gets access to each parameter through the special request object:

```python
# content of conftest.py
import smtplib
import pytest

@ pytest.fixture(scope="module", params=["smtp.gmail.com", "mail.python.org"])
def smtp_connection(request):
    smtp_connection = smtplib.SMTP(request.param, 587, timeout=5)
    yield smtp_connection
    print(f"finalizing {smtp_connection}")
    smtp_connection.close()
```

The main change is the declaration of params with @pytest.fixture, a list of values for each of which the fixture function will execute and can access a value via request.param. No test function code needs to change. So let's just do another run:

```bash
$ pytest -q test_module.py
FFFF [100%]  
================================ FAILURES =================================
_____________________________ test_ehlo[smtp.gmail.com] _______________________  
smtp_connection = <smtplib.SMTP object at 0xdeadbeef0004>
  def test_ehlo(smtp_connection):
      response, msg = smtp_connection.ehlo()
      assert response == 250
      assert b"smtp.gmail.com" in msg
>     assert 0  # for demo purposes
E     assert 0
```

(continues on next page)
We see that our two test functions each ran twice, against the different smtp_connection instances. Note also, that with the mail.python.org connection the second test fails in test_ehlo because a different server string is expected than what arrived.

pytest will build a string that is the test ID for each fixture value in a parametrized fixture, e.g. test_ehlo[smtp.gmail.com] and test_ehlo[mail.python.org] in the above examples. These IDs can be used with -k to select specific cases to run, and they will also identify the specific case when one is failing. Running pytest with --collect-only will show the generated IDs.

Numbers, strings, booleans and None will have their usual string representation used in the test ID. For other objects, pytest will make a string based on the argument name. It is possible to customise the string used in a test ID for a certain

### 2.3. How to use fixtures
fixture value by using the `ids` keyword argument:

```python
# content of test_ids.py
import pytest

@pytest.fixture(params=[0, 1], ids=['spam', 'ham'])
def a(request):
    return request.param

def test_a(a):
    pass

def idfn(fixture_value):
    if fixture_value == 0:
        return 'eggs'
    else:
        return None

@ pytest.fixture(params=[0, 1], ids=idfn)
def b(request):
    return request.param

def test_b(b):
    pass
```

The above shows how `ids` can be either a list of strings to use or a function which will be called with the fixture value and then has to return a string to use. In the latter case if the function returns `None` then pytest's auto-generated ID will be used.

Running the above tests results in the following test IDs being used:

```bash
$ pytest --collect-only
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 12 items

<Dir fixtures.rst-219>
  <Module test_anothersmtp.py>
    <Function test_showhelo[smtp.gmail.com]>
    <Function test_showhelo[mail.python.org]>
  <Module test_emaillib.py>
    <Function test_email_received>
  <Module test_finalizers.py>
    <Function test_bar>
  <Module test_ids.py>
    <Function test_a[spam]>
    <Function test_a[ham]>
    <Function test_b[eggs]>
    <Function test_b[1]>
  <Module test_module.py>
    <Function test_ehlo[smtp.gmail.com]>
    <Function test_noop[smtp.gmail.com]>
```
2.3.11 Using marks with parametrized fixtures

`pytest.param()` can be used to apply marks in values sets of parametrized fixtures in the same way that they can be used with `@pytest.mark.parametrize`.

Example:

```python
# content of test_fixture_marks.py
import pytest

@pytest.fixture(params=[0, 1, pytest.param(2, marks=pytest.mark.skip)])
def data_set(request):
    return request.param

def test_data(data_set):
    pass
```

Running this test will skip the invocation of `data_set` with value 2:

```
$ pytest test_fixture_marks.py -v
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ...
... collected 3 items

test_fixture_marks.py::test_data[0] PASSED [ 33%]
test_fixture_marks.py::test_data[1] PASSED [ 66%]
test_fixture_marks.py::test_data[2] SKIPPED (unconditional skip) [100%]
======================== 2 passed, 1 skipped in 0.12s =========================
```

2.3.12 Modularity: using fixtures from a fixture function

In addition to using fixtures in test functions, fixture functions can use other fixtures themselves. This contributes to a modular design of your fixtures and allows re-use of framework-specific fixtures across many projects. As a simple example, we can extend the previous example and instantiate an object `app` where we stick the already defined `smtp_connection` resource into it:

```python
# content of test_appsetup.py
import pytest

class App:
```

(continues on next page)
def __init__(self, smtp_connection):
    self.smtp_connection = smtp_connection

@pytest.fixture(scope="module")
def app(smtp_connection):
    return App(smtp_connection)

def test_smtp_connection_exists(app):
    assert app.smtp_connection

Here we declare an app fixture which receives the previously defined smtp_connection fixture and instantiates an App object with it. Let’s run it:

$ pytest -v test_appsetup.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
→ python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 2 items

test_appsetup.py::test_smtp_connection_exists[smtp.gmail.com] PASSED [ 50%]
test_appsetup.py::test_smtp_connection_exists[mail.python.org] PASSED [100%]

============================ 2 passed in 0.12s =============================

Due to the parametrization of smtp_connection, the test will run twice with two different App instances and respective smtp servers. There is no need for the app fixture to be aware of the smtp_connection parametrization because pytest will fully analyse the fixture dependency graph.

Note that the app fixture has a scope of module and uses a module-scoped smtp_connection fixture. The example would still work if smtp_connection was cached on a session scope: it is fine for fixtures to use “broader” scoped fixtures but not the other way round: A session-scoped fixture could not use a module-scoped one in a meaningful way.

2.3.13 Automatic grouping of tests by fixture instances

pytest minimizes the number of active fixtures during test runs. If you have a parametrized fixture, then all the tests using it will first execute with one instance and then finalizers are called before the next fixture instance is created. Among other things, this eases testing of applications which create and use global state.

The following example uses two parametrized fixtures, one of which is scoped on a per-module basis, and all the functions perform print calls to show the setup/teardown flow:

# content of test_module.py
import pytest

@pytest.fixture(scope="module", params=["mod1", "mod2"])
def modarg(request):
    param = request.param
    print(" SETUP modarg", param)
    yield param
    print(" TEARDOWN modarg", param)
@pytest.fixture(scope="function", params=[1, 2])
def otherarg(request):
    param = request.param
    print(" SETUP otherarg", param)
    yield param
    print(" TEARDOWN otherarg", param)

def test_0(otherarg):
    print(" RUN test0 with otherarg", otherarg)

def test_1(modarg):
    print(" RUN test1 with modarg", modarg)

def test_2(otherarg, modarg):
    print(f" RUN test2 with otherarg {otherarg} and modarg {modarg}"
L
Let's run the tests in verbose mode and with looking at the print-output:

$ pytest -v -s test_module.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
--python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 8 items
test_module.py::test_0[1] SETUP otherarg 1
  RUN test0 with otherarg 1
  PASSED
  TEARDOWN otherarg 1
test_module.py::test_0[2] SETUP otherarg 2
  RUN test0 with otherarg 2
  PASSED
  TEARDOWN otherarg 2
test_module.py::test_1[mod1] SETUP modarg mod1
  RUN test1 with modarg mod1
  PASSED
test_module.py::test_2[mod1-1] SETUP otherarg 1
  RUN test2 with otherarg 1 and modarg mod1
  PASSED
  TEARDOWN otherarg 1
test_module.py::test_2[mod1-2] SETUP otherarg 2
  RUN test2 with otherarg 2 and modarg mod1
  PASSED
  TEARDOWN otherarg 2
test_module.py::test_1[mod2] TEARDOWN modarg mod1
  SETUP modarg mod2
  RUN test1 with modarg mod2
  PASSED
test_module.py::test_2[mod2-1] SETUP otherarg 1
  RUN test2 with otherarg 1 and modarg mod2
  PASSED
  TEARDOWN otherarg 1
test_module.py::test_2[mod2-2]  SETUP otherarg 2
  RUN test2 with otherarg 2 and modarg mod2
PASSED  TEARDOWN otherarg 2
  TEARDOWN modarg mod2

============= 8 passed in 0.12s ==============

You can see that the parametrized module-scoped modarg resource caused an ordering of test execution that lead to the fewest possible “active” resources. The finalizer for the mod1 parametrized resource was executed before the mod2 resource was setup.

In particular notice that test_0 is completely independent and finishes first. Then test_1 is executed with mod1, then test_2 with mod1, then test_1 with mod2 and finally test_2 with mod2.

The otherarg parametrized resource (having function scope) was set up before and teared down after every test that used it.

### 2.3.14 Use fixtures in classes and modules with usefixtures

Sometimes test functions do not directly need access to a fixture object. For example, tests may require to operate with an empty directory as the current working directory but otherwise do not care for the concrete directory. Here is how you can use the standard `tempfile` and pytest fixtures to achieve it. We separate the creation of the fixture into a `conftest.py` file:

```python
# content of conftest.py
import os
import tempfile
import pytest

@pytest.fixture
def cleandir():
    with tempfile.TemporaryDirectory() as newpath:
        old_cwd = os.getcwd()
        os.chdir(newpath)
        yield
        os.chdir(old_cwd)
```

and declare its use in a test module via a `usefixtures` marker:

```python
# content of test_setenv.py
import os
import pytest

@pytest.mark.usefixtures("cleandir")
class TestDirectoryInit:
    def test_cwd_starts_empty(self):
        assert os.listdir(os.getcwd()) == []
        with open("myfile", "w", encoding="utf-8") as f:
```

(continues on next page)
Due to the `usefixtures` marker, the `cleandir` fixture will be required for the execution of each test method, just as if you specified a “cleandir” function argument to each of them. Let’s run it to verify our fixture is activated and the tests pass:

```bash
$ pytest -q
.. [100%]
2 passed in 0.12s
```

You can specify multiple fixtures like this:

```python
@ pytest.mark.usefixtures("cleandir", "anotherfixture")
def test(): ...
```

and you may specify fixture usage at the test module level using `pytestmark`:

```python
pytestmark = pytest.mark.usefixtures("cleandir")
```

It is also possible to put fixtures required by all tests in your project into an ini-file:

```ini
# content of pytest.ini
[pytest]
usefixtures = cleandir
```

**Warning:** Note this mark has no effect in fixture functions. For example, this will not work as expected:

```python
@ pytest.mark.usefixtures("my_other_fixture")
@ pytest.fixture
def my_fixture_that_sadly_wont_use_my_other_fixture(): ...
```

This generates a deprecation warning, and will become an error in Pytest 8.

### 2.3.15 Overriding fixtures on various levels

In relatively large test suite, you most likely need to override a global or root fixture with a locally defined one, keeping the test code readable and maintainable.

**Override a fixture on a folder (conftest) level**

Given the tests file structure is:

```python
tests/
    conftest.py
        # content of tests/conftest.py
        import pytest
        @ pytest.fixture
        def username():
```

(continues on next page)
As you can see, a fixture with the same name can be overridden for certain test folder level. Note that the base or super fixture can be accessed from the overriding fixture easily - used in the example above.

**Override a fixture on a test module level**

Given the tests file structure is:

```python
# content of tests/test_something.py
import pytest
@ pytest.fixture
def username(username):
    return 'overridden-' + username

def test_username(username):
    assert username == 'overridden-username'

test_something_else.py
# content of tests/subfolder/test_something_else.py
import pytest
@ pytest.fixture
def username(username):
    return 'overridden-else-' + username

def test_username(username):
    assert username == 'overridden-username'
```

(continues on next page)
def test_username(username):
    assert username == 'overridden-else-username'

In the example above, a fixture with the same name can be overridden for certain test module.

### Override a fixture with direct test parametrization

Given the tests file structure is:

```python
# tests/conftest.py
import pytest

@pytest.fixture
def username():
    return 'username'

@pytest.fixture
def other_username(username):
    return 'other-' + username

# tests/test_something.py
import pytest

@pytest.mark.parametrize('username', ['directly-overridden-username'])
def test_username(username):
    assert username == 'directly-overridden-username'

@pytest.mark.parametrize('username', ['directly-overridden-username-other'])
def test_username_other(other_username):
    assert other_username == 'other-directly-overridden-username-other'
```

In the example above, a fixture value is overridden by the test parameter value. Note that the value of the fixture can be overridden this way even if the test doesn't use it directly (doesn't mention it in the function prototype).

### Override a parametrized fixture with non-parametrized one and vice versa

Given the tests file structure is:

```python
# tests/conftest.py
import pytest

@pytest.fixture(params=['one', 'two', 'three'])
def parametrized_username(request):
    return request.param

@pytest.fixture
def non_parametrized_username(request):
    return 'username'
```

2.3. How to use fixtures
test_something.py

# content of tests/test_something.py
import pytest

@ pytest.fixture
def parametrized_username():
    return 'overridden-username'

@ pytest.fixture(params=['one', 'two', 'three'])
def non_parametrized_username(request):
    return request.param

def test_username(parametrized_username):
    assert parametrized_username == 'overridden-username'

def test_parametrized_username(non_parametrized_username):
    assert non_parametrized_username in ['one', 'two', 'three']

test_something_else.py

# content of tests/test_something_else.py

def test_username(parametrized_username):
    assert parametrized_username in ['one', 'two', 'three']

def test_username(non_parametrized_username):
    assert non_parametrized_username == 'username'

In the example above, a parametrized fixture is overridden with a non-parametrized version, and a non-parametrized fixture is overridden with a parametrized version for certain test module. The same applies for the test folder level obviously.

2.3.16 Using fixtures from other projects

Usually projects that provide pytest support will use entry points, so just installing those projects into an environment will make those fixtures available for use.

In case you want to use fixtures from a project that does not use entry points, you can define pytest_plugins in your top conftest.py file to register that module as a plugin.

Suppose you have some fixtures in mylibraryfixtures and you want to reuse them into your app/tests directory.

All you need to do is to define pytest_plugins in app/tests/conftest.py pointing to that module.

```
pytest_plugins = "mylibrary.fixtures"
```

This effectively registers mylibrary.fixtures as a plugin, making all its fixtures and hooks available to tests in app/tests.

**Note:** Sometimes users will import fixtures from other projects for use, however this is not recommended: importing fixtures into a module will register them in pytest as defined in that module.

This has minor consequences, such as appearing multiple times in pytest --help, but it is not recommended because this behavior might change/stop working in future versions.
2.4 How to mark test functions with attributes

By using the pytest.mark helper you can easily set metadata on your test functions. You can find the full list of builtin markers in the API Reference. Or you can list all the markers, including builtin and custom, using the CLI - pytest --markers.

Here are some of the builtin markers:

- `usefixtures` - use fixtures on a test function or class
- `filterwarnings` - filter certain warnings of a test function
- `skip` - always skip a test function
- `skipif` - skip a test function if a certain condition is met
- `xfail` - produce an “expected failure” outcome if a certain condition is met
- `parametrize` - perform multiple calls to the same test function.

It’s easy to create custom markers or to apply markers to whole test classes or modules. Those markers can be used by plugins, and also are commonly used to select tests on the command-line with the `--m` option.

See Working with custom markers for examples which also serve as documentation.

Note: Marks can only be applied to tests, having no effect on fixtures.

2.4.1 Registering marks

You can register custom marks in your pytest.ini file like this:

```ini
[pytest]
markers =
    slow: marks tests as slow (deselect with '-m "not slow"')
    serial
```

or in your pyproject.toml file like this:

```toml
[tool.pytest.ini_options]
markers = [  
    "slow: marks tests as slow (deselect with '-m \"not slow\")","  
    "serial" ,
]
```

Note that everything past the : after the mark name is an optional description.

Alternatively, you can register new markers programmatically in a pytest_configure hook:

```python
def pytest_configure(config):
    config.addinivalue_line(
        "markers", "env(name): mark test to run only on named environment"
    )
```

Registered marks appear in pytest’s help text and do not emit warnings (see the next section). It is recommended that third-party plugins always register their markers.
2.4.2 Raising errors on unknown marks

Unregistered marks applied with the `@pytest.mark.name_of_the_mark` decorator will always emit a warning in order to avoid silently doing something surprising due to mistyped names. As described in the previous section, you can disable the warning for custom marks by registering them in your `pytest.ini` file or using a custom `pytest_configure` hook.

When the `--strict-markers` command-line flag is passed, any unknown marks applied with the `@pytest.mark.name_of_the_mark` decorator will trigger an error. You can enforce this validation in your project by adding `--strict-markers` to `addopts`:

```
[pytest]
addopts = --strict-markers
markers =
    slow: marks tests as slow (deselect with '-m "not slow"')
    serial
```

2.5 How to parametrize fixtures and test functions

`pytest` enables test parametrization at several levels:

- `pytest.fixture()` allows one to parametrize fixture functions.
- `@pytest.mark.parametrize` allows one to define multiple sets of arguments and fixtures at the test function or class.
- `pytest_generate_tests` allows one to define custom parametrization schemes or extensions.

2.5.1 `@pytest.mark.parametrize`: parametrizing test functions

The built-in `pytest.mark.parametrize` decorator enables parametrization of arguments for a test function. Here is a typical example of a test function that implements checking that a certain input leads to an expected output:

```python
# content of test_expectation.py
import pytest

@ pytest.mark.parametrize("test_input,expected", [("3+5", 8), ("2+4", 6), ("6*9", 42)])
def test_eval(test_input, expected):
    assert eval(test_input) == expected
```

Here, the `@parametrize` decorator defines three different `(test_input,expected)` tuples so that the `test_eval` function will run three times using them in turn:

```
$ pytest
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 3 items

test_expectation.py ..F [100%]

================================ FAILURES ================================
__________________________ test_eval[6*9-42] ____________________________
(continues on next page)
```
test_input = '6*9', expected = 42

@ pytest.mark.parametrize("test_input,expected", [(["3+5", 8], ["2+4", 6], ["6*9", 42])])
def test_eval(test_input, expected):
    > assert eval(test_input) == expected
    E   AssertionError: assert 54 == 42
    E    + where 54 = eval('6*9')

test_expectation.py:6: AssertionError
================================= short test summary info ==========================
FAILED test_expectation.py::test_eval[6*9-42] - AssertionError: assert 54...
================================= 1 failed, 2 passed in 0.12s ========================

Note: Parameter values are passed as-is to tests (no copy whatsoever).

For example, if you pass a list or a dict as a parameter value, and the test case code mutates it, the mutations will be reflected in subsequent test case calls.

Note: pytest by default escapes any non-ascii characters used in unicode strings for the parametrization because it has several downsides. If however you would like to use unicode strings in parametrization and see them in the terminal as is (non-escaped), use this option in your pytest.ini:

[pytest]
disable_test_id_escaping_and_forfeit_all_rights_to_community_support = True

Keep in mind however that this might cause unwanted side effects and even bugs depending on the OS used and plugins currently installed, so use it at your own risk.

As designed in this example, only one pair of input/output values fails the simple test function. And as usual with test function arguments, you can see the input and output values in the traceback.

Note that you could also use the parametrize marker on a class or a module (see How to mark test functions with attributes) which would invoke several functions with the argument sets, for instance:

import pytest

@ pytest.mark.parametrize("n,expected", [(1, 2), (3, 4)])
class TestClass:
    def test_simple_case(self, n, expected):
        assert n + 1 == expected

    def test_weird_simple_case(self, n, expected):
        assert (n * 1) + 1 == expected

To parametrize all tests in a module, you can assign to the pytestmark global variable:

import pytest

pytestmark = pytest.mark.parametrize("n,expected", [(1, 2), (3, 4)])

(continues on next page)
class TestClass:
    def test_simple_case(self, n, expected):
        assert n + 1 == expected
    
    def test_weird_simple_case(self, n, expected):
        assert (n * 1) + 1 == expected

It is also possible to mark individual test instances within parametrize, for example with the builtin `mark.xfail`:

```python
# content of test_expectation.py
import pytest

@ pytest.mark.parametrize(
    "test_input,expected",
    [("3+5", 8), ("2+4", 6), pytest.param("6*9", 42, marks=pytest.mark.xfail)],
)
def test_eval(test_input, expected):
    assert eval(test_input) == expected
```

Let's run this:

```
$ pytest
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 3 items

  test_expectation.py ..x [100%]

======================= 2 passed, 1 xfailed in 0.12s =======================
```

The one parameterset which caused a failure previously now shows up as an “xfailed” (expected to fail) test.

In case the values provided to parametrize result in an empty list - for example, if they’re dynamically generated by some function - the behaviour of pytest is defined by the `empty_parameter_set_mark` option.

To get all combinations of multiple parametrized arguments you can stack parametrize decorators:

```python
import pytest

@ pytest.mark.parametrize("x", [0, 1])
@ pytest.mark.parametrize("y", [2, 3])
def test_foo(x, y):
    pass
```

This will run the test with the arguments set to `x=0`/`y=2`, `x=1`/`y=2`, `x=0`/`y=3`, and `x=1`/`y=3` exhausting parameters in the order of the decorators.
2.5.2 Basic pytest_generate_tests example

Sometimes you may want to implement your own parametrization scheme or implement some dynamism for determining the parameters or scope of a fixture. For this, you can use the `pytest_generate_tests` hook which is called when collecting a test function. Through the passed in `metafunc` object you can inspect the requesting test context and, most importantly, you can call `metafunc.parametrize()` to cause parametrization.

For example, let's say we want to run a test taking string inputs which we want to set via a new `pytest` command line option. Let's first write a simple test accepting a `stringinput` fixture function argument:

```
# content of test_strings.py

def test_valid_string(stringinput):
    assert stringinput.isalpha()
```

Now we add a `conftest.py` file containing the addition of a command line option and the parametrization of our test function:

```
# content of conftest.py

def pytest_addoption(parser):
    parser.addoption("--stringinput",
        action="append",
        default=[],
        help="list of string inputs to pass to test functions",
    )

def pytest_generate_tests(metafunc):
    if "stringinput" in metafunc.fixturenames:
        metafunc.parametrize("stringinput", metafunc.config.getoption("stringinput"))
```

If we now pass two stringinput values, our test will run twice:

```
$ pytest -q --stringinput="hello" --stringinput="world" test_strings.py
.
2 passed in 0.12s
```

Let's also run with a stringinput that will lead to a failing test:

```
$ pytest -q --stringinput="!" test_strings.py
F
====================================================================
== test_valid_string[!] ==
stringinput = '!

  def test_valid_string(stringinput):
    >   assert stringinput.isalpha()
   E   AssertionError: assert False
   E     where False = <built-in method isalpha of str object at 0xdeadbeef0001>()
   E     where <built-in method isalpha of str object at 0xdeadbeef0001> = '!'.
      -isalpha

test_strings.py:4: AssertionError
```

(continues on next page)
As expected our test function fails. If you don’t specify a string input it will be skipped because `metafunc.parametrize()` will be called with an empty parameter list:

```bash
$ pytest -q -rs test_strings.py
```

Note that when calling `metafunc.parametrize()` multiple times with different parameter sets, all parameter names across those sets cannot be duplicated, otherwise an error will be raised.

### 2.5.3 More examples

For further examples, you might want to look at more parametrization examples.

### 2.6 How to use temporary directories and files in tests

#### 2.6.1 The tmp_path fixture

You can use the `tmp_path` fixture which will provide a temporary directory unique to each test function. `tmp_path` is a `pathlib.Path` object. Here is an example test usage:

```python
# content of test_tmp_path.py
CONTENT = "content"

def test_create_file(tmp_path):
    d = tmp_path / "sub"
    d.mkdir()
    p = d / "hello.txt"
    p.write_text(CONTENT, encoding="utf-8")
    assert p.read_text(encoding="utf-8") == CONTENT
    assert len(list(tmp_path.iterdir())) == 1
    assert 0
```

Running this would result in a passed test except for the last `assert 0` line which we use to look at values:

```bash
$ pytest test_tmp_path.py
```

---

(continues from previous page)
By default, pytest retains the temporary directory for the last 3 pytest invocations. Concurrent invocations of the same test function are supported by configuring the base temporary directory to be unique for each concurrent run. See temporary directory location and retention for details.

### 2.6.2 The tmp_path_factory fixture

The `tmp_path_factory` is a session-scoped fixture which can be used to create arbitrary temporary directories from any other fixture or test.

For example, suppose your test suite needs a large image on disk, which is generated procedurally. Instead of computing the same image for each test that uses it into its own `tmp_path`, you can generate it once per-session to save time:

```python
# contents of conftest.py
import pytest

@pytest.fixture(scope="session")
def image_file(tmp_path_factory):
    img = compute_expensive_image()
    fn = tmp_path_factory.mktemp("data") / "img.png"
    img.save(fn)
    return fn

# contents of test_image.py
def test_histogram(image_file):
    img = load_image(image_file)
    # compute and test histogram
```

See [tmp_path_factory API](https://docs.pytest.org/en/latest/tmpdir.html) for details.
2.6.3 The tmpdir and tmpdir_factory fixtures

The tmpdir and tmpdir_factory fixtures are similar to tmp_path and tmp_path_factory, but use/return legacy py.path.local objects rather than standard pathlib.Path objects.

**Note:** These days, it is preferred to use tmp_path and tmp_path_factory.

In order to help modernize old code bases, one can run pytest with the legacypath plugin disabled:

```
pytest -p no:legacypath
```

This will trigger errors on tests using the legacy paths. It can also be permanently set as part of the addopts parameter in the config file.

See tmpdir tmpdir_factory API for details.

2.6.4 Temporary directory location and retention

Temporary directories are by default created as sub-directories of the system temporary directory. The base name will be pytest-NUM where NUM will be incremented with each test run. By default, entries older than 3 temporary directories will be removed. This behavior can be configured with tmp_path_retention_count and tmp_path_retention_policy.

Using the --basetemp option will remove the directory before every run, effectively meaning the temporary directories of only the most recent run will be kept.

You can override the default temporary directory setting like this:

```
pytest --basetemp=mydir
```

**Warning:** The contents of mydir will be completely removed, so make sure to use a directory for that purpose only.

When distributing tests on the local machine using pytest-xdist, care is taken to automatically configure a basetemp directory for the sub processes such that all temporary data lands below a single per-test run temporary directory.

2.7 How to monkeypatch/mock modules and environments

Sometimes tests need to invoke functionality which depends on global settings or which invokes code which cannot be easily tested such as network access. The monkeypatch fixture helps you to safely set/delete an attribute, dictionary item or environment variable, or to modify sys.path for importing.

The monkeypatch fixture provides these helper methods for safely patching and mocking functionality in tests:

- `monkeypatchsetattr(obj, name, value, raising=True)`
- `monkeypatchdelattr(obj, name, raising=True)`
- `monkeypatchsetitem(mapping, name, value)`
- `monkeypatchdelitem(obj, name, raising=True)`
**monkeypatch.setenv(name, value, prepend=None)**  
**monkeypatch.delenv(name, raising=True)**  
**monkeypatch.syspath_prepend(path)**  
**monkeypatch.chdir(path)**  
**monkeypatch.context()**

All modifications will be undone after the requesting test function or fixture has finished. The `raising` parameter determines if a `KeyError` or `AttributeError` will be raised if the target of the set/deletion operation does not exist.

Consider the following scenarios:

1. Modifying the behavior of a function or the property of a class for a test e.g. there is an API call or database connection you will not make for a test but you know what the expected output should be. Use `monkeypatchsetattr` to patch the function or property with your desired testing behavior. This can include your own functions. Use `monkeypatchdelattr` to remove the function or property for the test.

2. Modifying the values of dictionaries e.g. you have a global configuration that you want to modify for certain test cases. Use `monkeypatchsetattr` to patch the dictionary for the test. `monkeypatchdelitem` can be used to remove items.

3. Modifying environment variables for a test e.g. to test program behavior if an environment variable is missing, or to set multiple values to a known variable. `monkeypatchsetattr` and `monkeypatchdelenv` can be used for these patches.

4. Use `monkeypatchsetattr("PATH", value, prepend=os.pathsep)` to modify $PATH, and `monkeypath.chdir` to change the context of the current working directory during a test.

5. Use `monkeypatch.syspath_prepend` to modify sys.path which will also call `pkg_resources.fixup_namespace_packages` and `importlib.invalidate_caches()`.

6. Use `monkeypatchcontext` to apply patches only in a specific scope, which can help control teardown of complex fixtures or patches to the stdlib.

See the [monkeypatch blog post](https://example.com) for some introduction material and a discussion of its motivation.

### 2.7.1 Monkeypatching functions

Consider a scenario where you are working with user directories. In the context of testing, you do not want your test to depend on the running user. `monkeypatch` can be used to patch functions dependent on the user to always return a specific value.

In this example, `monkeypatchsetattr` is used to patch `Path.home` so that the known testing path `Path("/abc")` is always used when the test is run. This removes any dependency on the running user for testing purposes. `monkeypatchsetattr` must be called before the function which will use the patched function is called. After the test function finishes the `Path.home` modification will be undone.

```python
# contents of test_module.py with source code and the test
from pathlib import Path

def getssh():
    """Simple function to return expanded homedir ssh path.""
    return Path.home() / ".ssh"
```

(continues on next page)
```python
def test_getssh(monkeypatch):
    # mocked return function to replace Path.home
    # always return '/abc'
    def mockreturn():
        return Path("/abc")

    # Application of the monkeypatch to replace Path.home
    # with the behavior of mockreturn defined above.
    monkeypatch.setattr(Path, "home", mockreturn)

    # Calling getssh() will use mockreturn in place of Path.home
    # for this test with the monkeypatch.
    x = getssh()
    assert x == Path("/abc/.ssh")
```

2.7.2 Monkeypatching returned objects: building mock classes

`monkeypatchsetattr` can be used in conjunction with classes to mock returned objects from functions instead of values. Imagine a simple function to take an API url and return the json response.

```python
# contents of app.py, a simple API retrieval example
import requests

def get_json(url):
    
    r = requests.get(url)
    return r.json()
```

We need to mock `r`, the returned response object for testing purposes. The mock of `r` needs a `.json()` method which returns a dictionary. This can be done in our test file by defining a class to represent `r`.

```python
# contents of test_app.py, a simple test for our API retrieval
# import requests for the purposes of monkeypatching
import requests

# our app.py that includes the get_json() function
# this is the previous code block example
import app

# custom class to be the mock return value
# will override the requests.Response returned from requests.get
class MockResponse:
    # mock json() method always returns a specific testing dictionary
    @staticmethod
    def json():
        return {"mock_key": "mock_response"}

def test_get_json(monkeypatch):
    # Any arguments may be passed and mock_get() will always return our
    # mocked object, which only has the .json() method.
    def mock_get(*args, **kwargs):
        return MockResponse()
```

(continues on next page)
monkeypatch applies the mock for requests.get with our mock_get function. The mock_get function returns an instance of the MockResponse class, which has a json() method defined to return a known testing dictionary and does not require any outside API connection.

You can build the MockResponse class with the appropriate degree of complexity for the scenario you are testing. For instance, it could include an ok property that always returns True, or return different values from the json() mocked method based on input strings.

This mock can be shared across tests using a fixture:

```python
monkeypatch.setattr(requests, "get", mock_get)

# app.get_json, which contains requests.get, uses the monkeypatch
result = app.get_json("https://fakeurl")
assert result["mock_key"] == "mock_response"
```

Furthermore, if the mock was designed to be applied to all tests, the fixture could be moved to a conftest.py file and use the with autouse=True option.
2.7.3 Global patch example: preventing “requests” from remote operations

If you want to prevent the “requests” library from performing http requests in all your tests, you can do:

```python
# contents of conftest.py
import pytest

@pytest.fixture(autouse=True)
def no_requests(monkeypatch):
    """Remove requests.sessions.Session.request for all tests."""
    monkeypatch.delattr("requests.sessions.Session.request")
```

This autouse fixture will be executed for each test function and it will delete the method `request.session.Session.request` so that any attempts within tests to create http requests will fail.

**Note:** Be advised that it is not recommended to patch builtin functions such as `open`, `compile`, etc., because it might break pytest’s internals. If that’s unavoidable, passing `--tb=native`, `--assert=plain` and `--capture=no` might help although there's no guarantee.

**Note:** Mind that patching `stdlib` functions and some third-party libraries used by pytest might break pytest itself, therefore in those cases it is recommended to use `MonkeyPatch.context()` to limit the patching to the block you want tested:

```python
import functools

def test_partial(monkeypatch):
    with monkeypatch.context() as m:
        m.setattr(functools, "partial", 3)
    assert functools.partial == 3
```

See #3290 for details.

2.7.4 Monkeypatching environment variables

If you are working with environment variables you often need to safely change the values or delete them from the system for testing purposes. `monkeypatch` provides a mechanism to do this using the `setenv` and `delenv` method. Our example code to test:

```python
# contents of our original code file e.g. code.py
import os

def get_os_user_lower():
    """Simple retrieval function. Returns lowercase USER or raises OSError."""
    username = os.getenv("USER")
    if username is None:
        raise OSError("USER environment is not set.")
    return username.lower()
```
There are two potential paths. First, the USER environment variable is set to a value. Second, the USER environment variable does not exist. Using monkeypatch both paths can be safely tested without impacting the running environment:

```python
# contents of our test file e.g. test_code.py
import pytest

def test_upper_to_lower(monkeypatch):
    """Set the USER env var to assert the behavior.""
    monkeypatch.setenv("USER", "TestingUser")
    assert get_os_user_lower() == "testinguser"

def test_raise_exception(monkeypatch):
    """Remove the USER env var and assert OSError is raised.""
    monkeypatch.delenv("USER", raising=False)

    with pytest.raises(OSError):
        _ = get_os_user_lower()
```

This behavior can be moved into fixture structures and shared across tests:

```python
# contents of our test file e.g. test_code.py
import pytest

@pytest.fixture
def mock_env_user(monkeypatch):
    monkeypatch.setenv("USER", "TestingUser")

@pytest.fixture
def mock_env_missing(monkeypatch):
    monkeypatch.delenv("USER", raising=False)

# notice the tests reference the fixtures for mocks
def test_upper_to_lower(mock_env_user):
    assert get_os_user_lower() == "testinguser"

def test_raise_exception(mock_env_missing):
    with pytest.raises(OSError):
        _ = get_os_user_lower()
```

### 2.7.5 Monkeypatching dictionaries

monkeypatch.setitem can be used to safely set the values of dictionaries to specific values during tests. Take this simplified connection string example:

```python
# contents of app.py to generate a simple connection string
DEFAULT_CONFIG = {"user": "user1", "database": "db1"}

def create_connection_string(config=None):
    """Creates a connection string from input or defaults.""
```

(continues on next page)
For testing purposes we can patch the DEFAULT_CONFIG dictionary to specific values.

```python
# contents of test_app.py
# app.py with the connection string function (prior code block)
import app

def test_connection(monkeypatch):
    # Patch the values of DEFAULT_CONFIG to specific testing values only for this test.
    monkeypatch.setitem(app.DEFAULT_CONFIG, "user", "test_user")
    monkeypatch.setitem(app.DEFAULT_CONFIG, "database", "test_db")

    # expected result based on the mocks
    expected = "User Id=test_user; Location=test_db;"

    # the test uses the monkeypatched dictionary settings
    result = app.create_connection_string()
    assert result == expected

You can use the monkeypatch.delitem to remove values.

```python
# contents of test_app.py
import pytest

# app.py with the connection string function
import app

def test_missing_user(monkeypatch):
    # patch the DEFAULT_CONFIG to be missing the 'user' key
    monkeypatch.delitem(app.DEFAULT_CONFIG, "user", raising=False)

    # Key error expected because a config is not passed, and the default is now missing the 'user' entry.
    with pytest.raises(KeyError):
        _ = app.create_connection_string()
```

The modularity of fixtures gives you the flexibility to define separate fixtures for each potential mock and reference them in the needed tests.

```python
# contents of test_app.py
import pytest

# app.py with the connection string function
import app

# all of the mocks are moved into separated fixtures
@pytest.fixture
def mock_test_user(monkeypatch):
    """Set the DEFAULT_CONFIG user to test_user.""
    monkeypatch.setitem(app.DEFAULT_CONFIG, "user", "test_user")
```
@pytest.fixture
def mock_test_database(monkeypatch):
    """Set the DEFAULT_CONFIG database to test_db.""
    monkeypatch.setitem(app.DEFAULT_CONFIG, "database", "test_db")

@pytest.fixture
def mock_missing_default_user(monkeypatch):
    """Remove the user key from DEFAULT_CONFIG""
    monkeypatch.delitem(app.DEFAULT_CONFIG, "user", raising=False)

# tests reference only the fixture mocks that are needed
def test_connection(mock_test_user, mock_test_database):
    expected = "User Id=test_user; Location=test_db;"
    result = app.create_connection_string()
    assert result == expected

def test_missing_user(mock_missing_default_user):
    with pytest.raises(KeyError):
        _ = app.create_connection_string()

2.7.6 API Reference

Consult the docs for the MonkeyPatch class.

2.8 How to run doctests

By default, all files matching the test*.txt pattern will be run through the python standard doctest module. You can change the pattern by issuing:

    pytest --doctest-glob="*.rst"

on the command line. --doctest-glob can be given multiple times in the command-line.

If you then have a text file like this:

    # content of test_example.txt
    hello this is a doctest
    >>> x = 3
    >>> x
    3

then you can just invoke pytest directly:

    $ pytest
    ============================ test session starts ============================
    platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
    rootdir: /home/sweet/project
By default, pytest will collect test*.txt files looking for doctest directives, but you can pass additional globs using the --doctest-glob option (multi-allowed).

In addition to text files, you can also execute doctests directly from docstrings of your classes and functions, including from test modules:

```python
# content of mymodule.py

def something():
    """a doctest in a docstring
    >>> something()
    42
    ""
    return 42
```

You can make these changes permanent in your project by putting them into a pytest.ini file like this:

```ini
# content of pytest.ini
[pytest]
addopts = --doctest-modules
```

### 2.8.1 Encoding

The default encoding is **UTF-8**, but you can specify the encoding that will be used for those doctest files using the doctest_encoding ini option:

```ini
# content of pytest.ini
[pytest]
doctest_encoding = latin1
```
2.8.2 Using ‘doctest’ options

Python’s standard doctest module provides some options to configure the strictness of doctest tests. In pytest, you can enable those flags using the configuration file.

For example, to make pytest ignore trailing whitespaces and ignore lengthy exception stack traces you can just write:

```yaml
[pytest]
doctest_optionflags = NORMALIZE_WHITESPACE IGNORE_EXCEPTION_DETAIL
```

Alternatively, options can be enabled by an inline comment in the doc test itself:

```python
>>> something_that_raises()  # doctest: +IGNORE_EXCEPTION_DETAIL
Traceback (most recent call last):
ValueError: ...
```

pytest also introduces new options:

- **ALLOW_UNICODE**: when enabled, the u prefix is stripped from unicode strings in expected doctest output. This allows doctests to run in Python 2 and Python 3 unchanged.

- **ALLOW_BYTES**: similarly, the b prefix is stripped from byte strings in expected doctest output.

- **NUMBER**: when enabled, floating-point numbers only need to match as far as the precision you have written in the expected doctest output. The numbers are compared using `pytest.approx()` with relative tolerance equal to the precision. For example, the following output would only need to match to 2 decimal places when comparing 3.14 to `pytest.approx(math.pi, rel=10**-2)`:

```python
>>> math.pi
3.14
```

If you wrote 3.1416 then the actual output would need to match to approximately 4 decimal places; and so on.

This avoids false positives caused by limited floating-point precision, like this:

```text
Expected:
  0.233
Got:
  0.23300000000000001
```

NUMBER also supports lists of floating-point numbers – in fact, it matches floating-point numbers appearing anywhere in the output, even inside a string! This means that it may not be appropriate to enable globally in `doctest_optionflags` in your configuration file.

Added in version 5.1.

2.8.3 Continue on failure

By default, pytest would report only the first failure for a given doctest. If you want to continue the test even when you have failures, do:

```bash
pytest --doctest-modules --doctest-continue-on-failure
```
2.8.4 Output format

You can change the diff output format on failure for your doctests by using one of standard doctest modules format in options (see `doctest.REPORT_UDIFF`, `doctest.REPORT_CDIFF`, `doctest.REPORT_NDIFF`, `doctest.REPORT_ONLY_FIRST_FAILURE`):

```bash
pytest --doctest-modules --doctest-report none
pytest --doctest-modules --doctest-report udiff
pytest --doctest-modules --doctest-report cdiff
pytest --doctest-modules --doctest-report ndiff
pytest --doctest-modules --doctest-report only_first_failure
```

2.8.5 pytest-specific features

Some features are provided to make writing doctests easier or with better integration with your existing test suite. Keep in mind however that by using those features you will make your doctests incompatible with the standard `doctests` module.

**Using fixtures**

It is possible to use fixtures using the `getfixture` helper:

```python
# content of example.rst
>>> tmp = getfixture('tmp_path')
>>> ...
```

Note that the fixture needs to be defined in a place visible by pytest, for example, a `conftest.py` file or plugin; normal python files containing docstrings are not normally scanned for fixtures unless explicitly configured by `python_files`.

Also, the `usefixtures` mark and fixtures marked as `autouse` are supported when executing text doctest files.

**`doctest_namespace` fixture**

The `doctest_namespace` fixture can be used to inject items into the namespace in which your doctests run. It is intended to be used within your own fixtures to provide the tests that use them with context.

`doctest_namespace` is a standard `dict` object into which you place the objects you want to appear in the doctest namespace:

```python
# content of conftest.py
import pytest
import numpy

@pytest.fixture(autouse=True)
def add_np(doctest_namespace):
    doctest_namespace["np"] = numpy
```

which can then be used in your doctests directly:
# content of numpy.py

def arange():
    
    >>> a = np.arange(10)
    >>> len(a)
    10
    
Note that like the normal conftest.py, the fixtures are discovered in the directory tree conftest is in. Meaning that if you put your doctest with your source code, the relevant conftest.py needs to be in the same directory tree. Fixtures will not be discovered in a sibling directory tree!

## Skipping tests

For the same reasons one might want to skip normal tests, it is also possible to skip tests inside doctests.

To skip a single check inside a doctest you can use the standard `doctest.SKIP` directive:

```python
def test_random(y):
    
    >>> random.random() # doctest: +SKIP
    0.156231223

    >>> 1 + 1
    2
    
```

This will skip the first check, but not the second.

pytest also allows using the standard pytest functions `pytest.skip()` and `pytest.xfail()` inside doctests, which might be useful because you can then skip/xfail tests based on external conditions:

```python
>>> import sys, pytest
>>> if sys.platform.startswith('win'):
...     pytest.skip('this doctest does not work on Windows')
...
>>> import fcntl
>>> ...
```

However using those functions is discouraged because it reduces the readability of the docstring.

**Note:** `pytest.skip()` and `pytest.xfail()` behave differently depending if the doctests are in a Python file (in docstrings) or a text file containing doctests intermingled with text:

- Python modules (docstrings): the functions only act in that specific docstring, letting the other docstrings in the same module execute as normal.
- Text files: the functions will skip/xfail the checks for the rest of the entire file.
2.8.6 Alternatives

While the built-in pytest support provides a good set of functionalities for using doctests, if you use them extensively you might be interested in those external packages which add many more features, and include pytest integration:

- pytest-doctestplus: provides advanced doctest support and enables the testing of reStructuredText (.rst) files.
- Sybil: provides a way to test examples in your documentation by parsing them from the documentation source and evaluating the parsed examples as part of your normal test run.

2.9 How to re-run failed tests and maintain state between test runs

2.9.1 Usage

The plugin provides two command line options to rerun failures from the last pytest invocation:

- `--lf, --last-failed` - to only re-run the failures.
- `--ff, --failed-first` - to run the failures first and then the rest of the tests.

For cleanup (usually not needed), a `--cache-clear` option allows to remove all cross-session cache contents ahead of a test run.

Other plugins may access the `config.cache` object to set/get json encodable values between pytest invocations.

Note: This plugin is enabled by default, but can be disabled if needed: see Deactivating / unregistering a plugin by name (the internal name for this plugin is cacheprovider).

2.9.2 Rerunning only failures or failures first

First, let's create 50 test invocation of which only 2 fail:

```python
# content of test_50.py
import pytest

@pytest.mark.parametrize("i", range(50))
def test_num(i):
    if i in (17, 25):
        pytest.fail("bad luck")
```

If you run this for the first time you will see two failures:

```
$ pytest -q
.................F............F.................. [100%]
================================================================== Failures==================================================================
_______________________________ test_num[17] _______________________________
i = 17
@pytest.mark.parametrize("i", range(50))
def test_num(i):
    if i in (17, 25):
```

(continues on next page)
> pytest.fail("bad luck")
E Failed: bad luck

test_50.py:7: Failed

@ pytest.mark.parametrize("i", range(50))
def test_num(i):
    if i in (17, 25):
> pytest.fail("bad luck")
E Failed: bad luck
	est_50.py:7: Failed

If you then run it with --lf:

$ pytest --lf

---
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items
run-last-failure: rerun previous 2 failures
test_50.py FF [100%]

---
FAILURES

---

test_50.py::test_num[17] - Failed: bad luck
test_50.py::test_num[25] - Failed: bad luck

2 failed, 48 passed in 0.12s

2.9. How to re-run failed tests and maintain state between test runs
You have run only the two failing tests from the last run, while the 48 passing tests have not been run (“deselected”).

Now, if you run with the --ff option, all tests will be run but the first previous failures will be executed first (as can be seen from the series of FF and dots):

```
$ pytest --ff
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 50 items
run-last-failure: rerun previous 2 failures first
test_50.py FF................................................ [100%]

================================ FAILURES =============================
_________________________________ test_num[17] _______________________

    i = 17

    @pytest.mark.parametrize("i", range(50))
    def test_num(i):
        if i in (17, 25):
            pytest.fail("bad luck")

E Failed: bad luck
test_50.py:7: Failed

_________________________________ test_num[25] _______________________

    i = 25

    @pytest.mark.parametrize("i", range(50))
    def test_num(i):
        if i in (17, 25):
            pytest.fail("bad luck")

E Failed: bad luck
test_50.py:7: Failed
```

New --nf, --new-first options: run new tests first followed by the rest of the tests, in both cases tests are also sorted by the file modified time, with more recent files coming first.
2.9.3 Behavior when no tests failed in the last run

The `--lfnf/--last-failed-no-failures` option governs the behavior of `--last-failed`. Determines whether to execute tests when there are no previously (known) failures or when no cached `lastfailed` data was found.

There are two options:

- `all`: when there are no known test failures, runs all tests (the full test suite). This is the default.
- `none`: when there are no known test failures, just emits a message stating this and exit successfully.

Example:

```
pytest --last-failed --last-failed-no-failures all    # runs the full test suite...  
                        → (default behavior)
pytest --last-failed --last-failed-no-failures none   # runs no tests and exits...   
                        → successfully
```

2.9.4 The new config.cache object

Plugins or conftest.py support code can get a cached value using the pytest `config` object. Here is a basic example plugin which implements a `fixture` which re-uses previously created state across pytest invocations:

```python
# content of test_caching.py
import pytest

def expensive_computation():
    print("running expensive computation...")

@pytest.fixture
def mydata(pytestconfig):
    val = pytestconfig.cache.get("example/value", None)
    if val is None:
        expensive_computation()
        val = 42
        pytestconfig.cache.set("example/value", val)
    return val

def test_function(mydata):
    assert mydata == 23
```

If you run this command for the first time, you can see the print statement:

```
$ pytest -q
F
============================================================================ FAILURES =============================================================================
______________________________ test_function _______________________________
mydata = 42

def test_function(mydata):
    assert mydata == 23
E    assert 42 == 23
```

(continues on next page)
If you run it a second time, the value will be retrieved from the cache and nothing will be printed:

```bash
$ pytest -q
F [100%]

mydata = 42

def test_function(mydata):
    assert mydata == 23
E assert 42 == 23
```

See the `config.cache fixture` for more details.

### 2.9.5 Inspecting Cache content

You can always peek at the content of the cache using the `--cache-show` command line option:

```bash
$ pytest --cache-show
```

```bash
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
cachedir: /home/sweet/project/.pytest_cache
--------------------------- cache values for '*' ---------------------------
cache/lastfailed contains:
    {'test_caching.py::test_function': True}
cache/nodeids contains:
    ['test_caching.py::test_function']
cache/stepwise contains:
    []
example/value contains:
    42
```

`--cache-show` takes an optional argument to specify a glob pattern for filtering:

```bash
$ pytest --cache-show example/*
```

```bash
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
cachedir: /home/sweet/project/.pytest_cache
```
--- cache values for 'example/*' ---

example/value contains:

42

--- no tests ran in 0.12s ---

2.9.6 Clearing Cache content

You can instruct pytest to clear all cache files and values by adding the --cache-clear option like this:

```
pytest --cache-clear
```

This is recommended for invocations from Continuous Integration servers where isolation and correctness is more important than speed.

2.9.7 Stepwise

As an alternative to --lf -x, especially for cases where you expect a large part of the test suite will fail, --sw, --stepwise allows you to fix them one at a time. The test suite will run until the first failure and then stop. At the next invocation, tests will continue from the last failing test and then run until the next failing test. You may use the --stepwise-skip option to ignore one failing test and stop the test execution on the second failing test instead. This is useful if you get stuck on a failing test and just want to ignore it until later. Providing --stepwise-skip will also enable --stepwise implicitly.

2.10 How to manage logging

pytest captures log messages of level WARNING or above automatically and displays them in their own section for each failed test in the same manner as captured stdout and stderr.

Running without options:

```
pytest
```

Shows failed tests like so:

--- Captured stdlog call ---

test_reporting.py 26 WARNING text going to logger
--- Captured stdout call ---

text going to stdout
--- Captured stderr call ---

text going to stderr

--- 2 failed in 0.02 seconds ---

By default each captured log message shows the module, line number, log level and message.

If desired the log and date format can be specified to anything that the logging module supports by passing specific formatting options:

```
pytest --log-format="%(asctime)s %(levelname)s %(message)s" \  
--log-date-format="%Y-%m-%d %H:%M:%S"
```

Shows failed tests like so:
These options can also be customized through `pytest.ini` file:

```ini
[pys
test]
log_format = %(asctime)s %(levelname)s %(message)s
log_date_format = %Y-%m-%d %H:%M:%S
```

Specific loggers can be disabled via `--log-disable={logger_name}`. This argument can be passed multiple times:

```
pytest --log-disable=main --log-disable=testing
```

Further it is possible to disable reporting of captured content (stdout, stderr and logs) on failed tests completely with:

```
pytest --show-capture=no
```

### 2.10.1 caplog fixture

Inside tests it is possible to change the log level for the captured log messages. This is supported by the `caplog` fixture:

```python
def test_foo(caplog):
    caplog.set_level(logging.INFO)
```

By default the level is set on the root logger, however as a convenience it is also possible to set the log level of any logger:

```python
def test_foo(caplog):
    caplog.set_level(logging.CRITICAL, logger="root.baz")
```

The log levels set are restored automatically at the end of the test.

It is also possible to use a context manager to temporarily change the log level inside a `with` block:

```python
def test_bar(caplog):
    with caplog.at_level(logging.INFO):
        pass
```

Again, by default the level of the root logger is affected but the level of any logger can be changed instead with:

```python
def test_bar(caplog):
    with caplog.at_level(logging.CRITICAL, logger="root.baz"):
        pass
```

Lastly all the logs sent to the logger during the test run are made available on the fixture in the form of both the `logging.LogRecord` instances and the final log text. This is useful for when you want to assert on the contents of a message:

```python
def test_baz(caplog):
    func_under_test()
    for record in caplog.records:
        (continues on next page)
For all the available attributes of the log records see the `logging.LogRecord` class.

You can also resort to `record_tuples` if all you want to do is to ensure, that certain messages have been logged under a given logger name with a given severity and message:

```python
def test_foo(caplog):
    logging.getLogger().info("boo $s", "arg")
    assert caplog.record_tuples == [("root", logging.INFO, "boo arg")]
```

You can call `caplog.clear()` to reset the captured log records in a test:

```python
def test_something_with_clearing_records(caplog):
    some_method_that_creates_log_records()
    caplog.clear()
    your_test_method()
    assert ["Foo"] == [rec.message for rec in caplog.records]
```

The `caplog.records` attribute contains records from the current stage only, so inside the setup phase it contains only setup logs, same with the call and teardown phases.

To access logs from other stages, use the `caplog.get_records(when)` method. As an example, if you want to make sure that tests which use a certain fixture never log any warnings, you can inspect the records for the setup and call stages during teardown like so:

```python
@pytest.fixture
def window(caplog):
    window = create_window()
    yield window
    for when in ("setup", "call"):
        messages = [
            x.message for x in caplog.get_records(when) if x.levelno == logging.WARNING
            ]
        if messages:
            pytest.fail(f"warning messages encountered during testing: {messages}"")
```

The full API is available at `pytest.LogCaptureFixture`.

**Warning:** The `caplog` fixture adds a handler to the root logger to capture logs. If the root logger is modified during a test, for example with `logging.config.dictConfig`, this handler may be removed and cause no logs to be captured. To avoid this, ensure that any root logger configuration only adds to the existing handlers.
2.10.2 Live Logs

By setting the `log_cli` configuration option to `true`, pytest will output logging records as they are emitted directly into the console.

You can specify the logging level for which log records with equal or higher level are printed to the console by passing `--log-cli-level`. This setting accepts the logging level names or numeric values as seen in logging’s documentation.

Additionally, you can also specify `--log-cli-format` and `--log-cli-date-format` which mirror and default to `--log-format` and `--log-date-format` if not provided, but are applied only to the console logging handler.

All of the CLI log options can also be set in the configuration INI file. The option names are:

- `log_cli_level`
- `log_cli_format`
- `log_cli_date_format`

If you need to record the whole test suite logging calls to a file, you can pass `--log-file=/path/to/log/file`. This log file is opened in write mode by default which means that it will be overwritten at each run tests session. If you’d like the file opened in append mode instead, then you can pass `--log-file-mode=a`. Note that relative paths for the log-file location, whether passed on the CLI or declared in a config file, are always resolved relative to the current working directory.

You can also specify the logging level for the log file by passing `--log-file-level`. This setting accepts the logging level names or numeric values as seen in logging’s documentation.

Additionally, you can also specify `--log-file-format` and `--log-file-date-format` which are equal to `--log-format` and `--log-date-format` but are applied to the log file logging handler.

All of the log file options can also be set in the configuration INI file. The option names are:

- `log_file`
- `log_file_mode`
- `log_file_level`
- `log_file_format`
- `log_file_date_format`

You can call `set_log_path()` to customize the log_file path dynamically. This functionality is considered experimental. Note that `set_log_path()` respects the `log_file_mode` option.

2.10.3 Customizing Colors

Log levels are colored if colored terminal output is enabled. Changing from default colors or putting color on custom log levels is supported through `add_color_level()`. Example:

```python
@pytest.hookimpl(trylast=True)
def pytest_configure(config):
    logging_plugin = config.pluginmanager.get_plugin("logging-plugin")

    # Change color on existing log level
    logging_plugin.log_cli_handler.formatter.add_color_level(logging.INFO, "cyan")

    # Add color to a custom log level (a custom log level `SPAM` is already set up)
    logging_plugin.log_cli_handler.formatter.add_color_level(logging.SPAM, "blue")
```
2.10.4 Release notes

This feature was introduced as a drop-in replacement for the pytest-catchlog plugin and they conflict with each other. The backward compatibility API with pytest-capturelog has been dropped when this feature was introduced, so if for that reason you still need pytest-catchlog you can disable the internal feature by adding to your pytest.ini:

```ini
[pytest]
addopts=-p no:logging
```

2.10.5 Incompatible changes in pytest 3.4

This feature was introduced in 3.3 and some incompatible changes have been made in 3.4 after community feedback:

- Log levels are no longer changed unless explicitly requested by the `log_level` configuration or `--log-level` command-line options. This allows users to configure logger objects themselves. Setting `log_level` will set the level that is captured globally so if a specific test requires a lower level than this, use the `caplog.set_level()` functionality otherwise that test will be prone to failure.

- **Live Logs** is now disabled by default and can be enabled setting the `log_cli` configuration option to `true`. When enabled, the verbosity is increased so logging for each test is visible.

- **Live Logs** are now sent to `sys.stdout` and no longer require the `-s` command-line option to work.

If you want to partially restore the logging behavior of version 3.3, you can add this options to your ini file:

```ini
[pytest]
log_cli=true
log_level=NOTSET
```

More details about the discussion that lead to this changes can be read in [#3013](https://github.com/pytest-dev/pytest/issues/3013).

2.11 How to capture stdout/stderr output

2.11.1 Default stdout/stderr/stdin capturing behaviour

During test execution any output sent to `stdout` and `stderr` is captured. If a test or a setup method fails its according captured output will usually be shown along with the failure traceback. (this behavior can be configured by the `--show-capture` command-line option).

In addition, `stdin` is set to a “null” object which will fail on attempts to read from it because it is rarely desired to wait for interactive input when running automated tests.

By default capturing is done by intercepting writes to low level file descriptors. This allows to capture output from simple print statements as well as output from a subprocess started by a test.
2.11.2 Setting capturing methods or disabling capturing

There are three ways in which pytest can perform capturing:

- **fd** (file descriptor) level capturing (default): All writes going to the operating system file descriptors 1 and 2 will be captured.
- **sys** level capturing: Only writes to Python files `sys.stdout` and `sys.stderr` will be captured. No capturing of writes to file descriptors is performed.
- **tee-sys** capturing: Python writes to `sys.stdout` and `sys.stderr` will be captured, however the writes will also be passed-through to the actual `sys.stdout` and `sys.stderr`. This allows output to be ‘live printed’ and captured for plugin use, such as junitxml (new in pytest 5.4).

You can influence output capturing mechanisms from the command line:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pytest -s</td>
<td># disable all capturing</td>
</tr>
<tr>
<td>pytest --capture=sys</td>
<td># replace sys.stdout/stderr with in-mem files</td>
</tr>
<tr>
<td>pytest --capture=fd</td>
<td># also point filedescriptors 1 and 2 to temp file</td>
</tr>
<tr>
<td>pytest --capture=tee-sys</td>
<td># combines 'sys' and '-s', capturing sys.stdout/stderr</td>
</tr>
<tr>
<td></td>
<td># and passing it along to the actual sys.stdout/stderr</td>
</tr>
</tbody>
</table>

2.11.3 Using print statements for debugging

One primary benefit of the default capturing of stdout/stderr output is that you can use print statements for debugging:

```python
# content of test_module.py

def setup_function(function):
    print("setting up", function)

def test_func1():
    assert True

def test_func2():
    assert False
```

and running this module will show you precisely the output of the failing function and hide the other one:

```
$ pytest
================================= test session starts =================================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items

  test_module.py (.F) [100%]

================================== FAILURES ======================================

__ test_func2 ()
>    assert False
E    assert False

(continues on next page)```
2.11.4 Accessing captured output from a test function

The capsyl, capsysbinary, capfd, and capfdbinary fixtures allow access to stdout/stderr output created during test execution. Here is an example test function that performs some output related checks:

```python
def test_myoutput(capsys):
    # or use "capfd" for fd-level
    print("hello")
sys.stderr.write("world"
)    captured = capsys.readouterr()
    assert captured.out == "hello"
    assert captured.err == "world"
    print("next")
captured = capsys.readouterr()
    assert captured.out == "next"
```

The readouterr() call snapshots the output so far - and capturing will be continued. After the test function finishes the original streams will be restored. Using capsyl this way frees your test from having to care about setting/resetting output streams and also interacts well with pytest's own per-test capturing.

If you want to capture on filedescriptor level you can use the capfd fixture which offers the exact same interface but allows to also capture output from libraries or subprocesses that directly write to operating system level output streams (FD1 and FD2).

The return value from readouterr changed to a namedtuple with two attributes, out and err.

If the code under test writes non-textual data, you can capture this using the capsysbinary fixture which instead returns bytes from the readouterr method.

If the code under test writes non-textual data, you can capture this using the capfdbinary fixture which instead returns bytes from the readouterr method. The capfdbinary fixture operates on the filedescriptor level.

To temporarily disable capture within a test, both capsyl and capfd have a disabled() method that can be used as a context manager, disabling capture inside the with block:

```python
def test_disabling_capturing(capsys):
    print("this output is captured")
    with capsys.disabled():
        print("output not captured, going directly to sys.stdout")
    print("this output is also captured")
```
2.12 How to capture warnings

Starting from version 3.1, pytest now automatically catches warnings during test execution and displays them at the end of the session:

```python
# content of test_show_warnings.py
import warnings

def api_v1():
    warnings.warn(UserWarning("api v1, should use functions from v2"))
    return 1

def test_one():
    assert api_v1() == 1
```

Running pytest now produces this output:

```
$ pytest test_show_warnings.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 1 item
test_show_warnings.py . [100%]
============================= warnings summary =============================
test_show_warnings.py::test_one
/home/sweet/project/test_show_warnings.py:5: UserWarning: api v1, should use...
    warnings.warn(UserWarning("api v1, should use functions from v2"))
======================= 1 passed, 1 warning in 0.12s =======================
```

2.12.1 Controlling warnings

Similar to Python's `warning filter` and `-W` option flag, pytest provides its own `-W` flag to control which warnings are ignored, displayed, or turned into errors. See the `warning filter` documentation for more advanced use-cases.

This code sample shows how to treat any `UserWarning` category class of warning as an error:

```
$ pytest -q test_show_warnings.py -W error::UserWarning
F [100%]
================================== FAILURES =================================
_________________________________ test_one _______________________________
def test_one():
>   assert api_v1() == 1
```

(continues on next page)
pytest Documentation, Release 8.3

(continued from previous page)

```
> warnings.warn(UserWarning("api v1, should use functions from v2"))
E UserWarning: api v1, should use functions from v2

test_show_warnings.py:5: UserWarning
= short test summary info =
FAILED test_show_warnings.py::test_one - UserWarning: api v1, should use ...
1 failed in 0.12s
```

The same option can be set in the `pytest.ini` or `pyproject.toml` file using the `filterwarnings` ini option. For example, the configuration below will ignore all user warnings and specific deprecation warnings matching a regex, but will transform all other warnings into errors.

```ini
# pytest.ini
[pytest]
fILTERWARNINGS =
   error
   ignore::UserWarning
   ignore:function ham(\) is deprecated:DeprecationWarning

# pyproject.toml
[tool.pytest.ini_options]
fILTERWARNINGS =
   "error",
   "ignore::UserWarning",
   'ignore:function ham(\) is deprecated:DeprecationWarning',
```

When a warning matches more than one option in the list, the action for the last matching option is performed.

**Note:** The `-W` flag and the `filterwarnings` ini option use warning filters that are similar in structure, but each configuration option interprets its filter differently. For example, `message` in `filterwarnings` is a string containing a regular expression that the start of the warning message must match, case-insensitively, while `message` in `-W` is a literal string that the start of the warning message must contain (case-insensitively), ignoring any whitespace at the start or end of message. Consult the warning filter documentation for more details.

### 2.12.2 `@pytest.mark.filterwarnings`

You can use the `@pytest.mark.filterwarnings` to add warning filters to specific test items, allowing you to have finer control of which warnings should be captured at test, class or even module level:

```python
import warnings

def api_v1():
   warnings.warn("api v1, should use functions from v2")
   return 1

@pytest.mark.filterwarnings("ignore:api v1")
def test_one():
   assert api_v1() == 1
```

2.12. How to capture warnings
Filters applied using a mark take precedence over filters passed on the command line or configured by the `filter-warnings` ini option.

You may apply a filter to all tests of a class by using the `filterwarnings` mark as a class decorator or to all tests in a module by setting the `pytestmark` variable:

```python
# turns all warnings into errors for this module
pytestmark = pytest.mark.filterwarnings("error")
```

*Credits go to Florian Schulze for the reference implementation in the pytest-warnings plugin.*

2.12.3 Disabling warnings summary

Although not recommended, you can use the `--disable-warnings` command-line option to suppress the warning summary entirely from the test run output.

2.12.4 Disabling warning capture entirely

This plugin is enabled by default but can be disabled entirely in your `pytest.ini` file with:

```
[pytest]
addopts = -p no:warnings
```

Or passing `--disable-warnings` in the command-line. This might be useful if your test suites handles warnings using an external system.

2.12.5 DeprecationWarning and PendingDeprecationWarning

By default pytest will display `DeprecationWarning` and `PendingDeprecationWarning` warnings from user code and third-party libraries, as recommended by PEP 565. This helps users keep their code modern and avoid breakages when deprecated warnings are effectively removed.

However, in the specific case where users capture any type of warnings in their test, either with `pytest.warns()`, `pytest.deprecated_call()` or using the `recwarn` fixture, no warning will be displayed at all.

Sometimes it is useful to hide some specific deprecation warnings that happen in code that you have no control over (such as third-party libraries), in which case you might use the warning filters options (ini or marks) to ignore those warnings.

For example:

```
[pytest]
filterwarnings =
    ignore:.*U.*mode is deprecated:DeprecationWarning
```

This will ignore all warnings of type `DeprecationWarning` where the start of the message matches the regular expression `".*U\.*mode is deprecated"`.

See `@pytest.mark.filterwarnings` and `Controlling warnings` for more examples.

*Note:* If warnings are configured at the interpreter level, using the `PYTHONWARNINGS` environment variable or the `--w` command-line option, pytest will not configure any filters by default.

Also pytest doesn't follow PEP 506 suggestion of resetting all warning filters because it might break test suites that configure warning filters themselves by calling `warnings.simplefilter()` (see #2430 for an example of that).
2.12.6 Ensuring code triggers a deprecation warning

You can also use `pytest.deprecated_call()` for checking that a certain function call triggers a DeprecationWarning or PendingDeprecationWarning:

```python
import pytest

def test_myfunction_deprecated():
    with pytest.deprecated_call():
        myfunction(17)
```

This test will fail if `myfunction` does not issue a deprecation warning when called with a 17 argument.

2.12.7 Asserting warnings with the warns function

You can check that code raises a particular warning using `pytest.warns()`, which works in a similar manner to `raises` (except that `raises` does not capture all exceptions, only the `expected_exception`):

```python
import warnings
import pytest

def test_warning():
    with pytest.warns(UserWarning):
        warnings.warn("my warning", UserWarning)
```

The test will fail if the warning in question is not raised. Use the keyword argument `match` to assert that the warning matches a text or regex. To match a literal string that may contain regular expression metacharacters like `(` or `)`, the pattern can first be escaped with `re.escape`.

Some examples:

```python
>>> with warns(UserWarning, match="must be 0 or None"):
...     warnings.warn("value must be 0 or None", UserWarning)
... 
... Traceback (most recent call last):
... Failed: DID NOT WARN. No warnings of type ...UserWarning... were emitted...

>>> with warns(UserWarning, match=r"must be \d+$"):
...     warnings.warn("value must be 42", UserWarning)
...

>>> with warns(UserWarning, match=r"must be \d+$"):
...     warnings.warn("this is not here", UserWarning)
...

You can also call `pytest.warns()` on a function or code string:

```python
pytest.warns(expected_warning, func, *args, **kwargs)
pytest.warns(expected_warning, "func(*args, **kwargs)"
```

2.12. How to capture warnings
The function also returns a list of all raised warnings (as \texttt{warnings.WarningMessage} objects), which you can query for additional information:

```python
with pytest.warns(RuntimeWarning) as record:
    warnings.warn("another warning", RuntimeWarning)

# check that only one warning was raised
assert len(record) == 1
# check that the message matches
assert record[0].message.args[0] == "another warning"
```

Alternatively, you can examine raised warnings in detail using the \texttt{recwarn} fixture (see below).

The \texttt{recwarn} fixture automatically ensures to reset the warnings filter at the end of the test, so no global state is leaked.

### 2.12.8 Recording warnings

You can record raised warnings either using \texttt{pytest.warns()} or with the \texttt{recwarn} fixture.

To record with \texttt{pytest.warns()} without asserting anything about the warnings, pass no arguments as the expected warning type and it will default to a generic Warning:

```python
with pytest.warns() as record:
    warnings.warn("user", UserWarning)
    warnings.warn("runtime", RuntimeWarning)

assert len(record) == 2
assert str(record[0].message) == "user"
assert str(record[1].message) == "runtime"
```

The \texttt{recwarn} fixture will record warnings for the whole function:

```python
import warnings

def test_hello(recwarn):
    warnings.warn("hello", UserWarning)
    assert len(recwarn) == 1
    w = recwarn.pop(UserWarning)
    assert issubclass(w.category, UserWarning)
    assert str(w.message) == "hello"
    assert w.filename
    assert w.lineno
```

Both \texttt{recwarn} and \texttt{pytest.warns()} return the same interface for recorded warnings: a \texttt{WarningsRecorder} instance. To view the recorded warnings, you can iterate over this instance, call \texttt{len} on it to get the number of recorded warnings, or index into it to get a particular recorded warning.

Full API: \texttt{WarningsRecorder}.  

2.12.9 Additional use cases of warnings in tests

Here are some use cases involving warnings that often come up in tests, and suggestions on how to deal with them:

- To ensure that **at least one** of the indicated warnings is issued, use:

  ```python
def test_warning():
      with pytest.warns((RuntimeWarning, UserWarning)):
          ...
  ```

- To ensure that **only** certain warnings are issued, use:

  ```python
def test_warning(recwarn):
      ...
      assert len(recwarn) == 1
      user_warning = recwarn.pop(UserWarning)
      assert issubclass(user_warning.category, UserWarning)
  ```

- To ensure that **no** warnings are emitted, use:

  ```python
def test_warning():
      with warnings.catch_warnings():
          warnings.simplefilter("error")
          ...
  ```

- To suppress warnings, use:

  ```python
with warnings.catch_warnings():
    warnings.simplefilter("ignore")
    ...
  ```

2.12.10 Custom failure messages

Recording warnings provides an opportunity to produce custom test failure messages for when no warnings are issued or other conditions are met.

```python
def test():
    with pytest.warns(Warning) as record:
        f()
        if not record:
            pytest.fail("Expected a warning!")
```

If no warnings are issued when calling `f`, then `not record` will evaluate to `True`. You can then call `pytest.fail()` with a custom error message.

2.12.11 Internal pytest warnings

pytest may generate its own warnings in some situations, such as improper usage or deprecated features.

For example, pytest will emit a warning if it encounters a class that matches `python_classes` but also defines an `__init__` constructor, as this prevents the class from being instantiated:

```python
# content of test_pytest_warnings.py
class Test:
    def __init__(self):
```

(continues on next page)
pass

def test_foo(self):
    assert 1 == 1

$ pytest test_pytest_warnings.py -q

==================================================================== warnings summary ========

1 warning in 0.12s

These warnings might be filtered using the same built-in mechanisms used to filter other types of warnings.

Please read our Backwards Compatibility Policy to learn how we proceed about deprecating and eventually removing features.

The full list of warnings is listed in the reference documentation.

2.12.12 Resource Warnings

Additional information of the source of a ResourceWarning can be obtained when captured by pytest if trace-malloc module is enabled.

One convenient way to enable tracemalloc when running tests is to set the PYTHONTRACEMALLOC to a large enough number of frames (say 20, but that number is application dependent).

For more information, consult the Python Development Mode section in the Python documentation.

2.13 How to use skip and xfail to deal with tests that cannot succeed

You can mark test functions that cannot be run on certain platforms or that you expect to fail so pytest can deal with them accordingly and present a summary of the test session, while keeping the test suite green.

A skip means that you expect your test to pass only if some conditions are met, otherwise pytest should skip running the test altogether. Common examples are skipping windows-only tests on non-windows platforms, or skipping tests that depend on an external resource which is not available at the moment (for example a database).

An xfail means that you expect a test to fail for some reason. A common example is a test for a feature not yet implemented, or a bug not yet fixed. When a test passes despite being expected to fail (marked with pytest.mark.xfail), it’s an xpass and will be reported in the test summary.

pytest counts and lists skip and xfail tests separately. Detailed information about skipped/xfailed tests is not shown by default to avoid cluttering the output. You can use the -r option to see details corresponding to the “short” letters shown in the test progress:

pytest -rxXs  # show extra info on xfailed, xpassed, and skipped tests

More details on the -r option can be found by running pytest -h.
2.13.1 Skipping test functions

The simplest way to skip a test function is to mark it with the `skip` decorator which may be passed an optional `reason`:

```python
@pytest.mark.skip(reason="no way of currently testing this")
def test_the_unknown(): ...
```

Alternatively, it is also possible to skip imperatively during test execution or setup by calling the `pytest.skip(reason)` function:

```python
def test_function():
    if not valid_config():
        pytest.skip("unsupported configuration")
```

The imperative method is useful when it is not possible to evaluate the skip condition during import time.

It is also possible to skip the whole module using `pytest.skip(reason, allow_module_level=True)` at the module level:

```python
import sys
import pytest
if not sys.platform.startswith("win"):
    pytest.skip("skipping windows-only tests", allow_module_level=True)
```

Reference: `pytest.mark.skip`  

`skipif`

If you wish to skip something conditionally then you can use `skipif` instead. Here is an example of marking a test function to be skipped when run on an interpreter earlier than Python3.10:

```python
import sys

@ pytest.mark.skipif(sys.version_info < (3, 10), reason="requires python3.10 or higher ...")
def test_function(): ...
```

If the condition evaluates to `True` during collection, the test function will be skipped, with the specified reason appearing in the summary when using `-rs`.

You can share `skipif` markers between modules. Consider this test module:

```python
# content of test_mymodule.py
import mymodule
minversion = pytest.mark.skipif(
    mymodule.__versioninfo__ < (1, 1), reason="at least mymodule-1.1 required"
)
```

(continues on next page)
You can import the marker and reuse it in another test module:

```python
# test_myothermodule.py
from test_mymodule import minversion

@minversion
def test_anotherfunction(): ...  
```

For larger test suites it's usually a good idea to have one file where you define the markers which you then consistently apply throughout your test suite.

Alternatively, you can use condition strings instead of booleans, but they can't be shared between modules easily so they are supported mainly for backward compatibility reasons.

**Reference**: `pytest.mark.skipif`

### Skip all test functions of a class or module

You can use the `skipif` marker (as any other marker) on classes:

```python
@pytest.mark.skipif(sys.platform == "win32", reason="does not run on windows")
class TestPosixCalls:
    def test_function(self):
        """will not be setup or run under 'win32' platform""
```

If the condition is `True`, this marker will produce a skip result for each of the test methods of that class.

If you want to skip all test functions of a module, you may use the `pytestmark` global:

```python
# test_module.py
pytestmark = pytest.mark.skipif(...)  
```

If multiple `skipif` decorators are applied to a test function, it will be skipped if any of the skip conditions is true.

### Skipping files or directories

Sometimes you may need to skip an entire file or directory, for example if the tests rely on Python version-specific features or contain code that you do not wish pytest to run. In this case, you must exclude the files and directories from collection. Refer to *Customizing test collection* for more information.

### Skipping on a missing import dependency

You can skip tests on a missing import by using `pytest.importorskip` at module level, within a test, or test setup function.

```python
docutils = pytest.importorskip("docutils")
```

If `docutils` cannot be imported here, this will lead to a skip outcome of the test. You can also skip based on the version number of a library:
Summary

Here's a quick guide on how to skip tests in a module in different situations:

1. Skip all tests in a module unconditionally:
   ```python
   pytestmark = pytest.mark.skip("all tests still WIP")
   ```

2. Skip all tests in a module based on some condition:
   ```python
   pytestmark = pytest.mark.skipif(sys.platform == "win32", reason="tests for linux only")
   ```

3. Skip all tests in a module if some import is missing:
   ```python
   pexpect = pytest.importorskip("pexpect")
   ```

2.13.2 XFail: mark test functions as expected to fail

You can use the xfail marker to indicate that you expect a test to fail:

```python
@pytest.mark.xfail
def test_function(): ...
```

This test will run but no traceback will be reported when it fails. Instead, terminal reporting will list it in the "expected to fail" (XFAIL) or “unexpectedly passing” (XPASS) sections.

Alternatively, you can also mark a test as XFAIL from within the test or its setup function imperatively:

```python
def test_function():
    if not valid_config():
        pytest.xfail("failing configuration (but should work)")
```

```python
def test_function2():
    import slow_module
    if slow_module.slow_function():
        pytest.xfail("slow_module taking too long")
```

These two examples illustrate situations where you don’t want to check for a condition at the module level, which is when a condition would otherwise be evaluated for marks.

This will make test_function XFAIL. Note that no other code is executed after the `pytest.xfail()` call, differently from the marker. That’s because it is implemented internally by raising a known exception.

Reference: `pytest.mark.xfail`
condition parameter

If a test is only expected to fail under a certain condition, you can pass that condition as the first parameter:

```python
@pytest.mark.xfail(sys.platform == "win32", reason="bug in a 3rd party library")
def test_function(): ...
```

Note that you have to pass a reason as well (see the parameter description at `pytest.mark.xfail`).

reason parameter

You can specify the motive of an expected failure with the reason parameter:

```python
@ pytest.mark.xfail(reason="known parser issue")
def test_function(): ...
```

raises parameter

If you want to be more specific as to why the test is failing, you can specify a single exception, or a tuple of exceptions, in the raises argument.

```python
@ pytest.mark.xfail(raises=RuntimeError)
def test_function(): ...
```

Then the test will be reported as a regular failure if it fails with an exception not mentioned in raises.

run parameter

If a test should be marked as xfail and reported as such but should not be even executed, use the run parameter as False:

```python
@ pytest.mark.xfail(run=False)
def test_function(): ...
```

This is specially useful for xfailing tests that are crashing the interpreter and should be investigated later.

strict parameter

Both XFAIL and XPASS don't fail the test suite by default. You can change this by setting the strict keyword-only parameter to True:

```python
@ pytest.mark.xfail(strict=True)
def test_function(): ...
```

This will make XPASS (“unexpectedly passing”) results from this test to fail the test suite.

You can change the default value of the strict parameter using the xfail_strict ini option:
Ignoring xfail

By specifying on the commandline:

```
pytest --runxfail
```

you can force the running and reporting of an `xfail` marked test as if it weren't marked at all. This also causes `pytest.xfail()` to produce no effect.

Examples

Here is a simple test file with the several usages:

```python
from __future__ import annotations
import pytest

xfail = pytest.mark.xfail

@xfail
def test_hello():
    assert 0

@xfail(run=False)
def test_hello2():
    assert 0

@xfail("hasattr(os, 'sep')")
def test_hello3():
    assert 0

@xfail(reason="bug 110")
def test_hello4():
    assert 0

@xfail('pytest.__version__[0] != "17"')
def test_hello5():
    assert 0

def test_hello6():
    pytest.xfail("reason")

@xfail(raises=IndexError)
def test_hello7():
    x = []
    x[1] = 1
```

Running it with the report-on-xfail option gives this output:
2.13.3 Skip/xfail with parametrize

It is possible to apply markers like skip and xfail to individual test instances when using parametrize:

```python
import sys
import pytest

@pytest.mark.parametrize("n", "expected"),
[  
    (1, 2),
    pytest.param(1, 0, marks=pytest.mark.xfail),
    pytest.param(1, 3, marks=pytest.mark.xfail(reason="some bug")),
    (2, 3),
    (3, 4),
    (4, 5),
    pytest.param(10, 11, marks=pytest.mark.skipif(sys.version_info >= (3, 0), reason="py2k")),
],
)

def test_increment(n, expected):
    assert n + 1 == expected
```
2.14 How to install and use plugins

This section talks about installing and using third party plugins. For writing your own plugins, please refer to Writing plugins.

Installing a third party plugin can be easily done with pip:

```bash
pip install pytest-NAME
pip uninstall pytest-NAME
```

If a plugin is installed, pytest automatically finds and integrates it, there is no need to activate it.

Here is a little annotated list for some popular plugins:

- `pytest-django`: write tests for django apps, using pytest integration.
- `pytest-twisted`: write tests for twisted apps, starting a reactor and processing deferreds from test functions.
- `pytest-cov`: coverage reporting, compatible with distributed testing
- `pytest-xdist`: to distribute tests to CPUs and remote hosts, to run in boxed mode which allows to survive segmentation faults, to run in looponfailing mode, automatically re-running failing tests on file changes.
- `pytest-instafail`: to report failures while the test run is happening.
- `pytest-bdd`: to write tests using behaviour-driven testing.
- `pytest-timeout`: to timeout tests based on function marks or global definitions.
- `pytest-pep8`: a `--pep8` option to enable PEP8 compliance checking.
- `pytest-flakes`: check source code with pyflakes.

To see a complete list of all plugins with their latest testing status against different pytest and Python versions, please visit Pytest Plugin List.

You may also discover more plugins through a pytest-pypi.org search.

2.14.1 Requiring/Loading plugins in a test module or conftest file

You can require plugins in a test module or a conftest file using `pytest_plugins`:

```python
pytest_plugins = ("myapp.testsupport.myplugin",)
```

When the test module or conftest plugin is loaded the specified plugins will be loaded as well.

**Note:** Requiring plugins using a `pytest_plugins` variable in non-root `conftest.py` files is deprecated. See full explanation in the Writing plugins section.

**Note:** The name `pytest_plugins` is reserved and should not be used as a name for a custom plugin module.
2.14.2 Finding out which plugins are active

If you want to find out which plugins are active in your environment you can type:

```
pytest --trace-config
```

and will get an extended test header which shows activated plugins and their names. It will also print local plugins aka `conftest.py` files when they are loaded.

2.14.3 Deactivating / unregistering a plugin by name

You can prevent plugins from loading or unregister them:

```
pytest -p no:NAME
```

This means that any subsequent try to activate/load the named plugin will not work.

If you want to unconditionally disable a plugin for a project, you can add this option to your `pytest.ini` file:

```
[pytest]
addopts = -p no:NAME
```

Alternatively to disable it only in certain environments (for example in a CI server), you can set `PYTEST_ADDOPTS` environment variable to `-p no:name`.

See *Finding out which plugins are active* for how to obtain the name of a plugin.

2.15 Writing plugins

It is easy to implement local `conftest plugins` for your own project or `pip-installable plugins` that can be used throughout many projects, including third party projects. Please refer to *How to install and use plugins* if you only want to use but not write plugins.

A plugin contains one or multiple hook functions. *Writing hooks* explains the basics and details of how you can write a hook function yourself. *pytest* implements all aspects of configuration, collection, running and reporting by calling well specified hooks of the following plugins:

- built-in plugins: loaded from `pytest`'s internal `_pytest` directory.
- `external plugins`: installed third-party modules discovered through `entry points` in their packaging metadata
- `conftest.py plugins`: modules auto-discovered in test directories

In principle, each hook call is a `1:N` Python function call where `N` is the number of registered implementation functions for a given specification. All specifications and implementations follow the `pytest_` prefix naming convention, making them easy to distinguish and find.
2.15.1 Plugin discovery order at tool startup

pytest loads plugin modules at tool startup in the following way:

1. by scanning the command line for the `-p no:name` option and blocking that plugin from being loaded (even builtin plugins can be blocked this way). This happens before normal command-line parsing.

2. by loading all builtin plugins.

3. by scanning the command line for the `-p name` option and loading the specified plugin. This happens before normal command-line parsing.

4. by loading all plugins registered through installed third-party package `entry points`.

5. by loading all plugins specified through the `PYTEST_PLUGINS` environment variable.

6. by loading all “initial” `conftest.py` files:
   - determine the test paths: specified on the command line, otherwise in `testpaths` if defined and running from the rootdir, otherwise the current dir
   - for each test path, load `conftest.py` and `test*/conftest.py` relative to the directory part of the test path, if exist. Before a `conftest.py` file is loaded, load `conftest.py` files in all of its parent directories. After a `conftest.py` file is loaded, recursively load all plugins specified in its `pytest_plugins` variable if present.

2.15.2 conftest.py: local per-directory plugins

Local `conftest.py` plugins contain directory-specific hook implementations. Hook Session and test running activities will invoke all hooks defined in `conftest.py` files closer to the root of the filesystem. Example of implementing the `pytest_runtest_setup` hook so that is called for tests in the `a` sub directory but not for other directories:

```
a/conftest.py:
    def pytest_runtest_setup(item):
        # called for running each test in 'a' directory
        print("setting up", item)

a/test_sub.py:
    def test_sub():
        pass

test_flat.py:
    def test_flat():
        pass
```

Here is how you might run it:

```
pytest test_flat.py --capture=no  # will not show "setting up"
pytest a/test_sub.py --capture=no  # will show "setting up"
```

**Note:** If you have `conftest.py` files which do not reside in a python package directory (i.e. one containing an `__init__.py`) then “import conftest” can be ambiguous because there might be other `conftest.py` files as well on your `PYTHONPATH` or `sys.path`. It is thus good practice for projects to either put `conftest.py` under a package scope or to never import anything from a `conftest.py` file.

See also: `pytest import mechanisms and sys.path/PYTHONPATH`.

2.15. Writing plugins 95
Note: Some hooks cannot be implemented in conftest.py files which are not initial due to how pytest discovers plugins during startup. See the documentation of each hook for details.

### 2.15.3 Writing your own plugin

If you want to write a plugin, there are many real-life examples you can copy from:

- a custom collection example plugin: A basic example for specifying tests in Yaml files
- builtin plugins which provide pytest's own functionality
- many external plugins providing additional features

All of these plugins implement hooks and/or fixtures to extend and add functionality.

Note: Make sure to check out the excellent cookiecutter-pytest-plugin project, which is a cookiecutter template for authoring plugins.

The template provides an excellent starting point with a working plugin, tests running with tox, a comprehensive README file as well as a pre-configured entry-point.

Also consider contributing your plugin to pytest-dev once it has some happy users other than yourself.

### 2.15.4 Making your plugin installable by others

If you want to make your plugin externally available, you may define a so-called entry point for your distribution so that pytest finds your plugin module. Entry points are a feature that is provided by packaging tools.

pytest looks up the pytest11 entrypoint to discover its plugins, thus you can make your plugin available by defining it in your pyproject.toml file.

```toml
# sample ./pyproject.toml file
[build-system]
requires = ["hatchling"]
build-backend = "hatchling.build"

[project]
name = "myproject"
classifiers = [
    "Framework :: Pytest",
]

[project.entry-points.pytest11]
myproject = "myproject.pluginmodule"
```

If a package is installed this way, pytest will load myproject.pluginmodule as a plugin which can define hooks. Confirm registration with pytest --trace-config

Note: Make sure to include Framework :: Pytest in your list of PyPI classifiers to make it easy for users to find your plugin.
2.15.5 Assertion Rewriting

One of the main features of pytest is the use of plain assert statements and the detailed introspection of expressions upon assertion failures. This is provided by “assertion rewriting” which modifies the parsed AST before it gets compiled to bytecode. This is done via a PEP 302 import hook which gets installed early on when pytest starts up and will perform this rewriting when modules get imported. However, since we do not want to test different bytecode from what you will run in production, this hook only rewrites test modules themselves (as defined by the python_files configuration option), and any modules which are part of plugins. Any other imported module will not be rewritten and normal assertion behaviour will happen.

If you have assertion helpers in other modules where you would need assertion rewriting to be enabled you need to ask pytest explicitly to rewrite this module before it gets imported.

```
register_assert_rewrite(*names)
```

Register one or more module names to be rewritten on import.

This function will make sure that this module or all modules inside the package will get their assert statements rewritten. Thus you should make sure to call this before the module is actually imported, usually in your __init__.py if you are a plugin using a package.

Parameters

*names (str)* – The module names to register.

This is especially important when you write a pytest plugin which is created using a package. The import hook only treats conftest.py files and any modules which are listed in the pytest11 entrypoint as plugins. As an example consider the following package:

```
pytest_foo/__init__.py
pytest_foo/plugin.py
pytest_foo/helper.py
```

With the following typical setup.py extract:

```
setup(..., entry_points={"pytest11": ["foo = pytest_foo.plugin"], ...})
```

In this case only pytest_foo/plugin.py will be rewritten. If the helper module also contains assert statements which need to be rewritten it needs to be marked as such, before it gets imported. This is easiest by marking it for rewriting inside the __init__.py module, which will always be imported first when a module inside a package is imported. This way plugin.py can still import helper.py normally. The contents of pytest_foo/__init__.py will then need to look like this:

```
import pytest

pytest.register_assert_rewrite("pytest_foo.helper")
```

2.15.6 Requiring/Loading plugins in a test module or conftest file

You can require plugins in a test module or a conftest.py file using pytest_plugins:

```
pytest_plugins = ["name1", "name2"]
```

When the test module or conftest plugin is loaded the specified plugins will be loaded as well. Any module can be blessed as a plugin, including internal application modules:

```
pytest_plugins = "myapp.testsupport.myplugin"
```
**pytest_plugins** are processed recursively, so note that in the example above if `myapp.testsupport.myplugin` also declares `pytest_plugins`, the contents of the variable will also be loaded as plugins, and so on.

**Note:** Requiring plugins using `pytest_plugins` variable in non-root `conftest.py` files is deprecated.

This is important because `conftest.py` files implement per-directory hook implementations, but once a plugin is imported, it will affect the entire directory tree. In order to avoid confusion, defining `pytest_plugins` in any `conftest.py` file which is not located in the tests root directory is deprecated, and will raise a warning.

This mechanism makes it easy to share fixtures within applications or even external applications without the need to create external plugins using the entry point packaging metadata technique.

Plugins imported by `pytest_plugins` will also automatically be marked for assertion rewriting (see `pytest.register_assert_rewrite()`). However for this to have any effect the module must not be imported already; if it was already imported at the time the `pytest_plugins` statement is processed, a warning will result and assertions inside the plugin will not be rewritten. To fix this you can either call `pytest.register_assert_rewrite()` yourself before the module is imported, or you can arrange the code to delay the importing until after the plugin is registered.

2.15.7 Accessing another plugin by name

If a plugin wants to collaborate with code from another plugin it can obtain a reference through the plugin manager like this:

```python
plugin = config.pluginmanager.get_plugin("name_of_plugin")
```

If you want to look at the names of existing plugins, use the `--trace-config` option.

2.15.8 Registering custom markers

If your plugin uses any markers, you should register them so that they appear in pytest’s help text and do not cause spurious warnings. For example, the following plugin would register `cool_marker` and `mark_with` for all users:

```python
def pytest_configure(config):
    config.addinivalue_line("markers", "cool_marker: this one is for cool tests.")
    config.addinivalue_line("markers", "mark_with(arg, arg2): this marker takes arguments.")
```

2.15.9 Testing plugins

pytest comes with a plugin named `pytester` that helps you write tests for your plugin code. The plugin is disabled by default, so you will have to enable it before you can use it.

You can do so by adding the following line to a `conftest.py` file in your testing directory:

```python
# content of conftest.py
pytest_plugins = ["pytester"]
```

Alternatively you can invoke pytest with the `--p pytester` command line option.

This will allow you to use the `pytester` fixture for testing your plugin code.
Let's demonstrate what you can do with the plugin with an example. Imagine we developed a plugin that provides a fixture `hello` which yields a function and we can invoke this function with one optional parameter. It will return a string value of `Hello World!` if we do not supply a value or `Hello {value}!` if we do supply a string value.

```python
import pytest

def pytest_addoption(parser):
    group = parser.getgroup("helloworld")
    group.addoption(
        "--name",
        action="store",
        dest="name",
        default="World",
        help='Default "name" for hello().',
    )

@pytest.fixture
def hello(request):
    name = request.config.getoption("name")

    def _hello(name=None):
        if not name:
            name = request.config.getoption("name")
        return f"Hello {name}!"
    return _hello

Now the pytester fixture provides a convenient API for creating temporary `conftest.py` files and test files. It also allows us to run the tests and return a result object, with which we can assert the tests' outcomes.

```python

def test_hello(pytester):
    """Make sure that our plugin works."
    ""

    # create a temporary conftest.py file
    pytester.makeconftest(""
        import pytest
        @pytest.fixture(params=[
            "Brianna",
            "Andreas",
            "Floris",
        ])  
        def name(request):
            return request.param
    ""
    )

    # create a temporary pytest test file
    pytester.makepyfile(""
        def test_hello_default(hello):
            assert hello() == "Hello World!"

        def test_hello_name(hello, name):
            assert hello(name) == "Hello {0}!".format(name)
    ""

    # run pytest
    result = pytester.runpytest("test_hello.py")

    assert result.ret == 0
```

(continues on next page)

Additionally it is possible to copy examples to the pytester’s isolated environment before running pytest on it. This way we can abstract the tested logic to separate files, which is especially useful for longer tests and/or longer conftest.py files.

Note that for pytester.copy_example to work we need to set pytester_example_dir in our pytest.ini to tell pytest where to look for example files.

For more information about the result object that runpytest() returns, and the methods that it provides please check out the RunResult documentation.
2.16 Writing hook functions

2.16.1 hook function validation and execution

pytest calls hook functions from registered plugins for any given hook specification. Let's look at a typical hook function for the `pytest_collection_modifyitems(session, config, items)` hook which pytest calls after collection of all test items is completed.

When we implement a `pytest_collection_modifyitems` function in our plugin pytest will during registration verify that you use argument names which match the specification and bail out if not.

Let's look at a possible implementation:

```python
def pytest_collection_modifyitems(config, items):
    # called after collection is completed
    # you can modify the `items` list
    ...
```

Here, pytest will pass in `config` (the pytest config object) and `items` (the list of collected test items) but will not pass in the `session` argument because we didn't list it in the function signature. This dynamic “pruning” of arguments allows pytest to be “future-compatible”: we can introduce new hook named parameters without breaking the signatures of existing hook implementations. It is one of the reasons for the general long-lived compatibility of pytest plugins.

Note that hook functions other than `pytest_runtest_*` are not allowed to raise exceptions. Doing so will break the pytest run.

2.16.2 firstresult: stop at first non-None result

Most calls to pytest hooks result in a list of results which contains all non-None results of the called hook functions. Some hook specifications use the `firstresult=True` option so that the hook call only executes until the first of N registered functions returns a non-None result which is then taken as result of the overall hook call. The remaining hook functions will not be called in this case.

2.16.3 hook wrappers: executing around other hooks

pytest plugins can implement hook wrappers which wrap the execution of other hook implementations. A hook wrapper is a generator function which yields exactly once. When pytest invokes hooks it first executes hook wrappers and passes the same arguments as to the regular hooks.

At the yield point of the hook wrapper pytest will execute the next hook implementations and return their result to the yield point, or will propagate an exception if they raised.

Here is an example definition of a hook wrapper:

```python
import pytest

@pytest.hookimpl(wrapper=True)
def pytest_pyfunc_call(pyfuncitem):
    do_something_before_next_hook_executes()

    # If the outcome is an exception, will raise the exception.
    res = yield
```

(continues on next page)
new_res = post_process_result(res)

# Override the return value to the plugin system.
return new_res

The hook wrapper needs to return a result for the hook, or raise an exception.

In many cases, the wrapper only needs to perform tracing or other side effects around the actual hook implementations, in which case it can return the result value of the \texttt{yield}. The simplest (though useless) hook wrapper is \texttt{return (yield)}.

In other cases, the wrapper wants the adjust or adapt the result, in which case it can return a new value. If the result of the underlying hook is a mutable object, the wrapper may modify that result, but it's probably better to avoid it.

If the hook implementation failed with an exception, the wrapper can handle that exception using a \texttt{try-catch-finally} around the \texttt{yield}, by propagating it, suppressing it, or raising a different exception entirely.

For more information, consult the \texttt{pluggy} documentation about hook wrappers.

### 2.16.4 Hook function ordering / call example

For any given hook specification there may be more than one implementation and we thus generally view hook execution as a 1:N function call where N is the number of registered functions. There are ways to influence if a hook implementation comes before or after others, i.e. the position in the N-sized list of functions:

```python
# Plugin 1
@pytest.hookimpl(tryfirst=True)
def pytest_collection_modifyitems(items):
    # will execute as early as possible
    ...

# Plugin 2
@pytest.hookimpl(trylast=True)
def pytest_collection_modifyitems(items):
    # will execute as late as possible
    ...

# Plugin 3
@ pytest.hookimpl (wrapper=True)
def pytest_collection_modifyitems(items):
    # will execute even before the tryfirst one above!
    try:
        return (yield)
    finally:
        # will execute after all non-wrappers executed
        ...
```

Here is the order of execution:

1. Plugin3’s \texttt{pytest_collection_modifyitems} called until the yield point because it is a hook wrapper.
2. Plugin1’s \texttt{pytest_collection_modifyitems} is called because it is marked with \texttt{tryfirst=True}.
3. Plugin2’s \texttt{pytest_collection_modifyitems} is called because it is marked with \texttt{trylast=True} (but even without this mark it would come after Plugin1).
4. Plugin3’s pytest_collection_modifyitems then executing the code after the yield point. The yield receives the result from calling the non-wrappers, or raises an exception if the non-wrappers raised.

It's possible to use tryfirst and trylast also on hook wrappers in which case it will influence the ordering of hook wrappers among each other.

### 2.16.5 Declaring new hooks

**Note:** This is a quick overview on how to add new hooks and how they work in general, but a more complete overview can be found in the pluggy documentation.

Plugins and conftest.py files may declare new hooks that can then be implemented by other plugins in order to alter behaviour or interact with the new plugin:

**pytest_addhooks** *(pluginmanager)*

Called at plugin registration time to allow adding new hooks via a call to `pluginmanager.add_hookspecs(module_or_class, prefix)`.

**Parameters**

- `pluginmanager` *(PytestPluginManager)* – The pytest plugin manager.

**Note:** This hook is incompatible with hook wrappers.

### Use in conftest plugins

If a conftest plugin implements this hook, it will be called immediately when the conftest is registered.

Hooks are usually declared as do-nothing functions that contain only documentation describing when the hook will be called and what return values are expected. The names of the functions must start with `pytest_` otherwise pytest won't recognize them.

Here's an example. Let's assume this code is in the `sample_hook.py` module.

```python
def pytest_my_hook(config):
    """
    Receives the pytest config and does things with it
    """
```

To register the hooks with pytest they need to be structured in their own module or class. This class or module can then be passed to the `pluginmanager` using the `pytest_addhooks` function (which itself is a hook exposed by pytest).

```python
def pytest_addhooks(pluginmanager):
    """This example assumes the hooks are grouped in the 'sample_hook' module."""
    from my_app.tests import sample_hook
    pluginmanager.add_hookspecs(sample_hook)
```

For a real world example, see `newhooks.py` from xdist.

Hooks may be called both from fixtures or from other hooks. In both cases, hooks are called through the `hook` object, available in the `config` object. Most hooks receive a `config` object directly, while fixtures may use the `pytest-config` fixture which provides the same object.
@pytest.fixture()
def my_fixture(pytestconfig):
    # call the hook called "pytest_my_hook"
    # 'result' will be a list of return values from all registered functions.
    result = pytestconfig.hook.pytest_my_hook(config=pytestconfig)

Note: Hooks receive parameters using only keyword arguments.

Now your hook is ready to be used. To register a function at the hook, other plugins or users must now simply define the function pytest_my_hook with the correct signature in their conftest.py.

Example:

def pytest_my_hook(config):
    """Print all active hooks to the screen."""
    print(config.hook)

2.16.6 Using hooks in pytest_addoption

Occasionally, it is necessary to change the way in which command line options are defined by one plugin based on hooks in another plugin. For example, a plugin may expose a command line option for which another plugin needs to define the default value. The pluginmanager can be used to install and use hooks to accomplish this. The plugin would define and add the hooks and use pytest_addoption as follows:

```
# contents of hooks.py

# Use firstresult=True because we only want one plugin to define this
# default value
@hookspec(firstresult=True)
def pytest_config_file_default_value():
    """Return the default value for the config file command line option."""

# contents of myplugin.py

def pytest_addhooks(pluginmanager):
    """This example assumes the hooks are grouped in the 'hooks' module.""
    from . import hooks
    pluginmanager.add_hookspecs(hooks)

def pytest_addoption(parser, pluginmanager):
    default_value = pluginmanager.hook.pytest_config_file_default_value()
    parser.addoption(
        "--config-file",
        help="Config file to use, defaults to %(default)s",
        default=default_value,
    )
```

The conftest.py that is using myplugin would simply define the hook as follows:
def pytest_config_file_default_value():
    return "config.yaml"

2.16.7 Optionally using hooks from 3rd party plugins

Using new hooks from plugins as explained above might be a little tricky because of the standard validation mechanism: if you depend on a plugin that is not installed, validation will fail and the error message will not make much sense to your users.

One approach is to defer the hook implementation to a new plugin instead of declaring the hook functions directly in your plugin module, for example:

```python
# contents of myplugin.py

class DeferPlugin:
    """Simple plugin to defer pytest-xdist hook functions."""

def pytest_testnodedown(self, node, error):
    """standard xdist hook function."""

def pytest_configure(config):
    if config.pluginmanager.hasplugin("xdist"):
        config.pluginmanager.register(DeferPlugin())
```

This has the added benefit of allowing you to conditionally install hooks depending on which plugins are installed.

2.16.8 Storing data on items across hook functions

Plugins often need to store data on Items in one hook implementation, and access it in another. One common solution is to just assign some private attribute directly on the item, but type-checkers like mypy frown upon this, and it may also cause conflicts with other plugins. So pytest offers a better way to do this, item.stash.

To use the “stash” in your plugins, first create “stash keys” somewhere at the top level of your plugin:

```python
been_there_key = pytest.StashKey[bool]()
done_that_key = pytest.StashKey[str]()
```

then use the keys to stash your data at some point:

```python
def pytest_runtest_setup(item: pytest.Item) -> None:
    item.stash[been_there_key] = True
    item.stash[done_that_key] = "no"
```

and retrieve them at another point:

```python
def pytest_runtest_teardown(item: pytest.Item) -> None:
    if not item.stash[been_there_key]:
        print("Oh?")
    item.stash[done_that_key] = "yes!"
```

Stashes are available on all node types (like Class, Session) and also on Config, if needed.
2.17 How to use pytest with an existing test suite

Pytest can be used with most existing test suites, but its behavior differs from other test runners such as Python's default unittest framework.

Before using this section you will want to install pytest.

2.17.1 Running an existing test suite with pytest

Say you want to contribute to an existing repository somewhere. After pulling the code into your development space using some flavor of version control and (optionally) setting up a virtualenv you will want to run:

```bash
cd <repository>
pip install -e .  # Environment dependent alternatives include
                 # 'python setup.py develop' and 'conda develop'
```

in your project root. This will set up a symlink to your code in site-packages, allowing you to edit your code while your tests run against it as if it were installed.

Setting up your project in development mode lets you avoid having to reinstall every time you want to run your tests, and is less brittle than mucking about with sys.path to point your tests at local code.

Also consider using tox.

2.18 How to use unittest-based tests with pytest

pytest supports running Python unittest-based tests out of the box. It's meant for leveraging existing unittest-based test suites to use pytest as a test runner and also allow to incrementally adapt the test suite to take full advantage of pytest's features.

To run an existing unittest-style test suite using pytest, type:

```bash
pytest tests
```

pytest will automatically collect unittest.TestCase subclasses and their test methods in test_*.py or *_test.py files.

Almost all unittest features are supported:

- @unittest.skip style decorators;
- setUp/tearDown;
- setUpClass/tearDownClass;
- setUpModule/tearDownModule;

Additionally, subtests are supported by the pytest-subtests plugin.

Up to this point pytest does not have support for the following features:

- load_tests protocol;
2.18.1 Benefits out of the box

By running your test suite with pytest you can make use of several features, in most cases without having to modify existing code:

- Obtain more informative tracebacks;
- `stdout` and `stderr` capturing;
- Test selection options using `-k` and `-m` flags;
- maxfail;
- `--pdb` command-line option for debugging on test failures (see note below);
- Distribute tests to multiple CPUs using the `pytest-xdist` plugin;
- Use `plain assert-statements` instead of `self.assert*` functions (`unittest2pytest` is immensely helpful in this);

2.18.2 pytest features in `unittest.TestCase` subclasses

The following pytest features work in `unittest.TestCase` subclasses:

- Marks: `skip`, `skipif`, `xfail`;
- Auto-use fixtures;

The following pytest features do not work, and probably never will due to different design philosophies:

- Fixtures (except for `autouse` fixtures, see below);
- Parametrization;
- Custom hooks;

Third party plugins may or may not work well, depending on the plugin and the test suite.

2.18.3 Mixing pytest fixtures into `unittest.TestCase` subclasses using marks

Running your unittest with pytest allows you to use its fixture mechanism with `unittest.TestCase` style tests. Assuming you have at least skimmed the pytest fixture features, let’s jump-start into an example that integrates a pytest `db_class` fixture, setting up a class-cached database object, and then reference it from a unittest-style test:

```python
# content of conftest.py

# we define a fixture function below and it will be "used" by
# referencing its name from tests

import pytest

@pytest.fixture(scope="class")
def db_class(request):
    class DummyDB:
        pass

    # set a class attribute on the invoking test context
    request.cls.db = DummyDB()
```

2.18. How to use `unittest-based tests with pytest`
This defines a fixture function `db_class` which - if used - is called once for each test class and which sets the class-level `db` attribute to a `DummyDB` instance. The fixture function achieves this by receiving a special `request` object which gives access to the `requesting test context` such as the `cls` attribute, denoting the class from which the fixture is used. This architecture de-couples fixture writing from actual test code and allows re-use of the fixture by a minimal reference, the fixture name. So let's write an actual `unittest.TestCase` class using our fixture definition:

```python
# content of test_unittest_db.py

import unittest
import pytest

@pytest.mark.usefixtures("db_class")
class MyTest(unittest.TestCase):
    def test_method1(self):
        assert hasattr(self, "db")
        assert 0, self.db  # fail for demo purposes

    def test_method2(self):
        assert 0, self.db  # fail for demo purposes
```

The `@pytest.mark.usefixtures("db_class")` class-decorator makes sure that the pytest fixture function `db_class` is called once per class. Due to the deliberately failing assert statements, we can take a look at the `self.db` values in the traceback:

```
$ pytest test_unittest_db.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items
test_unittest_db.py FF [100%]

================================ FAILURES =================================
___________________________ MyTest.test_method1 ____________________________
self = <test_unittest_db.MyTest testMethod=test_method1>
    def test_method1(self):
        assert hasattr(self, "db")
>       assert 0, self.db  # fail for demo purposes
E       AssertionError: <conftest.db_class.<locals>.DummyDB object at 0xdeadbeef0001>
E       assert 0

test_unittest_db.py:11: AssertionError
    def test_method2(self):
>       assert 0, self.db  # fail for demo purposes
E       AssertionError: <conftest.db_class.<locals>.DummyDB object at 0xdeadbeef0001>
E       assert 0

test_unittest_db.py:14: AssertionError
```

(continues on next page)
This default pytest traceback shows that the two test methods share the same `self.db` instance which was our intention when writing the class-scoped fixture function above.

### 2.18.4 Using autouse fixtures and accessing other fixtures

Although it's usually better to explicitly declare use of fixtures you need for a given test, you may sometimes want to have fixtures that are automatically used in a given context. After all, the traditional style of unittest-setup mandates the use of this implicit fixture writing and chances are, you are used to it or like it.

You can flag fixture functions with `@pytest.fixture(autouse=True)` and define the fixture function in the context where you want it used. Let's look at an `initdir` fixture which makes all test methods of a `TestCase` class execute in a temporary directory with a pre-initialized `samplefile.ini`. Our `initdir` fixture itself uses the pytest builtin `tmp_path` fixture to delegate the creation of a per-test temporary directory:

```python
# content of test_unittest_cleandir.py
import unittest
import pytest

class MyTest(unittest.TestCase):
    @pytest.fixture(autouse=True)
    def initdir(self, tmp_path, monkeypatch):
        monkeypatch.chdir(tmp_path)  # change to pytest-provided temporary directory
        tmp_path.joinpath("samplefile.ini").write_text("# testdata", encoding="utf-8")

        def test_method(self):
            with open("samplefile.ini", encoding="utf-8") as f:
                s = f.read()
            assert "testdata" in s
```

Due to the `autouse` flag the `initdir` fixture function will be used for all methods of the class where it is defined. This is a shortcut for using `@pytest.mark.usefixtures("initdir")` marker on the class like in the previous example.

Running this test module ...:

```bash
$ pytest -q test_unittest_cleandir.py
.
1 passed in 0.12s [100%]
```

... gives us one passed test because the `initdir` fixture function was executed ahead of the `test_method`.

**Note:** `unittest.TestCase` methods cannot directly receive fixture arguments as implementing that is likely to inflict on the ability to run general unittest.TestCase test suites.

The above `usefixtures` and `autouse` examples should help to mix in pytest fixtures into unittest suites.

You can also gradually move away from subclassing from `unittest.TestCase` to `plain asserts` and then start to benefit from the full pytest feature set step by step.
Note: Due to architectural differences between the two frameworks, setup and teardown for unittest-based tests is performed during the call phase of testing instead of in pytest's standard setup and teardown stages. This can be important to understand in some situations, particularly when reasoning about errors. For example, if a unittest-based suite exhibits errors during setup, pytest will report no errors during its setup phase and will instead raise the error during call.

2.19 How to implement xunit-style set-up

This section describes a classic and popular way how you can implement fixtures (setup and teardown test state) on a per-module/class/function basis.

Note: While these setup/teardown methods are simple and familiar to those coming from a unittest or nose background, you may also consider using pytest's more powerful fixture mechanism which leverages the concept of dependency injection, allowing for a more modular and more scalable approach for managing test state, especially for larger projects and for functional testing. You can mix both fixture mechanisms in the same file but test methods of unittest.TestCase subclasses cannot receive fixture arguments.

2.19.1 Module level setup/teardown

If you have multiple test functions and test classes in a single module you can optionally implement the following fixture methods which will usually be called once for all the functions:

```python
def setup_module(module):
    """setup any state specific to the execution of the given module."""

def teardown_module(module):
    """teardown any state that was previously setup with a setup_module method."""
```

As of pytest-3.0, the module parameter is optional.

2.19.2 Class level setup/teardown

Similarly, the following methods are called at class level before and after all test methods of the class are called:

```python
@classmethod
def setup_class(cls):
    """setup any state specific to the execution of the given class (which usually contains tests).""

@classmethod
def teardown_class(cls):
    """teardown any state that was previously setup with a call to setup_class.""
```
2.19.3 Method and function level setup/teardown

Similarly, the following methods are called around each method invocation:

```python
def setup_method(self, method):
    """setup any state tied to the execution of the given method in a
class. setup_method is invoked for every test method of a class.
"""

def teardown_method(self, method):
    """teardown any state that was previously setup with a setup_method
call.
"""
```

As of pytest-3.0, the `method` parameter is optional.

If you would rather define test functions directly at module level you can also use the following functions to implement fixtures:

```python
def setup_function(function):
    """setup any state tied to the execution of the given function.
Invoked for every test function in the module.
"""

def teardown_function(function):
    """teardown any state that was previously setup with a setup_function
call.
"""
```

As of pytest-3.0, the `function` parameter is optional.

Remarks:

- It is possible for setup/teardown pairs to be invoked multiple times per testing process.
- teardown functions are not called if the corresponding setup function existed and failed/was skipped.
- Prior to pytest-4.2, xunit-style functions did not obey the scope rules of fixtures, so it was possible, for example, for a `setup_method` to be called before a session-scoped autouse fixture.

Now the xunit-style functions are integrated with the fixture mechanism and obey the proper scope rules of fixtures involved in the call.

2.20 How to set up bash completion

When using bash as your shell, pytest can use argcomplete (https://kislyuk.github.io/argcomplete/) for auto-completion. For this argcomplete needs to be installed and enabled.

Install argcomplete using:

```
sudo pip install 'argcomplete>=0.5.7'
```

For global activation of all argcomplete enabled python applications run:

```
sudo activate-global-python-argcomplete
```
For permanent (but not global) pytest activation, use:

```bash
register-python-argcomplete pytest >> ~/.bashrc
```

For one-time activation of argcomplete for pytest only, use:

```bash
eval "$(register-python-argcomplete pytest)"
```
3.1 Fixtures reference

About fixtures

See also:

How to use fixtures

3.1.1 Built-in fixtures

Fixtures are defined using the `@pytest.fixture` decorator. Pytest has several useful built-in fixtures:

- **capfd**
  Capture, as text, output to file descriptors 1 and 2.

- **capfdbinary**
  Capture, as bytes, output to file descriptors 1 and 2.

- **caplog**
  Control logging and access log entries.

- **capsys**
  Capture, as text, output to `sys.stdout` and `sys.stderr`.

- **capsysbinary**
  Capture, as bytes, output to `sys.stdout` and `sys.stderr`.

- **cache**
  Store and retrieve values across pytest runs.

- **doctest_namespace**
  Provide a dict injected into the doctests namespace.

- **monkeypatch**
  Temporarily modify classes, functions, dictionaries, `os.environ`, and other objects.

- **pytestconfig**
  Access to configuration values, pluginmanager and plugin hooks.

- **record_property**
  Add extra properties to the test.

- **record_testsuite_property**
  Add extra properties to the test suite.
Record warnings emitted by test functions.

Provide information on the executing test function.

Provide a temporary test directory to aid in running, and testing, pytest plugins.

Provide a `pathlib.Path` object to a temporary directory which is unique to each test function.

Make session-scoped temporary directories and return `pathlib.Path` objects.

Provide a `py.path.local` object to a temporary directory which is unique to each test function; replaced by `tmp_path`.

Make session-scoped temporary directories and return `py.path.local` objects; replaced by `tmp_path_factory`.

### 3.1.2 Fixture availability

Fixture availability is determined from the perspective of the test. A fixture is only available for tests to request if they are in the scope that fixture is defined in. If a fixture is defined inside a class, it can only be requested by tests inside that class. But if a fixture is defined inside the global scope of the module, then every test in that module, even if it’s defined inside a class, can request it.

Similarly, a test can also only be affected by an autouse fixture if that test is in the same scope that autouse fixture is defined in (see `Autouse fixtures are executed first within their scope`).

A fixture can also request any other fixture, no matter where it’s defined, so long as the test requesting them can see all fixtures involved.

For example, here’s a test file with a fixture (`outer`) that requests a fixture (`inner`) from a scope it wasn’t defined in:

```python
from __future__ import annotations

import pytest

@pytest.fixture
def order():
    return []

@pytest.fixture
def outer(order, inner):
    order.append("outer")

class TestOne:
    @pytest.fixture
    def inner(self, order):
        order.append("one")

    def test_order(self, order, outer):
        # continues on next page
```
```
assert order == ["one", "outer"]
```

```python
class TestTwo:
    @pytest.fixture
    def inner(self, order):
        order.append("two")

    def test_order(self, order, outer):
        assert order == ["two", "outer"]
```

From the tests’ perspectives, they have no problem seeing each of the fixtures they’re dependent on:

So when they run, `outer` will have no problem finding `inner`, because pytest searched from the tests’ perspectives.

**Note:** The scope a fixture is defined in has no bearing on the order it will be instantiated in: the order is mandated by the logic described *here*.  

### 3.1. Fixtures reference

115
conftest.py: sharing fixtures across multiple files

The conftest.py file serves as a means of providing fixtures for an entire directory. Fixtures defined in a conftest.py can be used by any test in that package without needing to import them (pytest will automatically discover them).

You can have multiple nested directories/packages containing your tests, and each directory can have its own conftest.py with its own fixtures, adding on to the ones provided by the conftest.py files in parent directories.

For example, given a test file structure like this:

```python
# content of tests/conftest.py
import pytest

@ pytest.fixture
def order():
    return []

@ pytest.fixture
def top(order, innermost):
    order.append("top")

# content of tests/test_top.py
import pytest

@ pytest.fixture
def innermost(order):
    order.append("innermost")

def test_order(order, top):
    assert order == ["innermost", "top"]

# content of tests/subpackage/conftest.py
import pytest

@ pytest.fixture
def mid(order):
    order.append("mid subpackage")

# content of tests/subpackage/test_subpackage.py
import pytest

@ pytest.fixture
def innermost(order, mid):
    order.append("innermost subpackage")

def test_order(order, top):
    assert order == ["mid subpackage", "innermost subpackage", "top"]
```

The boundaries of the scopes can be visualized like this:
The directories become their own sort of scope where fixtures that are defined in a `conftest.py` file in that directory become available for that whole scope.

Tests are allowed to search upward (stepping outside a circle) for fixtures, but can never go down (stepping inside a circle) to continue their search. So `tests/subpackage/test_subpackage.py::test_order` would be able to find the innermost fixture defined in `tests/subpackage/test_subpackage.py`, but the one defined in `tests/test_top.py` would be unavailable to it because it would have to step down a level (step inside a circle) to find it.

The first fixture the test finds is the one that will be used, so fixtures can be overridden if you need to change or extend what one does for a particular scope.

You can also use the `conftest.py` file to implement local per-directory plugins.
Fixtures from third-party plugins

Fixtures don’t have to be defined in this structure to be available for tests, though. They can also be provided by third-party plugins that are installed, and this is how many pytest plugins operate. As long as those plugins are installed, the fixtures they provide can be requested from anywhere in your test suite.

Because they’re provided from outside the structure of your test suite, third-party plugins don’t really provide a scope like `conftest.py` files and the directories in your test suite do. As a result, pytest will search for fixtures stepping out through scopes as explained previously, only reaching fixtures defined in plugins last.

For example, given the following file structure:

```plaintext
tests/
   __init__.py
conftest.py
   # content of tests/conftest.py
   import pytest
   @pytest.fixture
   def order():
       return []

subpackage/
   __init__.py
   conftest.py
   # content of tests/subpackage/conftest.py
   import pytest
   @pytest.fixture(autouse=True)
   def mid(order, b_fix):
       order.append("mid subpackage")

test_subpackage.py
   # content of tests/subpackage/test_subpackage.py
   import pytest
   @pytest.fixture
   def inner(order, mid, a_fix):
       order.append("inner subpackage")
       def test_order(order, inner):
           assert order == ["b_fix", "mid subpackage", "a_fix", "inner subpackage"]
```

If `plugin_a` is installed and provides the fixture `a_fix`, and `plugin_b` is installed and provides the fixture `b_fix`, then this is what the test’s search for fixtures would look like:
pytest will only search for `a_fix` and `b_fix` in the plugins after searching for them first in the scopes inside `tests/`.

### 3.1.3 Fixture instantiation order

When pytest wants to execute a test, once it knows what fixtures will be executed, it has to figure out the order they’ll be executed in. To do this, it considers 3 factors:

1. **scope**
2. **dependencies**
3. **autouse**

Names of fixtures or tests, where they’re defined, the order they’re defined in, and the order fixtures are requested in have no bearing on execution order beyond coincidence. While pytest will try to make sure coincidences like these stay consistent from run to run, it’s not something that should be depended on. If you want to control the order, it’s safest to rely on these 3 things and make sure dependencies are clearly established.

**Higher-scoped fixtures are executed first**

Within a function request for fixtures, those of higher-scopes (such as `session`) are executed before lower-scoped fixtures (such as `function` or `class`).

Here’s an example:

```python
from __future__ import annotations

import pytest
```

(continues on next page)
@pytest.fixture(scope="session")
def order():
    return []

@ pytest.fixture
def func(order):
    order.append("function")

@ pytest.fixture(scope="class")
def cls(order):
    order.append("class")

@ pytest.fixture(scope="module")
def mod(order):
    order.append("module")

@ pytest.fixture(scope="package")
def pack(order):
    order.append("package")

@ pytest.fixture(scope="session")
def sess(order):
    order.append("session")

class TestClass:
    def test_order(self, func, cls, mod, pack, sess, order):
        assert order == ['session', 'package', 'module', 'class', 'function']

The test will pass because the larger scoped fixtures are executing first.

The order breaks down to this:
Fixtures of the same order execute based on dependencies

When a fixture requests another fixture, the other fixture is executed first. So if fixture \texttt{a} requests fixture \texttt{b}, fixture \texttt{b} will execute first, because \texttt{a} depends on \texttt{b} and can't operate without it. Even if \texttt{a} doesn't need the result of \texttt{b}, it can still request \texttt{b} if it needs to make sure it is executed after \texttt{b}.

For example:

```
from __future__ import annotations

import pytest

@pytest.fixture
def order():
    return []

@pytest.fixture
```

(continues on next page)
```python
def a(order):
    order.append("a")

@ pytest.fixture
def b(a, order):
    order.append("b")

@ pytest.fixture
def c(b, order):
    order.append("c")

@ pytest.fixture
def d(c, b, order):
    order.append("d")

@ pytest.fixture
def e(d, b, order):
    order.append("e")

@ pytest.fixture
def f(e, order):
    order.append("f")

@ pytest.fixture
def g(f, c, order):
    order.append("g")

def test_order(g, order):
    assert order == ["a", "b", "c", "d", "e", "f", "g"]
```

If we map out what depends on what, we get something that looks like this:
The rules provided by each fixture (as to what fixture(s) each one has to come after) are comprehensive enough that it can be flattened to this:
Enough information has to be provided through these requests in order for pytest to be able to figure out a clear, linear chain of dependencies, and as a result, an order of operations for a given test. If there's any ambiguity, and the order of operations can be interpreted more than one way, you should assume pytest could go with any one of those interpretations at any point.

For example, if d didn't request c, i.e. the graph would look like this:
Because nothing requested \( c \) other than \( g \), and \( g \) also requests \( f \), it's now unclear if \( c \) should go before/after \( f \), \( e \), or \( d \). The only rules that were set for \( c \) is that it must execute after \( b \) and before \( g \).

pytest doesn't know where \( c \) should go in the case, so it should be assumed that it could go anywhere between \( g \) and \( b \). This isn't necessarily bad, but it's something to keep in mind. If the order they execute in could affect the behavior a test is targeting, or could otherwise influence the result of a test, then the order should be defined explicitly in a way that allows pytest to linearize/"flatten" that order.

**Autouse fixtures are executed first within their scope**

Autouse fixtures are assumed to apply to every test that could reference them, so they are executed before other fixtures in that scope. Fixtures that are requested by autouse fixtures effectively become autouse fixtures themselves for the tests that the real autouse fixture applies to.

So if fixture \( a \) is autouse and fixture \( b \) is not, but fixture \( a \) requests fixture \( b \), then fixture \( b \) will effectively be an autouse fixture as well, but only for the tests that \( a \) applies to.

In the last example, the graph became unclear if \( d \) didn't request \( c \). But if \( c \) was autouse, then \( b \) and \( a \) would effectively also be autouse because \( c \) depends on them. As a result, they would all be shifted above non-autouse fixtures within that

---

3.1. Fixtures reference

125
scope.
So if the test file looked like this:

```python
from __future__ import annotations
import pytest

@pytest.fixture
def order():
    return []

@pytest.fixture
def a(order):
    order.append("a")

@pytest.fixture
def b(a, order):
    order.append("b")

@pytest.fixture(autouse=True)
def c(b, order):
    order.append("c")

@pytest.fixture
def d(b, order):
    order.append("d")

@pytest.fixture
def e(d, order):
    order.append("e")

@pytest.fixture
def f(e, order):
    order.append("f")

@pytest.fixture
def g(f, c, order):
    order.append("g")

def test_order_and_g(g, order):
    assert order == ["a", "b", "c", "d", "e", "f", "g"]
```

the graph would look like this:
Because c can now be put above d in the graph, pytest can once again linearize the graph to this:
In this example, `c` makes `b` and `a` effectively autouse fixtures as well.

Be careful with autouse, though, as an autouse fixture will automatically execute for every test that can reach it, even if they don't request it. For example, consider this file:

```python
from __future__ import annotations

import pytest

@test_order
@autouse
def test_order:
    pass
```

(continues on next page)
def order():
    return []

@pytest.fixture(scope="class", autouse=True)
def c1(order):
    order.append("c1")

@pytest.fixture(scope="class")
def c2(order):
    order.append("c2")

@pytest.fixture(scope="class")
def c3(order, c1):
    order.append("c3")

class TestClassWithC1Request:
    def test_order(self, order, c1, c3):
        assert order == ["c1", "c3"]

class TestClassWithoutC1Request:
    def test_order(self, order, c2):
        assert order == ["c1", "c2"]

Even though nothing in TestClassWithoutC1Request is requesting c1, it still is executed for the tests inside it anyway:

But just because one autouse fixture requested a non-autouse fixture, that doesn’t mean the non-autouse fixture becomes an autouse fixture for all contexts that it can apply to. It only effectively becomes an autouse fixture for the contexts the real autouse fixture (the one that requested the non-autouse fixture) can apply to.

For example, take a look at this test file:
from __future__ import annotations

import pytest

@ pytest.fixture
def order():
    return []

@ pytest.fixture
def c1(order):
    order.append("c1")

@ pytest.fixture
def c2(order):
    order.append("c2")

class TestClassWithAutouse:
    @ pytest.fixture(autouse=True)
    def c3(self, order, c2):
        order.append("c3")

    def test_req(self, order, c1):
        assert order == ["c2", "c3", "c1"]

    def test_no_req(self, order):
        assert order == ["c2", "c3"]

class TestClassWithoutAutouse:
    def test_req(self, order, c1):
        assert order == ["c1"]

    def test_no_req(self, order):
        assert order == []
For `test_req` and `test_no_req` inside `TestClassWithAutouse`, c3 effectively makes c2 an autouse fixture, which is why c2 and c3 are executed for both tests, despite not being requested, and why c2 and c3 are executed before c1 for `test_req`.

If this made c2 an actual autouse fixture, then c2 would also execute for the tests inside `TestClassWithoutAutouse`, since they can reference c2 if they wanted to. But it doesn’t, because from the perspective of the `TestClassWithoutAutouse` tests, c2 isn’t an autouse fixture, since they can’t see c3.

### 3.2 Pytest Plugin List

Below is an automated compilation of pytest plugins available on PyPI. It includes PyPI projects whose names begin with `pytest-` or `pytest_` and a handful of manually selected projects. Packages classified as inactive are excluded.

For detailed insights into how this list is generated, please refer to the update script.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Last Release</th>
<th>Status</th>
<th>Requires</th>
</tr>
</thead>
<tbody>
<tr>
<td>logassert</td>
<td>May 20, 2022</td>
<td>5 - Production/Stable</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Simple but powerful assertion and verification of logged lines.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Last Release</th>
<th>Status</th>
<th>Requires</th>
</tr>
</thead>
<tbody>
<tr>
<td>logot</td>
<td>Mar 23, 2024</td>
<td>5 - Production/Stable</td>
<td>pytest&lt;9,&gt;=7; extra == “pytest”</td>
</tr>
</tbody>
</table>

Warning: Please be aware that this list is not a curated collection of projects and does not undergo a systematic review process. It serves purely as an informational resource to aid in the discovery of pytest plugins.

Do not presume any endorsement from the pytest project or its developers, and always conduct your own quality assessment before incorporating any of these plugins into your own projects.
Test whether your code is logging correctly 🪵

**nuts**

*last release: May 28, 2024, status: N/A, requires: pytest<8,>=7*

Network Unit Testing System

**pytest-abq**

*last release: Apr 07, 2023, status: N/A, requires: N/A*

Pytest integration for the ABQ universal test runner.

**pytest-abstracts**

*last release: May 25, 2022, status: N/A, requires: N/A*

A contextmanager pytest fixture for handling multiple mock abstracts

**pytest-accept**

*last release: Feb 10, 2024, status: N/A, requires: pytest (>=6)*

A pytest-plugin for updating doctest outputs

**pytest-adptavist**

*last release: Oct 13, 2022, status: N/A, requires: pytest (>=5.4.0)*

pytest plugin for generating test execution results within Jira Test Management (tm4j)

**pytest-adptavist-fixed**

*last release: Nov 08, 2023, status: N/A, requires: pytest >=5.4.0*

pytest plugin for generating test execution results within Jira Test Management (tm4j)

**pytest-addons-test**

*last release: Aug 02, 2021, status: N/A, requires: pytest (>=6.2.4,<7.0.0)*

用于测试pytest的插件

**pytest-adf**

*last release: May 10, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)*

Pytest plugin for writing Azure Data Factory integration tests

**pytest-adf-azure-identity**

*last release: Mar 06, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)*

Pytest plugin for writing Azure Data Factory integration tests

**pytest-ads-testplan**

*last release: Sep 15, 2022, status: N/A, requires: N/A*

Azure DevOps Test Case reporting for pytest tests

**pytest-affected**

*last release: Nov 06, 2023, status: N/A, requires: N/A*

**pytest-agent**

*last release: Nov 25, 2021, status: N/A, requires: N/A*

Service that exposes a REST API that can be used to interact remotely with Pytest. It is shipped with a dashboard that enables running tests in a more convenient way.

**pytest-aggreport**

*last release: Mar 07, 2021, status: 4 - Beta, requires: pytest (>=6.2.2)*

pytest plugin for pytest-repeat that generate aggregate report of the same test cases with additional statistics details.
pytest-ai1899
   last release: Mar 13, 2024, status: 5 - Production/Stable, requires: N/A
   pytest plugin for connecting to ai1899 smart system stack

pytest-aio
   last release: Apr 08, 2024, status: 5 - Production/Stable, requires: pytest
   Pytest plugin for testing async python code

pytest-aiofiles
   last release: May 14, 2017, status: 5 - Production/Stable, requires: N/A
   pytest fixtures for writing aiofiles tests with pyfakefs

pytest-aiogram
   last release: May 06, 2023, status: N/A, requires: N/A

pytest-aiohttp
   last release: Sep 06, 2023, status: 4 - Beta, requires: pytest >=6.1.0
   Pytest plugin for aiohttp support

pytest-aiohttp-client
   last release: Jan 10, 2023, status: N/A, requires: pytest (>=7.2.0,<8.0.0)
   Pytest ’client’ fixture for the Aiohttp

pytest-aiomoto
   last release: Jun 24, 2023, status: N/A, requires: pytest (>=7.0,<8.0)
   pytest-aiomoto

pytest-aioresponses
   last release: Jul 29, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)
   py.test integration for aioresponses

pytest-aioworkers
   last release: May 01, 2023, status: 5 - Production/Stable, requires: pytest>=6.1.0
   A plugin to test aioworkers project with pytest

pytest-airflow
   last release: Apr 03, 2019, status: 3 - Alpha, requires: pytest (>=4.4.0)
   pytest support for airflow.

pytest-airflow-utils
   last release: Nov 15, 2021, status: N/A, requires: N/A

pytest-alembic
   last release: Mar 04, 2024, status: N/A, requires: pytest (>=6.0)
   A pytest plugin for verifying alembic migrations.

pytest-allclose
   last release: Jul 30, 2019, status: 5 - Production/Stable, requires: pytest
   Pytest fixture extending Numpy’s allclose function

pytest-allure-adaptor
   last release: Jan 10, 2018, status: N/A, requires: pytest (>=2.7.3)
   Plugin for py.test to generate allure xml reports
pytest-allure-adaptor2
   last release: Oct 14, 2020, status: N/A, requires: pytest (>=2.7.3)
   Plugin for py.test to generate allure xml reports

pytest-allure-collection
   last release: Apr 13, 2023, status: N/A, requires: pytest
   pytest plugin to collect allure markers without running any tests

pytest-allure-dsl
   last release: Oct 25, 2020, status: 4 - Beta, requires: pytest
   pytest plugin to test case doc string dls instructions

pytest-allure-id2history
   last release: May 14, 2024, status: 4 - Beta, requires: pytest>=6.2.0
   Overwrite allure history id with testcase full name and testcase id if testcase has id, exclude parameters.

pytest-allure-intersection
   last release: Oct 27, 2022, status: N/A, requires: pytest (<5)

pytest-allure-spec-coverage
   last release: Oct 26, 2021, status: N/A, requires: pytest
   The pytest plugin aimed to display test coverage of the specs(requirements) in Allure

pytest-alphamoon
   last release: Dec 30, 2021, status: 5 - Production/Stable, requires: pytest (>=3.5.0)
   Static code checks used at Alphamoon

pytest-analyzer
   last release: Feb 21, 2024, status: N/A, requires: pytest <8.0.0,>=7.3.1
   this plugin allows to analyze tests in pytest project, collect test metadata and sync it with testomat.io TCM system

pytest-android
   last release: Feb 21, 2019, status: 3 - Alpha, requires: pytest
   This fixture provides a configured “driver” for Android Automated Testing, using uiautomator2.

pytest-anki
   last release: Jul 31, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
   A pytest plugin for testing Anki add-ons

pytest-annotate
   last release: Jun 07, 2022, status: 3 - Alpha, requires: pytest (<8.0.0,>=3.2.0)
   pytest-annotate: Generate PyAnnotate annotations from your pytest tests.

pytest-ansible
   last release: Apr 22, 2024, status: 5 - Production/Stable, requires: pytest>=6
   Plugin for pytest to simplify calling ansible modules from tests or fixtures

pytest-ansible-playbook
   last release: Mar 08, 2019, status: 4 - Beta, requires: N/A
   Pytest fixture which runs given ansible playbook file.

pytest-ansible-playbook-runner
   last release: Dec 02, 2020, status: 4 - Beta, requires: pytest (>=3.1.0)
   Pytest fixture which runs given ansible playbook file.
pytest-ansible-units
last release: Apr 14, 2022, status: N/A, requires: N/A
A pytest plugin for running unit tests within an ansible collection

pytest-antilru
last release: Jul 05, 2022, status: 5 - Production/Stable, requires: pytest
Bust functools.lru_cache when running pytest to avoid test pollution

pytest-anyio
last release: Jun 29, 2021, status: N/A, requires: pytest
The pytest anyio plugin is built into anyio. You don't need this package.

pytest-anything
last release: Jan 18, 2024, status: N/A, requires: pytest
Pytest fixtures to assert anything and something

pytest-aoc
last release: Dec 02, 2023, status: 5 - Production/Stable, requires: pytest ; extra == 'test'
Downloads puzzle inputs for Advent of Code and synthesizes PyTest fixtures

pytest-aoreporter
last release: Jun 27, 2022, status: N/A, requires: N/A

pytest-api
last release: May 12, 2022, status: N/A, requires: pytest (>=7.1.1,<8.0.0)
An ASGI middleware to populate OpenAPI Specification examples from pytest functions

pytest-api-soup
last release: Aug 27, 2022, status: N/A, requires: N/A
Validate multiple endpoints with unit testing using a single source of truth.

pytest-apistellar
last release: Jun 18, 2019, status: N/A, requires: N/A
apistellar plugin for pytest.

pytest-apiver
last release: Jun 21, 2024, status: N/A, requires: pytest

pytest-appengine
last release: Feb 27, 2017, status: N/A, requires: N/A
AppEngine integration that works well with pytest-django

pytest-appium
last release: Dec 05, 2019, status: N/A, requires: N/A
Pytest plugin for appium

pytest-approvaltests
last release: May 08, 2022, status: 4 - Beta, requires: pytest (>=7.0.1)
A plugin to use approvaltests with pytest

pytest-approvaltests-geo
last release: Feb 05, 2024, status: 5 - Production/ Stable, requires: pytest
Extension for ApprovalTests.Pyton specific to geo data verification
pytest Documentation, Release 8.3

pytest-archon
- **last release**: Dec 18, 2023, **status**: 5 - Production/Stable, **requires**: pytest >=7.2
  - Rule your architecture like a real developer

pytest-argus
- **last release**: Jun 24, 2021, **status**: 5 - Production/Stable, **requires**: pytest (>=6.2.4)
  - pyest results collection plugin

pytest-arraydiff
- **last release**: Nov 27, 2023, **status**: 4 - Beta, **requires**: pytest >=4.6
  - pytest plugin to help with comparing array output from tests

pytest-asgi-server
- **last release**: Dec 12, 2020, **status**: N/A, **requires**: pytest (>=5.4.1)
  - Convenient ASGI client/server fixtures for Pytest

pytest-aspec
- **last release**: Dec 20, 2023, **status**: 4 - Beta, **requires**: N/A
  - Arspec format reporter for pytest

pytest-asptest
- **last release**: Apr 28, 2018, **status**: 4 - Beta, **requires**: N/A
  - test Answer Set Programming programs

pytest-assertcount
- **last release**: Oct 23, 2022, **status**: N/A, **requires**: pytest (>=5.0.0)
  - Plugin to count actual number of asserts in pytest

pytest-assertions
- **last release**: Apr 27, 2022, **status**: N/A, **requires**: N/A
  - Pytest Assertions

pytest-assertutil
- **last release**: May 10, 2019, **status**: N/A, **requires**: N/A
  - pytest-assertutil

pytest-assert-utils
- **last release**: Apr 14, 2022, **status**: 3 - Alpha, **requires**: N/A
  - Useful assertion utilities for use with pytest

pytest-assist
- **last release**: Jun 24, 2024, **status**: N/A, **requires**: pytest
  - load testing library

pytest-assume
- **last release**: Jun 24, 2021, **status**: N/A, **requires**: pytest (>=2.7)
  - A pytest plugin that allows multiple failures per test

pytest-assurka
- **last release**: Aug 04, 2022, **status**: N/A, **requires**: N/A
  - A pytest plugin for Assurka Studio
pytest-ast-back-to-python
  last release: Sep 29, 2019, status: 4 - Beta, requires: N/A
  A plugin for pytest devs to view how assertion rewriting recodes the AST

pytest-asteroid
  last release: Aug 15, 2022, status: N/A, requires: pytest (>=6.2.5,<8.0.0)
  PyTest plugin for docker-based testing on database images

pytest-astropy
  last release: Sep 26, 2023, status: 5 - Production/Stable, requires: pytest >=4.6
  Meta-package containing dependencies for testing

pytest-astropy-header
  last release: Sep 06, 2022, status: 3 - Alpha, requires: pytest (>=4.6)
  pytest plugin to add diagnostic information to the header of the test output

pytest-ast-transformer
  last release: May 04, 2019, status: 3 - Alpha, requires: pytest

pytest_async
  last release: Feb 26, 2020, status: N/A, requires: N/A
  pytest-async - Run your coroutine in event loop without decorator

pytest-async-generators
  last release: Jul 05, 2023, status: N/A, requires: N/A
  Pytest fixtures for async generators

pytest-asynccio
  last release: May 19, 2024, status: 4 - Beta, requires: pytest<9,>=7.0.0
  Pytest support for asynccio

pytest-asynccio-cooperative
  last release: Feb 25, 2024, status: N/A, requires: N/A
  Run all your asynchronous tests cooperatively.

pytest-asynccio-network-simulator
  last release: Jul 31, 2018, status: 3 - Alpha, requires: pytest (<3.7.0,>=3.3.2)
  pytest-asyncio-network-simulator: Plugin for pytest for simulator the network in tests

pytest-asynccio-mongodb
  last release: Oct 18, 2017, status: 5 - Production/Stable, requires: pytest (>=2.5.2)
  pytest plugin for async MongoDB

pytest-asynccio-sqlalchemy
  last release: Oct 07, 2021, status: 4 - Beta, requires: pytest (>=6.0.0)
  Database testing fixtures using the SQLAlchemy asyncio API

pytest-atf-allure
  last release: Nov 29, 2023, status: N/A, requires: pytest (>=7.4.2,<8.0.0)
  基于allure-pytest进行自定义

pytest-atomic
  last release: Nov 24, 2018, status: 4 - Beta, requires: N/A
  Skip rest of tests if previous test failed.
pytest-attrib

*last release: May 24, 2016, status: 4 - Beta, requires: N/A*

pytest plugin to select tests based on attributes similar to the nose-attrib plugin

pytest-attributes

*last release: Jun 24, 2024, status: 4 - Beta, requires: pytest>=6.2.0*

A plugin that allows users to add attributes to their tests. These attributes can then be referenced by fixtures or the test itself.

pytest-austin

*last release: Oct 11, 2020, status: 4 - Beta, requires: N/A*

Austin plugin for pytest

pytest-autocap

*last release: May 15, 2022, status: N/A, requires: pytest (<7.2,>=7.1.2)*

automatically capture test & fixture stdout/stderr to files

pytest-autochecklog

*last release: Apr 25, 2015, status: N/A, requires: N/A*

automatically check condition and log all the checks

pytest-automation

*last release: Apr 24, 2024, status: N/A, requires: pytest>=7.0.0*

pytest plugin for building a test suite, using YAML files to extend pytest parameterize functionality.

pytest-automock

*last release: May 16, 2023, status: N/A, requires: pytest ; extra == 'dev'*

Pytest plugin for automatical mocks creation

pytest-auto-parametrize

*last release: Oct 02, 2016, status: 3 - Alpha, requires: N/A*

pytest plugin: avoid repeating arguments in parametrize

pytest-autotest

*last release: Aug 25, 2021, status: N/A, requires: pytest*

This fixture provides a configured “driver” for Android Automated Testing, using uiautomator2.

pytest-aux

*last release: Jun 27, 2024, status: N/A, requires: N/A*

templates/examples and aux for pytest

pytest-aviator

*last release: Nov 04, 2022, status: 4 - Beta, requires: pytest*

Aviator’s Flakybot pytest plugin that automatically reruns flaky tests.

pytest-avoidance

*last release: May 23, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)*

Makes pytest skip tests that don not need rerunning

pytest-aws

*last release: Oct 04, 2017, status: 4 - Beta, requires: N/A*

pytest plugin for testing AWS resource configurations
pytest-aws-apigateway
  last release: May 24, 2024, status: 4 - Beta, requires: pytest
  pytest plugin for AWS ApiGateway

pytest-aws-config
  last release: May 28, 2021, status: N/A, requires: N/A
  Protect your AWS credentials in unit tests

pytest-aws-fixtures
  last release: Feb 02, 2024, status: N/A, requires: pytest (>=8.0.0, <9.0.0)
  A series of fixtures to use in integration tests involving actual AWS services.

pytest-axe
  last release: Nov 12, 2018, status: N/A, requires: pytest (>=3.0.0)
  pytest plugin for axe-selenium-python

pytest-axe-playwright-snapshot
  last release: Jul 25, 2023, status: N/A, requires: pytest
  A pytest plugin that runs Axe-core on Playwright pages and takes snapshots of the results.

pytest-azure
  last release: Jan 18, 2023, status: 3 - Alpha, requires: pytest
  Pytest utilities and mocks for Azure

pytest-azure-devops
  last release: Jun 20, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)

pytest-azurepipelines
  last release: Oct 06, 2023, status: 5 - Production/Stable, requires: pytest (>=5.0.0)
  Formatting PyTest output for Azure Pipelines UI

pytest-bandit
  last release: Feb 23, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)
  A bandit plugin for pytest

pytest-bandit-xayon
  last release: Oct 17, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
  A bandit plugin for pytest

pytest-base-url
  last release: Jan 31, 2024, status: 5 - Production/Stable, requires: pytest>=7.0.0
  pytest plugin for URL based testing

pytest-batch-regression
  last release: May 08, 2024, status: N/A, requires: pytest>=6.0.0
  A pytest plugin to repeat the entire test suite in batches.

pytest-bazel
  last release: Jun 29, 2024, status: 4 - Beta, requires: pytest
  A pytest runner with bazel support
pytest-bdd
   last release: Jun 04, 2024, status: 6 - Mature, requires: pytest>=6.2.0
   BDD for pytest

pytest-bdd-html
   last release: Nov 22, 2022, status: 3 - Alpha, requires: pytest (!=6.0.0,>=5.0)
   pytest plugin to display BDD info in HTML test report

pytest-bdd-ng
   last release: Dec 31, 2023, status: 4 - Beta, requires: pytest >=5.0
   BDD for pytest

pytest-bdd-report
   last release: May 20, 2024, status: N/A, requires: pytest >=7.1.3
   A pytest-bdd plugin for generating useful and informative BDD test reports

pytest-bdd-splinter
   last release: Aug 12, 2019, status: 5 - Production/Stable, requires: pytest (>=4.0.0)
   Common steps for pytest bdd and splinter integration

pytest-bdd-web
   last release: Jan 02, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
   A simple plugin to use with pytest

pytest-bdd-wrappers
   last release: Feb 11, 2020, status: 2 - Pre-Alpha, requires: N/A

pytest-beakerlib
   last release: Mar 17, 2017, status: 5 - Production/Stable, requires: pytest
   A pytest plugin that reports test results to the BeakerLib framework

pytest-beartype
   last release: Jan 25, 2024, status: N/A, requires: pytest
   Pytest plugin to run your tests with beartype checking enabled.

pytest-bec-e2e
   last release: Jun 28, 2024, status: 3 - Alpha, requires: pytest
   BEC pytest plugin for end-to-end tests

pytest-beds
   last release: Jun 07, 2016, status: 4 - Beta, requires: N/A
   Fixtures for testing Google Appengine (GAE) apps

pytest-beeprint
   last release: Jul 04, 2023, status: 4 - Beta, requires: N/A
   use icdiff for better error messages in pytest assertions

pytest-bench
   last release: Jul 21, 2014, status: 3 - Alpha, requires: N/A
   Benchmark utility that plugs into pytest.

pytest-benchmark
   last release: Oct 25, 2022, status: 5 - Production/Stable, requires: pytest (>=3.8)
   A ”pytest” fixture for benchmarking code. It will group the tests into rounds that are calibrated to the chosen timer.
pytest-better-datadir

*last release:* Mar 13, 2023, *status:* N/A, *requires:* N/A

A small example package

pytest-better-parametrize

*last release:* Mar 05, 2024, *status:* 4 - Beta, *requires:* pytest >= 6.2.0

Better description of parametrized test cases

pytest-bg-process

*last release:* Jan 24, 2022, *status:* 4 - Beta, *requires:* pytest (>= 3.5.0)

Pytest plugin to initialize background process

pytest-bigchaindb

*last release:* Jan 24, 2022, *status:* 4 - Beta, *requires:* N/A

A BigchainDB plugin for pytest.

pytest-bigquery-mock

*last release:* Dec 28, 2022, *status:* N/A, *requires:* pytest (>= 5.0)

Provides a mock fixture for python bigquery client

pytest-bisect-tests

*last release:* Jun 09, 2024, *status:* N/A, *requires:* N/A

Find tests leaking state and affecting other

pytest-black

*last release:* Oct 05, 2020, *status:* 4 - Beta, *requires:* N/A

A pytest plugin to enable format checking with black

pytest-black-multipy

*last release:* Jan 14, 2021, *status:* 5 - Production/Stable, *requires:* pytest (!= 3.7.3, >= 3.5); extra == ‘testing’

Allow ‘-black’ on older Pythons

pytest-black-ng

*last release:* Oct 20, 2022, *status:* 4 - Beta, *requires:* pytest (>= 7.0.0)

A pytest plugin to enable format checking with black

pytest-blame

*last release:* May 04, 2019, *status:* N/A, *requires:* pytest (>= 4.4.0)

A pytest plugin helps developers to debug by providing useful commits history.

pytest-blender

*last release:* Aug 10, 2023, *status:* N/A, *requires:* pytest ; extra == ‘dev’

Blender Pytest plugin.

pytest-blank1

*last release:* Jan 07, 2018, *status:* 4 - Beta, *requires:* N/A

Pytest plugin to emit notifications via the Blink(1) RGB LED

pytest-blockage

*last release:* Dec 21, 2021, *status:* N/A, *requires:* pytest

Disable network requests during a test run.
pytest-blocker
  last release: Sep 07, 2015, status: 4 - Beta, requires: N/A
  pytest plugin to mark a test as blocker and skip all other tests

pytest-blue
  last release: Sep 05, 2022, status: N/A, requires: N/A
  A pytest plugin that adds a 'blue' fixture for printing stuff in blue.

pytest-board
  last release: Jan 20, 2019, status: N/A, requires: N/A
  Local continuous test runner with pytest and watchdog.

pytest-boost-xml
  last release: Nov 30, 2022, status: 4 - Beta, requires: N/A
  Plugin for pytest to generate boost xml reports

pytest-bootstrap
  last release: Mar 04, 2022, status: N/A, requires: N/A

pytest-boto-mock
  last release: Jun 05, 2024, status: 5 - Production/Stable, requires: pytest>=8.2.0
  Thin-wrapper around the mock package for easier use with pytest

pytest-bpdb
  last release: Jan 19, 2015, status: 2 - Pre-Alpha, requires: N/A
  A py.test plug-in to enable drop to bpdb debugger on test failure.

pytest-bq
  last release: May 08, 2024, status: 5 - Production/Stable, requires: pytest>=6.2
  BigQuery fixtures and fixture factories for Pytest.

pytest-bravado
  last release: Feb 15, 2022, status: N/A, requires: N/A
  Pytest-bravado automatically generates from OpenAPI specification client fixtures.

pytest-breakword
  last release: Aug 04, 2021, status: N/A, requires: pytest (>=6.2.4,<7.0.0)
  Use breakword with pytest

pytest-breed-adapter
  last release: Nov 07, 2018, status: 4 - Beta, requires: pytest (>=3.5.0)
  A simple plugin to connect with breed-server

pytest-briefcase
  last release: Jun 14, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
  A pytest plugin for running tests on a Briefcase project.

pytest-broadcaster
  last release: Apr 06, 2024, status: 3 - Alpha, requires: pytest
  Pytest plugin to broadcast pytest output to various destinations

pytest-browser
  last release: Dec 10, 2016, status: 3 - Alpha, requires: N/A
  A pytest plugin for console based browser test selection just after the collection phase
pytest-browsermob-proxy
last release: Jun 11, 2013, status: 4 - Beta, requires: N/A
BrowserMob proxy plugin for py.test.

pytest_browserstack
last release: Jan 27, 2016, status: 4 - Beta, requires: N/A
Py.test plugin for BrowserStack

pytest-browserstack-local
last release: Feb 09, 2018, status: N/A, requires: N/A
"py.test" plugin to run "BrowserStackLocal" in background.

pytest-budosystems
last release: May 07, 2023, status: 3 - Alpha, requires: pytest
Budo Systems is a martial arts school management system. This module is the Budo Systems Pytest Plugin.

pytest-bug
last release: Jun 05, 2024, status: 5 - Production/Stable, requires: pytest>=8.0.0
Pytest plugin for marking tests as a bug

pytest-bugtag
last release: Jan 16, 2022, status: N/A, requires: N/A
pytest-bugtag is a plugin for pytest

pytest-bugzilla
last release: May 05, 2010, status: 4 - Beta, requires: N/A
py.test bugzilla integration plugin

pytest-bugzilla-notifier
last release: Jun 15, 2018, status: 4 - Beta, requires: pytest (>=2.9.2)
A plugin that allows you to execute create, update, and read information from BugZilla bugs

pytest-buildkite
last release: Jul 13, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
Plugin for pytest that automatically publishes coverage and pytest report annotations to Buildkite.

pytest-built-in-types
last release: Nov 17, 2021, status: N/A, requires: pytest

pytest-bwrap
last release: Feb 25, 2024, status: 3 - Alpha, requires: N/A
Run your tests in Bubblewrap sandboxes

pytest-cache
last release: Jun 04, 2013, status: 3 - Alpha, requires: N/A
pytest plugin with mechanisms for caching across test runs

pytest-cache-assert
last release: Aug 14, 2023, status: 5 - Production/Stable, requires: pytest (>=6.0.0)
Cache assertion data to simplify regression testing of complex serializable data

pytest-cagoule
last release: Jan 01, 2020, status: 3 - Alpha, requires: N/A
Pytest plugin to only run tests affected by changes
pytest Documentation, Release 8.3

pytest-cairo
    last release: Apr 17, 2022, status: N/A, requires: pytest
    Pytest support for cairo-lang and starknet

pytest-call-checker
    last release: Oct 16, 2022, status: 4 - Beta, requires: pytest (>=7.1.3,<8.0.0)
    Small pytest utility to easily create test doubles

pytest-camel-collect
    last release: Aug 02, 2020, status: N/A, requires: pytest (>=2.9)
    Enable CamelCase-aware pytest class collection

pytest-canonical-data
    last release: May 08, 2020, status: 2 - Pre-Alpha, requires: pytest (>=3.5.0)
    A plugin which allows to compare results with canonical results, based on previous runs

pytest-capture-deprecatedwarnings
    last release: Apr 30, 2019, status: N/A, requires: N/A
    pytest plugin to capture all deprecatedwarnings and put them in one file

pytest-capture-warnings
    last release: May 03, 2022, status: N/A, requires: pytest
    pytest plugin to capture all warnings and put them in one file of your choice

pytest-cases
    last release: Apr 04, 2024, status: 5 - Production/Stable, requires: N/A
    Separate test code from test cases in pytest.

pytest-cassandra
    last release: Nov 04, 2017, status: 1 - Planning, requires: N/A
    Cassandra CCM Test Fixtures for pytest

pytest-catchlog
    last release: Jan 24, 2016, status: 4 - Beta, requires: pytest (>=2.6)
    py.test plugin to catch log messages. This is a fork of pytest-capturelog.

pytest-catch-server
    last release: Dec 12, 2019, status: 5 - Production/Stable, requires: N/A
    Pytest plugin with server for catching HTTP requests.

pytest-celery
    last release: Apr 11, 2024, status: 4 - Beta, requires: N/A
    Pytest plugin for Celery

pytest-cfg-fetcher
    last release: Feb 26, 2024, status: N/A, requires: N/A
    Pass config options to your unit tests.
pytest-chainmaker
  last release: Oct 15, 2021, status: N/A, requires: N/A
  pytest plugin for chainmaker

pytest-chalice
  last release: Jul 01, 2020, status: 4 - Beta, requires: N/A
  A set of py.test fixtures for AWS Chalice

pytest-change-assert
  last release: Oct 19, 2022, status: N/A, requires: N/A
  修改报错中文为英文

pytest-change-demo
  last release: Mar 02, 2022, status: N/A, requires: pytest
turn . into √, turn F into x

pytest-change-report
  last release: Sep 14, 2020, status: N/A, requires: pytest
turn . into √, turn F into x

pytest-change-xds
  last release: Apr 16, 2022, status: N/A, requires: pytest
turn . into √, turn F into x

pytest-chdir
  last release: Jan 28, 2020, status: N/A, requires: pytest (>=5.0.0,<6.0.0)
  A pytest fixture for changing current working directory

pytest-check
  last release: Jan 18, 2024, status: N/A, requires: pytest>=7.0.0
  A pytest plugin that allows multiple failures per test.

pytest-checkdocs
  last release: Apr 30, 2024, status: 5 - Production/Stable, requires: pytest!=8.1.*,>=6; extra == “testing”
  check the README when running tests

pytest-checkipdb
  last release: Dec 04, 2023, status: 5 - Production/Stable, requires: pytest >=2.9.2
  plugin to check if there are ipdb debugs left

pytest-check-library
  last release: Jul 17, 2022, status: N/A, requires: N/A
  check your missing library

pytest-check-libs
  last release: Jul 17, 2022, status: N/A, requires: N/A
  check your missing library

pytest-check-links
  last release: Jul 29, 2020, status: N/A, requires: pytest<9,>=7.0
  Check links in files

3.2. Pytest Plugin List
pytest-checklist
last release: Jun 10, 2024, status: N/A, requires: N/A
Pytest plugin to track and report unit/function coverage.

pytest-check-mk
last release: Nov 19, 2015, status: 4 - Beta, requires: pytest
pytest plugin to test Check_MK checks

pytest-check-requirements
last release: Feb 20, 2024, status: N/A, requires: N/A
A package to prevent Dependency Confusion attacks against Yandex.

pytest-ch-framework
last release: Apr 17, 2024, status: N/A, requires: pytest==8.0.1
My pytest framework

pytest-chic-report
last release: Jan 31, 2023, status: 5 - Production/Stable, requires: N/A
A pytest plugin to send a report and printing summary of tests.

pytest-choose
last release: Feb 04, 2024, status: N/A, requires: pytest >=7.0.0
Provide the pytest with the ability to collect use cases based on rules in text files

pytest-chunks
last release: Jul 05, 2022, status: N/A, requires: pytest (>=6.0.0)
Run only a chunk of your test suite

pytest_cid
last release: Sep 01, 2023, status: 4 - Beta, requires: pytest >= 5.0, < 7.0
Compare data structures containing matching CIDs of different versions and encoding

pytest-circleci
last release: May 03, 2019, status: N/A, requires: N/A
pytest plugin for CircleCI

pytest-circleci-parallelized
last release: Oct 20, 2022, status: N/A, requires: N/A
Parallelize pytest across CircleCI workers.

pytest-circleci-parallelized-rjp
last release: Jun 21, 2022, status: N/A, requires: pytest
Parallelize pytest across CircleCI workers.

pytest-ckan
last release: Apr 28, 2020, status: 4 - Beta, requires: pytest
Backport of CKAN 2.9 pytest plugin and fixtures to CAKN 2.8

pytest-clarity
last release: Jun 11, 2021, status: N/A, requires: N/A
A plugin providing an alternative, colourful diff output for failing assertions.
pytest-cldf
   last release: Nov 07, 2022, status: N/A, requires: pytest (>=3.6)
   Easy quality control for CLDF datasets using pytest

pytest-cleanslate
   last release: Jun 17, 2024, status: N/A, requires: pytest
   Collects and executes pytest tests separately

pytest_cleanup
   last release: Jan 28, 2020, status: N/A, requires: N/A
   Automated, comprehensive and well-organised pytest test cases.

pytest-cleantotal
   last release: Mar 19, 2024, status: 5 - Production/Stable, requires: N/A
   A cleanup plugin for pytest

pytest-clerk
   last release: Jun 27, 2024, status: N/A, requires: pytest<9.0.0,>=8.0.0
   A set of pytest fixtures to help with integration testing with Clerk.

pytest-click
   last release: Feb 11, 2022, status: 5 - Production/Stable, requires: pytest (>=5.0)
   Pytest plugin for Click

pytest-cleifi-gxtures
   last release: Jul 28, 2022, status: N/A, requires: pytest (<=7.0)
   Automatically register fixtures for custom CLI arguments

pytest-clld
   last release: Jul 06, 2022, status: N/A, requires: pytest (>=3.6)

pytest-cloud
   last release: Oct 05, 2020, status: 6 - Mature, requires: N/A
   Distributed tests planner plugin for pytest testing framework.

pytest-cloudflare-worker
   last release: Mar 30, 2021, status: 4 - Beta, requires: pytest (>=6.0.0)
   pytest plugin for testing cloudflare workers

pytest-cloudist
   last release: Sep 02, 2022, status: 4 - Beta, requires: pytest (>=7.1.2,<8.0.0)
   Distribute tests to cloud machines without fuss

pytest-cmake
   last release: May 31, 2024, status: N/A, requires: pytest<9,>=4
   Provide CMake module for Pytest

pytest-cmake-presets
   last release: Dec 26, 2022, status: N/A, requires: pytest (>=7.2.0,<8.0.0)
   Execute CMake Presets via pytest

pytest-cobra
   last release: Jun 29, 2019, status: 3 - Alpha, requires: pytest (<4.0.0,>=3.7.1)
   PyTest plugin for testing Smart Contracts for Ethereum blockchain.
pytest_codeblocks
  last release: Sep 17, 2023, status: 5 - Production/Stable, requires: pytest >= 7.0.0
  Test code blocks in your READMEs

pytest-codecarbon
  last release: Jun 15, 2022, status: N/A, requires: pytest
  Pytest plugin for measuring carbon emissions

pytest-codecheckers
  last release: Feb 13, 2010, status: N/A, requires: N/A
  pytest plugin to add source code sanity checks (pep8 and friends)

pytest-codecov
  last release: Nov 29, 2022, status: 4 - Beta, requires: pytest (>=4.6.0)
  Pytest plugin for uploading pytest-cov results to codecov.io

pytest-codegen
  last release: Aug 23, 2020, status: 2 - Pre-Alpha, requires: N/A
  Automatically create pytest test signatures

pytest-codeowners
  last release: Mar 30, 2022, status: 4 - Beta, requires: pytest (>=6.0.0)
  Pytest plugin for selecting tests by GitHub CODEOWNERS.

pytest-codestyle
  last release: Mar 23, 2020, status: 3 - Alpha, requires: N/A
  pytest plugin to run pycodestyle

pytest-codspeed
  last release: Mar 19, 2024, status: 5 - Production/Stable, requires: pytest>=3.8
  Pytest plugin to create CodSpeed benchmarks

pytest-collect-appoint-info
  last release: Aug 03, 2023, status: N/A, requires: pytest
  set your encoding

pytest-collect-formatter
  last release: Mar 29, 2021, status: 5 - Production/Stable, requires: N/A
  Formatter for pytest collect output

pytest-collect-formatter2
  last release: May 31, 2021, status: 5 - Production/Stable, requires: N/A
  Formatter for pytest collect output

pytest-collect-interface-info-plugin
  last release: Sep 25, 2023, status: 4 - Beta, requires: N/A
  Get executed interface information in pytest interface automation framework

pytest-collector
  last release: Aug 02, 2022, status: N/A, requires: pytest (>=7.0,<8.0)
  Python package for collecting pytest.
pytest-collect-pytest-interinfo
   last release: Sep 26, 2023, status: 4 - Beta, requires: N/A
   A simple plugin to use with pytest

pytest-colordots
   last release: Oct 06, 2017, status: 5 - Production/Stable, requires: N/A
   Colorizes the progress indicators

pytest-commander
   last release: Aug 17, 2021, status: N/A, requires: pytest (<7.0.0,>=6.2.4)
   An interactive GUI test runner for PyTest

pytest-common-subject
   last release: Jun 12, 2024, status: N/A, requires: pytest<9,>=3.6
   pytest framework for testing different aspects of a common method

pytest-compare
   last release: Jun 22, 2023, status: 5 - Production/Stable, requires: N/A
   pytest plugin for comparing call arguments.

pytest-concurrent
   last release: Jan 12, 2019, status: 4 - Beta, requires: pytest (>=3.1.1)
   Concurrently execute test cases with multithread, multiprocess and gevent

pytest-config
   last release: Nov 07, 2014, status: 5 - Production/Stable, requires: N/A
   Base configurations and utilities for developing your Python project test suite with pytest.

pytest-confluence-report
   last release: Apr 17, 2022, status: N/A, requires: N/A
   Package stands for pytest plugin to upload results into Confluence page.

pytest-console-scripts
   last release: May 31, 2023, status: 4 - Beta, requires: pytest (>=4.0.0)
   Pytest plugin for testing console scripts

pytest-consul
   last release: Nov 24, 2018, status: 3 - Alpha, requires: pytest
   pytest plugin with fixtures for testing consul aware apps

pytest-container
   last release: Apr 10, 2024, status: 4 - Beta, requires: pytest>=3.10
   Pytest fixtures for writing container based tests

pytest-contextfixture
   last release: Mar 12, 2013, status: 4 - Beta, requires: N/A
   Define pytest fixtures as context managers.

pytest-contexts
   last release: May 19, 2021, status: 4 - Beta, requires: N/A
   A plugin to run tests written with the Contexts framework using pytest

3.2. Pytest Plugin List
pytest-continuous

[last release: Apr 23, 2024, status: N/A, requires: N/A]
A pytest plugin to run tests continuously until failure or interruption.

pytest-cookies

[last release: Mar 22, 2023, status: 5 - Production/Stable, requires: pytest (>=3.9.0)]
The pytest plugin for your Cookiecutter templates.

pytest-copie

[last release: Jun 26, 2024, status: 3 - Alpha, requires: pytest]
The pytest plugin for your copier templates

pytest-copier

[last release: Dec 11, 2023, status: 4 - Beta, requires: pytest>=7.3.2]
A pytest plugin to help testing Copier templates

pytest-couchdbkit

[last release: Apr 17, 2012, status: N/A, requires: N/A]
pytest extension for per-test couchdb databases using couchdbkit

pytest-count

[last release: Jan 12, 2018, status: 4 - Beta, requires: N/A]
count errors and send email

pytest-cov

[last release: Mar 24, 2024, status: 5 - Production/Stable, requires: pytest>=4.6]
Pytest plugin for measuring coverage.

pytest-cover

[last release: Aug 01, 2015, status: 5 - Production/Stable, requires: N/A]
Pytest plugin for measuring coverage. Forked from `pytest-cov`.

pytest-coverage

[last release: Jun 17, 2015, status: N/A, requires: N/A]

pytest-coverage-context

[last release: Jun 28, 2023, status: 4 - Beta, requires: N/A]
Coverage dynamic context support for PyTest, including sub-processes

pytest-coveragemarkers

[last release: Jun 04, 2024, status: N/A, requires: pytest<8.0.0,>=7.1.2]
Using pytest markers to track functional coverage and filtering of tests

pytest-cov-exclude

[last release: Apr 29, 2016, status: 4 - Beta, requires: pytest (>=2.8.0,<2.9.0); extra == `dev`]
Pytest plugin for excluding tests based on coverage data

pytest_covid

[last release: Jun 24, 2020, status: N/A, requires: N/A]
Too many failure, less tests.

pytest-cpp

[last release: Nov 01, 2023, status: 5 - Production/Stable, requires: pytest >=7.0]
Use pytest’s runner to discover and execute C++ tests

pytest Documentation, Release 8.3

pytest-custom-exit-code
last release: Aug 07, 2019, status: 4 - Beta, requires: pytest (>=4.0.2)
Exit pytest test session with custom exit code in different scenarios

pytest-custom-nodeid
last release: Mar 07, 2021, status: N/A, requires: N/A
Custom grouping for pytest-xdist, rename test cases name and test cases nodeid, support allure report

pytest-custom-outputs
last release: Jun 28, 2024, status: 4 - Beta, requires: pytest>=6.2.0
A plugin that allows users to create and use custom outputs instead of the standard Pass and Fail. Also allows users to retrieve test results in fixtures.

pytest-custom-report
last release: Jan 30, 2019, status: N/A, requires: pytest
Configure the symbols displayed for test outcomes

pytest-custom-scheduling
last release: Mar 01, 2021, status: N/A, requires: N/A
Custom grouping for pytest-xdist, rename test cases name and test cases nodeid, support allure report

pytest-cython
last release: Apr 05, 2024, status: 5 - Production/ Stable, requires: pytest>=8
A plugin for testing Cython extension modules

pytest-cython-collect
last release: Jun 17, 2022, status: N/A, requires: pytest

pytest-dark
last release: Feb 25, 2024, status: N/A, requires: pytest <7,>=6.0.1
A pytest plugin for checking of modified code using Darker

pytest-dash
last release: Mar 18, 2019, status: N/A, requires: N/A
pytest fixtures to run dash applications.

pytest-dashboard
last release: May 30, 2024, status: N/A, requires: pytest<8.0.0,>=7.4.3

pytest-data
last release: Nov 01, 2016, status: 5 - Production/ Stable, requires: N/A
Useful functions for managing data for pytest fixtures

pytest-databases
last release: Jun 11, 2024, status: 4 - Beta, requires: pytest
Reusable database fixtures for any and all databases.

pytest-databricks
last release: Jul 29, 2020, status: N/A, requires: pytest
Pytest plugin for remote Databricks notebooks testing

pytest-datadir
last release: Oct 03, 2023, status: 5 - Production/ Stable, requires: pytest >=5.0
pytest plugin for test data directories and files
pytest-datadir-mgr
- **last release**: Apr 06, 2023, **status**: 5 - Production/Stable, **requires**: pytest (>=7.1)
  Manager for test data: downloads, artifact caching, and a tmpdir context.

pytest-datadir-ng
- **last release**: Dec 25, 2019, **status**: 5 - Production/Stable, **requires**: pytest
  Fixtures for pytest allowing test functions/methods to easily retrieve test resources from the local filesystem.

pytest-datadir-nng
- **last release**: Nov 09, 2022, **status**: 5 - Production/Stable, **requires**: pytest (>7.0.0,<8.0.0)
  Fixtures for pytest allowing test functions/methods to easily retrieve test resources from the local filesystem.

pytest-data-extractor
- **last release**: Jul 19, 2022, **status**: N/A, **requires**: pytest (>=7.0.1)
  A pytest plugin to extract relevant metadata about tests into an external file (currently only json support)

pytest-data-file
- **last release**: Dec 04, 2019, **status**: N/A, **requires**: N/A
  Fixture “data” and “case_data” for test from yaml file

pytest-datafiles
- **last release**: Feb 24, 2023, **status**: 5 - Production/Stable, **requires**: pytest (>=3.6)
  py.test plugin to create a 'tmp_path' containing predefined files/directories.

pytest-datafixtures
- **last release**: Dec 05, 2020, **status**: 5 - Production/Stable, **requires**: N/A
  Data fixtures for pytest made simple

pytest-data-from-files
- **last release**: Oct 13, 2021, **status**: 4 - Beta, **requires**: pytest
  pytest plugin to provide data from files loaded automatically

pytest-dataplugin
- **last release**: Sep 16, 2017, **status**: 1 - Planning, **requires**: N/A
  A pytest plugin for managing an archive of test data.

pytest-datarecorder
- **last release**: Feb 15, 2024, **status**: 5 - Production/Stable, **requires**: pytest
  A py.test plugin recording and comparing test output.

pytest-dataset
- **last release**: Sep 01, 2023, **status**: 5 - Production/Stable, **requires**: N/A
  Plugin for loading different datasets for pytest by prefix from json or yaml files

pytest-data-suites
- **last release**: Apr 06, 2024, **status**: N/A, **requires**: pytest<9.0,>=6.0
  Class-based pytest parametrization

pytest-datatest
- **last release**: Oct 15, 2020, **status**: 4 - Beta, **requires**: pytest (>=3.3)
  A pytest plugin for test driven data-wrangling (this is the development version of datatest’s pytest integration).
pytest Documentation, Release 8.3

pytest-db
  last release: Dec 04, 2019, status: N/A, requires: N/A
  Session scope fixture “db” for mysql query or change

pytest-dbfixtures
  last release: Dec 07, 2016, status: 4 - Beta, requires: N/A
  Databases fixtures plugin for py.test.

pytest-db-plugin
  last release: Nov 27, 2021, status: N/A, requires: pytest (>=5.0)

pytest-db
  last release: Jun 08, 2023, status: 2 - Pre-Alpha, requires: pytest (>=7.0.0,<8.0.0)
  Unit test dbt models with standard python tooling

pytest-db-adapter
  last release: Nov 24, 2021, status: N/A, requires: pytest (<7,>=6)
  A pytest plugin for testing dbt adapter plugins

pytest-db-conventions
  last release: Mar 02, 2022, status: N/A, requires: pytest (>=6.2.5,<7.0.0)
  A pytest plugin for linting a dbt project's conventions

pytest-db-core
  last release: Jun 04, 2024, status: N/A, requires: pytest>=6.2.5; extra == “test”
  Pytest extension for dbt.

pytest-db-postgres
  last release: Jan 02, 2024, status: N/A, requires: pytest (>=7.4.3,<8.0.0)
  Pytest tooling to unitest DBT & Postgres models

pytest-dbus-notification
  last release: Mar 05, 2014, status: 5 - Production/Stable, requires: N/A
  D-BUS notifications for pytest results.

pytest-dbx
  last release: Nov 29, 2022, status: N/A, requires: pytest (>=7.1.3,<8.0.0)
  Pytest plugin to run unit tests for dbx (Databricks CLI extensions) related code

pytest-dc
  last release: Aug 16, 2023, status: 5 - Production/Stable, requires: pytest >=3.3
  Manages Docker containers during your integration tests

pytest-deadfixtures
  last release: Jul 23, 2020, status: 5 - Production/Stable, requires: N/A
  A simple plugin to list unused fixtures in pytest

pytest-deduplicate
  last release: Aug 12, 2023, status: 4 - Beta, requires: pytest
  Identifies duplicate unit tests

pytest-deepcov
  last release: Mar 30, 2021, status: N/A, requires: N/A
  deepcov
pytest-defer
  last release: Aug 24, 2021, status: N/A, requires: N/A

pytest-demo-plugin
  last release: May 15, 2021, status: N/A, requires: N/A

pytest-dependency
  last release: Dec 31, 2023, status: 4 - Beta, requires: N/A

  Manage dependencies of tests

pytest-depends
  last release: Apr 05, 2020, status: 5 - Production/Stable, requires: pytest (>=3)

  Tests that depend on other tests

pytest-deprecate
  last release: Jul 01, 2019, status: N/A, requires: N/A

  Mark tests as testing a deprecated feature with a warning note.

pytest-describe
  last release: Feb 10, 2024, status: 5 - Production/Stable, requires: pytest <9,>=4.6

  Describe-style plugin for pytest

pytest-describe-it
  last release: Jul 19, 2019, status: 4 - Beta, requires: pytest

  plugin for rich text descriptions

pytest-deselect-if
  last release: Mar 24, 2024, status: 4 - Beta, requires: pytest>=6.2.0

  A plugin to deselect pytest tests rather than using skipif

pytest-devpi-server
  last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest

  DevPI server fixture for py.test

pytest-dhos
  last release: Sep 07, 2022, status: N/A, requires: N/A

  Common fixtures for pytest in DHOS services and libraries

pytest-diamond
  last release: Aug 31, 2015, status: 4 - Beta, requires: N/A

  pytest plugin for diamond

pytest-dicom
  last release: Dec 19, 2018, status: 3 - Alpha, requires: pytest

  pytest plugin to provide DICOM fixtures

pytest-dictsdiff
  last release: Jul 26, 2019, status: N/A, requires: N/A

pytest-diff
  last release: Mar 30, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)

  A simple plugin to use with pytest
A package to prevent Dependency Confusion attacks against Yandex.

Get tests affected by code changes (using git)

PyTest plugin for generating Difido reports

pytest-diff-equals is a pytest plugin providing helpers to assert directories equality allowing golden testing

pytest plugin to disable a test and skip it from testrun

Disable plugins per test

A pytest plugin to notify test results to a Discord channel.

Pytest plugin to record discovered tests in a file

Snapshot testing pytest plugin with minimal ceremony and flexible persistence formats.

pytest-ditto plugin for pandas snapshots.

pytest-ditto plugin for pyarrow tables.

A Django plugin for pytest.

A Django plugin for pytest.
pytest-djangoapp

*last release:* May 19, 2023, *status:* 4 - Beta, *requires:* pytest

Nice pytest plugin to help you with Django pluggable application testing.

pytest-django-cache-xdist

*last release:* May 12, 2020, *status:* 4 - Beta, *requires:* N/A

A django-cachexdist plugin for pytest

pytest-django-casperjs

*last release:* Mar 15, 2015, *status:* 2 - Pre-Alpha, *requires:* N/A

Integrate CasperJS with your django tests as a pytest fixture.

pytest-django-class

*last release:* Aug 08, 2023, *status:* 4 - Beta, *requires:* N/A

A pytest plugin for running django in class-scoped fixtures

pytest-django-docker-pg

*last release:* Jun 13, 2024, *status:* 5 - Production/Stable, *requires:* pytest<9.0.0,>=7.0.0

pytest-django-dotenv

*last release:* Nov 26, 2019, *status:* 4 - Beta, *requires:* pytest (>=2.6.0)

Pytest plugin used to setup environment variables with django-dotenv

pytest-django-factories

*last release:* Nov 12, 2020, *status:* 4 - Beta, *requires:* N/A

Factories for your Django models that can be used as Pytest fixtures.

pytest-django-filefield

*last release:* May 09, 2022, *status:* 5 - Production/Stable, *requires:* pytest >= 5.2

Replaces FileField.storage with something you can patch globally.

pytest-django-gcir

*last release:* Mar 06, 2018, *status:* 5 - Production/Stable, *requires:* N/A

A Django plugin for pytest.

pytest-django-haystack

*last release:* Sep 03, 2017, *status:* 5 - Production/Stable, *requires:* pytest (>=2.3.4)

Cleanup your Haystack indexes between tests

pytest-django-ifactory

*last release:* Aug 27, 2023, *status:* 5 - Production/Stable, *requires:* N/A

A model instance factory for pytest-django

pytest-django-lite

*last release:* Jan 30, 2014, *status:* N/A, *requires:* N/A

The bare minimum to integrate py.test with Django.

pytest-django-liveserver-ssl

*last release:* Jan 20, 2022, *status:* 3 - Alpha, *requires:* N/A

pytest-django-model

*last release:* Feb 14, 2019, *status:* 4 - Beta, *requires:* N/A

A Simple Way to Test your Django Models
pytest-django-ordering
  last release: Jul 25, 2019, status: 5 - Production/Stable, requires: pytest (>=2.3.0)

A pytest plugin for preserving the order in which Django runs tests.

pytest-django-queries
  last release: Mar 01, 2021, status: N/A, requires: N/A

Generate performance reports from your django database performance tests.

pytest-djangorestframework
  last release: Aug 11, 2019, status: 4 - Beta, requires: N/A

A djangorestframework plugin for pytest.

pytest-django-rq
  last release: Apr 13, 2020, status: 4 - Beta, requires: N/A

A pytest plugin to help writing unit test for django-rq

pytest-django-sqlcounts
  last release: Jun 16, 2015, status: 4 - Beta, requires: N/A

py.test plugin for reporting the number of SQLs executed per django testcase.

pytest-django-testing-postgresql
  last release: Jan 31, 2022, status: 4 - Beta, requires: N/A

Use a temporary PostgreSQL database with pytest-django

pytest-doc
  last release: Jun 28, 2015, status: 5 - Production/Stable, requires: N/A

A documentation plugin for py.test.

pytest-docfiles
  last release: Dec 22, 2021, status: 4 - Beta, requires: py.test (>=3.7.0)

pytest plugin to test codeblocks in your documentation.

pytest-docgen
  last release: Apr 17, 2020, status: N/A, requires: N/A

An RST Documentation Generator for pytest-based test suites

pytest-docker
  last release: Feb 02, 2024, status: N/A, requires: pytest <9.0,>=4.0

Simple pytest fixtures for Docker and Docker Compose based tests

pytest-docker-apache-fixtures
  last release: Feb 16, 2022, status: 4 - Beta, requires: pytest

Pytest fixtures for testing with apache2 (httpd).

pytest-docker-butla
  last release: Jun 16, 2019, status: 3 - Alpha, requires: N/A

pytest-dockerc
  last release: Oct 09, 2020, status: 5 - Production/Stable, requires: pytest (>=3.0)

Run, manage and stop Docker Compose project from Docker API

pytest-docker-compose
  last release: Jan 26, 2021, status: 5 - Production/Stable, requires: pytest (>=3.3)

Manages Docker containers during your integration tests
pytest-docker-compose-v2
   last release: Feb 28, 2024, status: 4 - Beta, requires: pytest<8,>=7.2.2
   Manages Docker containers during your integration tests

pytest-docker-db
   last release: Mar 20, 2021, status: 5 - Production/Stable, requires: pytest (>=3.1.1)
   A plugin to use docker databases for pytests

pytest-docker-fixtures
   last release: Apr 03, 2024, status: 3 - Alpha, requires: N/A
   pytest docker fixtures

pytest-docker-git-fixtures
   last release: Feb 09, 2022, status: 4 - Beta, requires: pytest
   Pytest fixtures for testing with git scm.

pytest-docker-haproxy-fixtures
   last release: Feb 09, 2022, status: 4 - Beta, requires: pytest
   Pytest fixtures for testing with haproxy.

pytest-docker-pexpect
   last release: Jan 14, 2019, status: N/A, requires: pytest
   pytest plugin for writing functional tests with pexpect and docker

pytest-docker-postgresql
   last release: Sep 24, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
   A simple plugin to use with pytest

pytest-docker-py
   last release: Nov 27, 2018, status: N/A, requires: pytest (==4.0.0)
   Easy to use, simple to extend, pytest plugin that minimally leverages docker-py.

pytest-docker-registry-fixtures
   last release: Apr 08, 2022, status: 4 - Beta, requires: pytest
   Pytest fixtures for testing with docker registries.

pytest-docker-service
   last release: Jan 03, 2024, status: 3 - Alpha, requires: pytest (>=7.1.3)
   pytest plugin to start docker container

pytest-docker-squid-fixtures
   last release: Feb 09, 2022, status: 4 - Beta, requires: pytest
   Pytest fixtures for testing with squid.

pytest-docker-tools
   last release: Feb 17, 2022, status: 4 - Beta, requires: pytest (>=6.0.1)
   Docker integration tests for pytest

pytest-docs
   last release: Nov 11, 2018, status: 4 - Beta, requires: pytest (>=3.5.0)
   Documentation tool for pytest
pytest-docstyle
   last release: Mar 23, 2020, status: 3 - Alpha, requires: N/A
   pytest plugin to run pydocstyle

pytest-doctest-custom
   last release: Jul 25, 2016, status: 4 - Beta, requires: N/A
   A pytest plugin for customizing string representations of doctest results.

pytest-doctest-ellipsis-markers
   last release: Jan 12, 2018, status: 4 - Beta, requires: N/A
   Setup additional values for ELLIPSIS_MARKER for doctests

pytest-doctest-import
   last release: Nov 02, 2014, status: 4 - Beta, requires: pytest (>=3.3.0)
   A simple pytest plugin to import names and add them to the doctest namespace.

pytest-doctest-mkdocstrings
   last release: Mar 02, 2024, status: N/A, requires: pytest
   Run pytest -doctest-modules with markdown docstrings in code blocks (```

pytest-doctestplus
   last release: Mar 10, 2024, status: 5 - Production/ Stable, requires: pytest >=4.6
   Pytest plugin with advanced doctest features.

pytest-dogu-report
   last release: Jul 07, 2023, status: N/A, requires: N/A
   pytest plugin for dogu report

pytest-dogu-sdk
   last release: Dec 14, 2023, status: N/A, requires: N/A
   pytest plugin for the Dogu

pytest-dolphin
   last release: Nov 30, 2016, status: 4 - Beta, requires: pytest (>=3.0.4)
   Some extra stuff that we use in internally

pytest-donde
   last release: Oct 01, 2023, status: 4 - Beta, requires: pytest >=7.3.1
   record pytest session characteristics per test item (coverage and duration) into a persistent file and use them in your own plugin or script.

pytest-doorstop
   last release: Nov 09, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
   A pytest plugin for adding test results into doorstop items.

pytest-dotenv
   last release: Jun 16, 2020, status: 4 - Beta, requires: pytest (>=5.0.0)
   A py.test plugin that parses environment files before running tests

pytest-dot-only-pkcoley
   last release: Oct 27, 2023, status: N/A, requires: N/A
   A Pytest marker for only running a single test
pytest-draw
last release: Mar 21, 2023, status: 3 - Alpha, requires: pytest
Pytest plugin for randomly selecting a specific number of tests

pytest-drf
last release: Jul 12, 2022, status: 5 - Production/Stable, requires: pytest (>=3.7)
A Django REST framework plugin for pytest.

pytest-drivings
last release: Jan 13, 2021, status: N/A, requires: N/A
Tool to allow webdriver automation to be ran locally or remotely

pytest-drop-dup-tests
last release: Mar 04, 2024, status: 5 - Production/Stable, requires: pytest >=7
A Pytest plugin to drop duplicated tests during collection

pytest-dryrun
last release: Jul 18, 2023, status: 5 - Production/Stable, requires: pytest (>=7.4.0,<8.0.0)
A Pytest plugin to ignore tests during collection without reporting them in the test summary.

pytest-dummynet
last release: Dec 15, 2021, status: 5 - Production/Stable, requires: pytest
A py.test plugin providing access to a dummynet.

pytest-dump2json
last release: Jun 29, 2015, status: N/A, requires: N/A
A pytest plugin for dumping test results to json.

pytest-duration-insights
last release: Jun 25, 2021, status: N/A, requires: N/A

pytest-durations
last release: Apr 22, 2022, status: 5 - Production/Stable, requires: pytest (>=4.6)
Pytest plugin reporting fixtures and test functions execution time.

pytest-dynamicrerun
last release: Aug 15, 2020, status: 4 - Beta, requires: N/A
A pytest plugin to rerun tests dynamically based off of test outcome and output.

pytest-dynamodb
last release: Mar 12, 2024, status: 5 - Production/Stable, requires: pytest
DynamoDB fixtures for pytest

pytest-easy-addoption
last release: Jan 22, 2020, status: N/A, requires: N/A
pytest-easy-addoption: Easy way to work with pytest addoption

pytest-easy-api
last release: Feb 16, 2024, status: N/A, requires: N/A
A package to prevent Dependency Confusion attacks against Yandex.

pytest-easyMPI
last release: Oct 21, 2020, status: N/A, requires: N/A
Package that supports mpi tests in pytest
pytest-easyread
  last release: Nov 17, 2017, status: N/A, requires: N/A
  pytest plugin that makes terminal printouts of the reports easier to read

pytest-easy-server
  last release: May 01, 2021, status: 4 - Beta, requires: pytest (<5.0.0,>=4.3.1) ; python_version < “3.5”
  Pytest plugin for easy testing against servers

pytest-ebics-sandbox
  last release: Aug 15, 2022, status: N/A, requires: N/A
  A pytest plugin for testing against an EBICS sandbox server. Requires docker.

pytest-ec2
  last release: Oct 22, 2019, status: 3 - Alpha, requires: N/A
  Pytest execution on EC2 instance

pytest-echo
  last release: Dec 05, 2023, status: 5 - Production/Stable, requires: pytest >=2.2
  pytest plugin with mechanisms for echoing environment variables, package version and generic attributes

pytest-edit
  last release: Jun 09, 2024, status: N/A, requires: pytest
  Edit the source code of a failed test with 'pytest –edit'.

pytest-ekstazi
  last release: Sep 10, 2022, status: N/A, requires: pytest
  Pytest plugin to select test using Ekstazi algorithm

pytest-elasticsearch
  last release: Mar 15, 2024, status: 5 - Production/Stable, requires: pytest >=7.0
  Elasticsearch fixtures and fixture factories for Pytest.

pytest-elements
  last release: Jan 13, 2021, status: N/A, requires: pytest (>=5.4,<6.0)
  Tool to help automate user interfaces

pytest-eliot
  last release: Aug 31, 2022, status: 1 - Planning, requires: pytest (>=5.4.0)
  An eliot plugin for pytest.

pytest-elk-reporter
  last release: Apr 04, 2024, status: 4 - Beta, requires: pytest>=3.5.0
  A simple plugin to use with pytest

pytest-email
  last release: Jul 08, 2020, status: N/A, requires: pytest
  Send execution result email

pytest-embedded
  last release: May 31, 2024, status: 5 - Production/Stable, requires: pytest>=7.0
  A pytest plugin that designed for embedded testing.
pytest-embedded-arduino

Last release: May 23, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with Arduino.

pytest-embedded-idf

Last release: May 23, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with ESP-IDF.

pytest-embedded-jtag

Last release: May 23, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with JTAG.

pytest-embedded-qemu

Last release: May 23, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with QEMU.

pytest-embedded-serial

Last release: May 31, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with Serial.

pytest-embedded-serial-esp

Last release: May 31, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with Espressif target boards.

pytest-embedded-wokwi

Last release: May 23, 2024, status: 5 - Production/Stable, requires: N/A

Make pytest-embedded plugin work with the Wokwi CLI.

pytest-embrace

Last release: Mar 25, 2023, status: N/A, requires: pytest (>=7.0,<8.0)

Heart: Dataclasses-as-tests. Describe the runtime once and multiply coverage with no boilerplate.

pytest-emoji

Last release: Feb 19, 2019, status: 4 - Beta, requires: pytest (>=4.2.1)

A pytest plugin that adds emojis to your test result report.

pytest-emoji-output

Last release: Apr 09, 2023, status: 4 - Beta, requires: pytest (>=7.0.1)

Pytest plugin to represent test output with emoji support.

pytest-enabler

Last release: Mar 21, 2024, status: 5 - Production/Stable, requires: pytest>=6; extra == "testing"

Enable installed pytest plugins.

pytest-encode

Last release: Nov 06, 2021, status: N/A, requires: N/A

Set your encoding and logger.

pytest-encode-kane

Last release: Nov 16, 2021, status: N/A, requires: pytest

Set your encoding and logger.

3.2. Pytest Plugin List
pytest-encoding
  last release: Aug 11, 2023, status: N/A, requires: pytest
  set your encoding and logger

pytest_energy_reporter
  last release: Mar 28, 2024, status: 3 - Alpha, requires: pytest<9.0.0,>=8.1.1
  An energy estimation reporter for pytest

pytest-enhanced-reports
  last release: Dec 15, 2022, status: N/A, requires: N/A
  Enhanced test reports for pytest

pytest-enhancements
  last release: Oct 30, 2019, status: 4 - Beta, requires: N/A
  Improvements for pytest (rejected upstream)

pytest-env
  last release: Nov 28, 2023, status: 5 - Production/Stable, requires: pytest>=7.4.3
  pytest plugin that allows you to add environment variables.

pytest-envfiles
  last release: Oct 08, 2015, status: 3 - Alpha, requires: N/A
  A py.test plugin that parses environment files before running tests

pytest-env-info
  last release: Nov 25, 2017, status: 4 - Beta, requires: pytest (>=3.1.1)
  Push information about the running pytest into envvars

pytest-environment
  last release: Mar 17, 2024, status: 1 - Planning, requires: N/A
  Pytest Environment

pytest-envraw
  last release: Aug 27, 2020, status: 4 - Beta, requires: pytest (>=2.6.0)
  py.test plugin that allows you to add environment variables.

pytest-envvars
  last release: Jun 13, 2020, status: 5 - Production/Stable, requires: pytest (>=3.0.0)
  Pytest plugin to validate use of envvars on your tests

pytest-env-yaml
  last release: Apr 02, 2019, status: N/A, requires: N/A

pytest-eradicate
  last release: Sep 08, 2020, status: N/A, requires: pytest (>=2.4.2)
  pytest plugin to check for commented out code

pytest_erp
  last release: Jan 13, 2015, status: N/A, requires: N/A
  py.test plugin to send test info to report portal dynamically

pytest-error-for-skips
  last release: Dec 19, 2019, status: 4 - Beta, requires: pytest (>=4.6)
  Pytest plugin to treat skipped tests a test failure
pytest-eth
  last release: Aug 14, 2020, status: 1 - Planning, requires: N/A
  PyTest plugin for testing Smart Contracts for Ethereum Virtual Machine (EVM).

pytest-ethereum
  last release: Jun 24, 2019, status: 3 - Alpha, requires: pytest (==3.3.2); extra == ‘dev’
  pytest-ethereum: Pytest library for ethereum projects.

pytest-eucalyptus
  last release: Jun 28, 2022, status: N/A, requires: pytest (>=4.2.0)
  Pytest Plugin for BDD

pytest-eventlet
  last release: Oct 04, 2021, status: N/A, requires: pytest ; extra == ‘dev’
  Applies eventlet monkey-patch as a pytest plugin.

pytest-evm
  last release: Apr 22, 2024, status: 4 - Beta, requires: pytest<9.0.0,>=8.1.1
  The testing package containing tools to test Web3-based projects

pytest_exact_fixtures
  last release: Feb 04, 2019, status: N/A, requires: N/A
  Parse queries in Lucene and Elasticsearch syntaxes

pytest-examples
  last release: Jul 11, 2023, status: 4 - Beta, requires: pytest>=7
  Pytest plugin for testing examples in docstrings and markdown files.

pytest-exasol-ite
  last release: Feb 15, 2024, status: N/A, requires: pytest (>=7,<9)

pytest-exasol-saas
  last release: Jun 07, 2024, status: N/A, requires: pytest<9,>=7

pytest-excel
  last release: Jun 18, 2024, status: 5 - Production/ Stable, requires: pytest>3.6
  pytest plugin for generating excel reports

pytest-exceptional
  last release: Mar 16, 2017, status: 4 - Beta, requires: N/A
  Better exceptions

pytest-exception-script
  last release: Aug 04, 2020, status: 3 - Alpha, requires: pytest
  Walk your code through exception script to check it’s resiliency to failures.

pytest-executable
  last release: Oct 07, 2023, status: N/A, requires: pytest <8,>=5
  pytest plugin for testing executables

pytest-execution-timer
  last release: Dec 24, 2021, status: 4 - Beta, requires: N/A
  A timer for the phases of Pytest’s execution.
pytest-exit-code

*last release:* May 06, 2024, *status:* 4 - Beta, *requires:* pytest>=6.2.0

A pytest plugin that overrides the built-in exit codes to retain more information about the test results.

pytest-expect

*last release:* Apr 21, 2016, *status:* 4 - Beta, *requires:* N/A

pytest plugin to store test expectations and mark tests based on them

pytest-expectdir

*last release:* Mar 19, 2023, *status:* 5 - Production/Stable, *requires:* pytest (>=5.0)

A pytest plugin to provide initial/expected directories, and check a test transforms the initial directory to the expected one

pytest-expecter

*last release:* Sep 18, 2022, *status:* 5 - Production/Stable, *requires:* N/A

Better testing with expecter and pytest.

pytest-expectr

*last release:* Oct 05, 2018, *status:* N/A, *requires:* pytest (>=2.4.2)

This plugin is used to expect multiple assert using pytest framework.

pytest-expect-test

*last release:* Apr 10, 2023, *status:* 4 - Beta, *requires:* pytest (>=3.5.0)

A fixture to support expect tests in pytest

pytest-experiments

*last release:* Dec 13, 2021, *status:* 4 - Beta, *requires:* pytest (>=6.2.5,<7.0.0)

A pytest plugin to help developers of research-oriented software projects keep track of the results of their numerical experiments.

pytest-explicit

*last release:* Jun 15, 2021, *status:* 5 - Production/Stable, *requires:* pytest

A Pytest plugin to ignore certain marked tests by default

pytest-exploratory

*last release:* Aug 18, 2023, *status:* N/A, *requires:* pytest (>=6.2)

Interactive console for pytest.

pytest-explorer

*last release:* Aug 01, 2023, *status:* N/A, *requires:* N/A

terminal ui for exploring and running tests

pytest-ext

*last release:* Mar 31, 2024, *status:* N/A, *requires:* pytest>=5.3

pytest plugin for automation test

pytest-extensions

*last release:* Aug 17, 2022, *status:* 4 - Beta, *requires:* pytest ; extra == ‘testing’

A collection of helpers for pytest to ease testing

pytest-external-blockers

*last release:* Oct 05, 2021, *status:* N/A, *requires:* pytest

a special outcome for tests that are blocked for external reasons
pytest_extra
last release: Aug 14, 2014, status: N/A, requires: N/A
Some helpers for writing tests with pytest.

pytest-extra-durations
last release: Apr 21, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
A pytest plugin to get durations on a per-function basis and per module basis.

pytest-extra-markers
last release: Mar 05, 2023, status: 4 - Beta, requires: pytest
Additional pytest markers to dynamically enable/disable tests via CLI flags

pytest-fabric
last release: Sep 12, 2018, status: 5 - Production/Stable, requires: N/A
Provides test utilities to run fabric task tests by using docker containers

pytest-factor
last release: Feb 20, 2024, status: N/A, requires: N/A
A package to prevent Dependency Confusion attacks against Yandex.

pytest-factory
last release: Sep 06, 2020, status: 3 - Alpha, requires: pytest (>=4.3)
Use factories for test setup with py.test

pytest-factoryboy
last release: Mar 05, 2024, status: 6 - Mature, requires: pytest (>=6.2)
Factory Boy support for pytest.

pytest-factoryboy-fixtures
last release: Jun 25, 2020, status: N/A, requires: N/A
Generates pytest fixtures that allow the use of type hinting

pytest-factoryboy-state
last release: Mar 22, 2022, status: 5 - Production/Stable, requires: pytest (>=5.0)
Simple factoryboy random state management

pytest-failed-screen-record
last release: Jan 05, 2023, status: 4 - Beta, requires: pytest (>=7.1.2d,<8.0.0)
Create a video of the screen when pytest fails

pytest-failed-screenshot
last release: Apr 21, 2021, status: N/A, requires: N/A
Test case fails, take a screenshot, save it, attach it to the allure

pytest-failed-to-verify
last release: Aug 08, 2019, status: 5 - Production/Stable, requires: pytest (>=4.1.0)
A pytest plugin that helps better distinguishing real test failures from setup flakiness.

pytest-fail-slow
last release: Jun 01, 2024, status: N/A, requires: pytest>=7.0
Fail tests that take too long to run

3.2. Pytest Plugin List
pytest-faker
last release: Dec 19, 2016, status: 6 - Mature, requires: N/A
Faker integration with the pytest framework.

pytest-falcon
last release: Sep 07, 2016, status: 4 - Beta, requires: N/A
Pytest helpers for Falcon.

pytest-falcon-client
last release: Feb 21, 2024, status: N/A, requires: N/A
A package to prevent Dependency Confusion attacks against Yandex.

pytest-fantasy
last release: Mar 14, 2019, status: N/A, requires: N/A
Pytest plugin for Flask Fantasy Framework

pytest-fastapi
last release: Dec 27, 2020, status: N/A, requires: N/A

pytest-fastapi-deps
last release: Jul 20, 2022, status: 5 - Production/Stable, requires: pytest
A fixture which allows easy replacement of fastapi dependencies for testing

pytest-fastest
last release: Oct 04, 2023, status: 4 - Beta, requires: pytest (>=4.4)
Use SCM and coverage to run only needed tests

pytest-fast-first
last release: Jan 19, 2023, status: 3 - Alpha, requires: pytest
Pytest plugin that runs fast tests first

pytest-faulthandler
last release: Jul 04, 2019, status: 6 - Mature, requires: pytest (>=5.0)
py.test plugin that activates the fault handler module for tests (dummy package)

pytest-fauna
last release: May 30, 2024, status: N/A, requires: N/A
A collection of helpful test fixtures for Fauna DB.

pytest-fauxfactory
last release: Dec 06, 2017, status: 5 - Production/Stable, requires: pytest (>=3.2)
Integration of fauxfactory into pytest.

pytest-figleaf
last release: Jan 18, 2010, status: 5 - Production/Stable, requires: N/A
py.test figleaf coverage plugin

pytest-file
last release: Mar 18, 2024, status: 1 - Planning, requires: N/A
Pytest File

pytest-filecov
last release: Jun 27, 2021, status: 4 - Beta, requires: pytest
A pytest plugin to detect unused files
pytest-filedata
last release: Apr 29, 2024, status: 5 - Production/Stable, requires: N/A

easily load test data from files

pytest-filemarker
last release: Dec 01, 2020, status: N/A, requires: pytest

A pytest plugin that runs marked tests when files change.

pytest-file-watcher
last release: Mar 23, 2023, status: N/A, requires: pytest

Pytest-File-Watcher is a CLI tool that watches for changes in your code and runs pytest on the changed files.

pytest-filter-case
last release: Nov 05, 2020, status: N/A, requires: N/A

run test cases filter by mark

pytest-filter-subpackage
last release: Mar 04, 2024, status: 5 - Production/Stable, requires: pytest >=4.6

Pytest plugin for filtering based on sub-packages

pytest-find-dependencies
last release: Mar 16, 2024, status: 4 - Beta, requires: pytest >=4.3.0

A pytest plugin to find dependencies between tests

pytest-finer-verdicts
last release: Jun 18, 2020, status: N/A, requires: pytest (>=5.4.3)

A pytest plugin to treat non-assertion failures as test errors.

pytest-firefox
last release: Aug 08, 2017, status: 3 - Alpha, requires: pytest (>=3.0.2)

pytest plugin to manipulate firefox

pytest-fixture-classes
last release: Sep 02, 2023, status: 5 - Production/Stable, requires: pytest

Fixtures as classes that work well with dependency injection, autocompletion, type checkers, and language servers

pytest-fixturecollection
last release: Feb 22, 2024, status: 4 - Beta, requires: pytest >=3.5.0

A pytest plugin to collect tests based on fixtures being used by tests

pytest-fixture-config
last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest

Fixture configuration utils for py.test

pytest-fixture-maker
last release: Sep 21, 2021, status: N/A, requires: N/A

Pytest plugin to load fixtures from YAML files

pytest-fixture-marker
last release: Oct 11, 2020, status: 5 - Production/Stable, requires: N/A

A pytest plugin to add markers based on fixtures used.
pytest-fixture-order
   last release: May 16, 2022, status: 5 - Production/Stable, requires: pytest (>=3.0)
   pytest plugin to control fixture evaluation order

pytest-fixture-ref
   last release: Nov 17, 2022, status: 4 - Beta, requires: N/A
   Lets users reference fixtures without name matching magic.

pytest-fixture-remover
   last release: Feb 14, 2024, status: 5 - Production/Stable, requires: N/A
   A LibCST codemod to remove pytest fixtures applied via the usefixtures decorator, as well as its parametrizations.

pytest-fixture-rttg
   last release: Feb 23, 2022, status: N/A, requires: pytest (>=7.0.1,<8.0.0)
   Warn or fail on fixture name clash

pytest-fixtures
   last release: May 01, 2019, status: 5 - Production/Stable, requires: N/A
   Common fixtures for pytest

pytest-fixture-tools
   Plugin for pytest which provides tools for fixtures

pytest-fixture-typecheck
   last release: Aug 24, 2021, status: N/A, requires: pytest
   A pytest plugin to assert type annotations at runtime.

pytest-flake8
   last release: Mar 18, 2022, status: 4 - Beta, requires: pytest (>=7.0)
   pytest plugin to check FLAKE8 requirements

pytest-flake8-path
   last release: Jul 10, 2023, status: 5 - Production/Stable, requires: pytest
   A pytest fixture for testing flake8 plugins.

pytest-flake8-v2
   last release: Mar 01, 2022, status: 5 - Production/Stable, requires: pytest (>=7.0)
   pytest plugin to check FLAKE8 requirements

pytest-flakefinder
   last release: Oct 26, 2022, status: 4 - Beta, requires: pytest (>=2.7.1)
   Runs tests multiple times to expose flakiness.

pytest-flakes
   last release: Dec 02, 2021, status: 5 - Production/Stable, requires: pytest (>=5)
   pytest plugin to check source code with pyflakes

pytest-flaptastic
   last release: Mar 17, 2019, status: N/A, requires: N/A
   Flaptastic py.test plugin
pytest-flask
*last release:* Oct 23, 2023, *status:* 5 - Production/Stable, *requires:* pytest >=5.2
A set of py.test fixtures to test Flask applications.

pytest-flask-ligand
*last release:* Apr 25, 2023, *status:* 4 - Beta, *requires:* pytest (~=7.3)
Pytest fixtures and helper functions to use for testing flask-ligand microservices.

pytest-flask-sqlalchemy
*last release:* Apr 30, 2022, *status:* 4 - Beta, *requires:* pytest (>=3.2.1)
A pytest plugin for preserving test isolation in Flask-SQLAlchemy using database transactions.

pytest-flask-sqlalchemy-transactions
*last release:* Aug 02, 2018, *status:* 4 - Beta, *requires:* pytest (>=3.2.1)
Run tests in transactions using pytest, Flask, and SQLAlchemy.

pytest-flexreport
*last release:* Apr 15, 2023, *status:* 4 - Beta, *requires:* pytest

pytest-fluent
*last release:* Jun 05, 2024, *status:* 4 - Beta, *requires:* pytest>=7.0.0
A pytest plugin in order to provide logs via fluentd

pytest-fluentbit
*last release:* Jun 16, 2023, *status:* 4 - Beta, *requires:* pytest (>=7.0.0)
A pytest plugin in order to provide logs via fluentbit

pytest-fly
*last release:* Apr 14, 2024, *status:* 3 - Alpha, *requires:* pytest
pytest observer

pytest-flyte
*last release:* May 03, 2021, *status:* N/A, *requires:* pytest
Pytest fixtures for simplifying Flyte integration testing

pytest-focus
*last release:* May 04, 2019, *status:* 4 - Beta, *requires:* pytest
A pytest plugin that alerts user of failed test cases with screen notifications

pytest-forbid
*last release:* Mar 07, 2023, *status:* N/A, *requires:* pytest (>=7.2.2,<8.0.0)

pytest-forcefail
*last release:* May 15, 2018, *status:* 4 - Beta, *requires:* N/A
py.test plugin to make the test failing regardless of pytest.mark.xfail

pytest-forks
*last release:* Mar 05, 2024, *status:* N/A, *requires:* N/A
Fork helper for pytest

pytest-forward-compatibility
*last release:* Sep 06, 2020, *status:* N/A, *requires:* N/A
A name to avoid typosquating pytest-forward-compatibility
pytest-forward-compatibility
  last release: Sep 29, 2020, status: N/A, requires: N/A
  A pytest plugin to shim pytest commandline options for forwards compatibility

pytest-frappe
  last release: Oct 29, 2023, status: 4 - Beta, requires: pytest>=7.0.0
  Pytest Frappe Plugin - A set of pytest fixtures to test Frappe applications

pytest-freezegun
  last release: Jul 19, 2020, status: 4 - Beta, requires: pytest (>=3.0.0)
  Wrap tests with fixtures in freeze_time

pytest-freezer
  last release: Jun 21, 2023, status: N/A, requires: pytest >= 3.6
  Pytest plugin providing a fixture interface for spulec/freezegun

pytest-freeze-reqs
  last release: Apr 29, 2021, status: N/A, requires: N/A
  Check if requirement files are frozen

pytest-frozen-uuids
  last release: Apr 17, 2022, status: N/A, requires: pytest (>=3.0)
  Deterministically frozen UUID's for your tests

pytest-func-cov
  last release: Apr 15, 2021, status: 3 - Alpha, requires: pytest (>=5)
  Pytest plugin for measuring function coverage

pytest-funparam
  last release: Dec 02, 2021, status: 4 - Beta, requires: pytest >=4.6.0
  An alternative way to parametrize test cases.

pytest-fxa
  last release: Aug 28, 2018, status: 5 - Production/Stable, requires: N/A
  pytest plugin for Firefox Accounts

pytest-fxtest
  last release: Oct 27, 2020, status: N/A, requires: N/A

pytest-fzf
  last release: Feb 07, 2024, status: 4 - Beta, requires: pytest >=6.0.0
  fzf-based test selector for pytest

pytest_gae
  last release: Aug 03, 2016, status: 3 - Alpha, requires: N/A
  pytest plugin for apps written with Google's AppEngine

pytest-gather-fixtures
  last release: Apr 12, 2022, status: N/A, requires: pytest (>=6.0.0)
  set up asynchronous pytest fixtures concurrently

pytest-ge
  last release: Feb 01, 2018, status: N/A, requires: N/A
  The garbage collector plugin for pytest
pytest-gcov

last release: Feb 01, 2018, status: 3 - Alpha, requires: N/A

Uses gcov to measure test coverage of a C library

pytest-gcs

last release: Mar 01, 2024, status: 5 - Production/Stable, requires: pytest >= 6.2

GCS fixtures and fixture factories for Pytest.

pytest-gee

last release: Feb 15, 2024, status: 3 - Alpha, requires: pytest

The Python plugin for your GEE based packages.

pytest-gevent

last release: Feb 25, 2020, status: N/A, requires: pytest

Ensure that gevent is properly patched when invoking pytest

pytest-gherkin

last release: Jul 27, 2019, status: 3 - Alpha, requires: pytest (>= 5.0.0)

A flexible framework for executing BDD gherkin tests

pytest-gh-log-group

last release: Jan 11, 2022, status: 3 - Alpha, requires: pytest

pytest plugin for gh actions

pytest-ghostinspector

last release: May 17, 2016, status: 3 - Alpha, requires: N/A

For finding/executing Ghost Inspector tests

pytest-girder

last release: Apr 12, 2024, status: N/A, requires: pytest>=3.6

A set of pytest fixtures for testing Girder applications.

pytest-git

last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest

Git repository fixture for py.test

pytest-gitconfig

last release: Oct 15, 2023, status: 4 - Beta, requires: pytest>=7.1.2

Provide a gitconfig sandbox for testing

pytest-gitcov

last release: Jan 11, 2020, status: 2 - Pre-Alpha, requires: N/A

Pytest plugin for reporting on coverage of the last git commit.

pytest-git-diff

last release: Apr 02, 2024, status: N/A, requires: N/A

Pytest plugin that allows the user to select the tests affected by a range of git commits

pytest-git-fixtures

last release: Mar 11, 2021, status: 4 - Beta, requires: pytest

Pytest fixtures for testing with git.
pytest-github
last release: Mar 07, 2019, status: 5 - Production/Stable, requires: N/A
Plugin for py.test that associates tests with github issues using a marker.

pytest-github-actions-annotate-failures
last release: May 04, 2023, status: 5 - Production/Stable, requires: pytest (>=4.0.0)
pytest plugin to annotate failed tests with a workflow command for GitHub Actions

pytest-github-report
last release: Jun 03, 2022, status: 4 - Beta, requires: N/A
Generate a GitHub report using pytest in GitHub Workflows

pytest-gitignore
last release: Jul 17, 2015, status: 4 - Beta, requires: N/A
py.test plugin to ignore the same files as git

pytest-gitlabci-parallelized
last release: Mar 08, 2023, status: N/A, requires: N/A
Parallelize pytest across GitLab CI workers.

pytest-gitlab-code-quality
last release: Apr 03, 2024, status: N/A, requires: pytest>=8.1.1
Collects warnings while testing and generates a GitLab Code Quality Report.

pytest-gitlab-fold
last release: Dec 31, 2023, status: 4 - Beta, requires: pytest >=2.6.0
Folds output sections in GitLab CI build log

pytest-git-selector
last release: Nov 17, 2022, status: N/A, requires: N/A
Utility to select tests that have had its dependencies modified (as identified by git diff)

pytest-glamor-allure
last release: Apr 30, 2024, status: 4 - Beta, requires: pytest<=8.2.0
Extends allure-pytest functionality

pytest-gnupg-fixtures
last release: Mar 04, 2021, status: 4 - Beta, requires: pytest
Pytest fixtures for testing with gnupg.

pytest-golden
last release: Jul 18, 2022, status: N/A, requires: pytest (>=6.1.2)
Plugin for pytest that offloads expected outputs to data files

pytest-goldie
last release: May 23, 2023, status: 4 - Beta, requires: pytest (>=3.5.0)
A plugin to support golden tests with pytest.

pytest-google-chat
last release: Mar 27, 2022, status: 4 - Beta, requires: pytest
Notify google chat channel for test results
pytest-graphql-schema
  last release: Oct 18, 2019, status: N/A, requires: N/A
  Get graphql schema as fixture for pytest

pytest-greendots
  last release: Feb 08, 2014, status: 3 - Alpha, requires: N/A
  Green progress dots

pytest-group-by-class
  last release: Jun 27, 2023, status: 5 - Production/Stable, requires: pytest (>=2.5)
  A Pytest plugin for running a subset of your tests by splitting them in to groups of classes.

pytest-growl
  last release: Jan 13, 2014, status: 5 - Production/Stable, requires: N/A
  Growl notifications for pytest results.

pytest-grpc
  last release: May 01, 2020, status: N/A, requires: pytest (>=3.6.0)
  pytest plugin for grpc

pytest-grunnur
  last release: Feb 05, 2023, status: N/A, requires: N/A
  Py.Test plugin for Grunnur-based packages.

pytest_gui_status
  last release: Jan 23, 2016, status: N/A, requires: pytest
  Show pytest status in gui

pytest-hammertime
  last release: Jul 28, 2018, status: N/A, requires: pytest
  Display “\ “ instead of “.” for passed pytest tests.

pytest-hardware-test-report
  last release: Apr 01, 2024, status: 4 - Beta, requires: pytest<9.0.0,>=8.0.0
  A simple plugin to use with pytest

pytest-harmony
  last release: Jan 17, 2023, status: N/A, requires: pytest (>=7.2.1,<8.0.0)
  Chain tests and data with pytest

pytest-harvest
  last release: Mar 16, 2024, status: 5 - Production/Stable, requires: N/A
  Store data created during your pytest tests execution, and retrieve it at the end of the session, e.g. for applicative benchmarking purposes.

pytest-helm-charts
  last release: Feb 07, 2024, status: 4 - Beta, requires: pytest (>=8.0.0,<9.0.0)
  A plugin to provide different types and configs of Kubernetes clusters that can be used for testing.

pytest-helm-templates
  last release: May 08, 2024, status: N/A, requires: pytest~=7.4.0; extra == “dev”
  Pytest fixtures for unit testing the output of helm templates
pytest Documentation, Release 8.3

pytest-helper
  last release: May 31, 2019, status: 5 - Production/Stable, requires: N/A
  Functions to help in using the pytest testing framework

pytest-helpers
  last release: May 17, 2020, status: N/A, requires: pytest
  pytest helpers

pytest-helpers-namespace
  last release: Dec 29, 2021, status: 5 - Production/Stable, requires: pytest (>=6.0.0)
  Pytest Helpers Namespace Plugin

pytest-henry
  last release: Aug 29, 2023, status: N/A, requires: N/A

pytest-hidecaptured
  last release: May 04, 2018, status: 4 - Beta, requires: pytest (>=2.8.5)
  Hide captured output

pytest-himark
  last release: Jun 05, 2024, status: 4 - Beta, requires: pytest>=6.2.0
  This plugin aims to create markers automatically based on a json configuration.

pytest-historic
  last release: Apr 08, 2020, status: N/A, requires: pytest
  Custom report to display pytest historical execution records

pytest-historic-hook
  last release: Apr 08, 2020, status: N/A, requires: pytest
  Custom listener to store execution results into MYSQL DB, which is used for pytest-historic report

pytest-history
  last release: Jan 14, 2024, status: N/A, requires: pytest (>=7.4.3,<8.0.0)
  Pytest plugin to keep a history of your pytest runs

pytest-home
  last release: Oct 09, 2023, status: 5 - Production/Stable, requires: pytest
  Home directory fixtures

pytest-homeassistant
  last release: Aug 12, 2020, status: 4 - Beta, requires: N/A
  A pytest plugin for use with homeassistant custom components.

pytest-homeassistant-custom-component
  last release: Jun 29, 2024, status: 3 - Alpha, requires: pytest==8.2.0
  Experimental package to automatically extract test plugins for Home Assistant custom components

pytest-honey
  last release: Jan 07, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
  A simple plugin to use with pytest

pytest-honors
  last release: Mar 06, 2020, status: 4 - Beta, requires: N/A
  Report on tests that honor constraints, and guard against regressions

</table>
**pytest Documentation, Release 8.3**

**pytest-html-thread**
- last release: Dec 29, 2020, status: 5 - Production/Stable, requires: N/A
- Pytest plugin for generating HTML reports

**pytest-http**
- last release: Dec 05, 2019, status: N/A, requires: N/A
- Fixture “http” for http requests

**pytest-httpbin**
- last release: May 08, 2023, status: 5 - Production/Stable, requires: pytest; extra == ‘test’
- Easily test your HTTP library against a local copy of httpbin

**pytest-httpdbg**
- last release: Jan 10, 2024, status: 3 - Alpha, requires: pytest >= 7.0.0
- A pytest plugin to record HTTP(S) requests with stack trace

**pytest-http-mocker**
- last release: Oct 20, 2019, status: N/A, requires: N/A
- Pytest plugin for http mocking (via https://github.com/vilus/mocker)

**pytest-httpretty**
- last release: Feb 16, 2014, status: 3 - Alpha, requires: N/A
- A thin wrapper of HTTPretty for pytest

**pytest_httpserver**
- last release: Feb 24, 2024, status: 3 - Alpha, requires: N/A
- pytest-httpserver is a httpserver for pytest

**pytest-httptesting**
- last release: May 08, 2024, status: N/A, requires: pytest<9.0.0,>=8.2.0
- http_testing framework on top of pytest

**pytest-httpx**
- last release: Feb 21, 2024, status: 5 - Production/Stable, requires: pytest < 9, >= 7
- Send responses to httpx.

**pytest-httpx-blockage**
- last release: Feb 16, 2023, status: N/A, requires: pytest (>= 7.2.1)
- Disable httpx requests during a test run

**pytest-httpx-recorder**
- last release: Jan 04, 2024, status: 5 - Production/Stable, requires: pytest
- Recorder feature based on pytest_httpx, like recorder feature in responses.

**pytest-hue**
- last release: May 09, 2019, status: N/A, requires: N/A
- Visualise PyTest status via your Phillips Hue lights

**pytest-hylang**
- last release: Mar 28, 2021, status: N/A, requires: pytest
- Pytest plugin to allow running tests written in hylang
pytest-hypo-25
  *last release: Jan 12, 2020, status: 3 - Alpha, requires: N/A*
  
  help hypo module for pytest

pytest-iam
  *last release: Apr 22, 2024, status: 3 - Alpha, requires: pytest>=7.0.0*
  
  A fully functional OAUTH2 / OpenID Connect (OIDC) server to be used in your test suite

pytest-ibutsu
  *last release: Aug 05, 2022, status: 4 - Beta, requires: pytest>=7.1*
  
  A plugin to send pytest results to an Ibutsu server

pytest-icdiff
  *last release: Dec 05, 2023, status: 4 - Beta, requires: pytest*
  
  use icdiff for better error messages in pytest assertions

pytest-idapro
  *last release: Nov 03, 2018, status: N/A, requires: N/A*
  
  A pytest plugin for idapython. Allows a pytest setup to run tests outside and inside IDA in an automated manner by running pytest inside IDA and by mocking idapython api

pytest-ideem
  *last release: Dec 13, 2023, status: 5 - Production/ Stable, requires: N/A*
  
  A pytest plugin to help with testing ideem projects

pytest-idempotent
  *last release: Jul 25, 2022, status: N/A, requires: N/A*
  
  Pytest plugin for testing function idempotence.

pytest-ignore-flaky
  *last release: Apr 20, 2024, status: 5 - Production/ Stable, requires: pytest>=6.0*
  
  ignore failures from flaky tests (pytest plugin)

pytest-ignore-test-results
  *last release: Aug 17, 2023, status: 2 - Pre-Alpha, requires: pytest>=7.0*
  
  A pytest plugin to ignore test results.

pytest-image-diff
  *last release: Mar 09, 2023, status: 3 - Alpha, requires: pytest*

pytest-image-snapshot
  *last release: Dec 01, 2023, status: 4 - Beta, requires: pytest >3.5.0*
  
  A pytest plugin for image snapshot management and comparison.

pytest-incremental
  *last release: Apr 24, 2021, status: 5 - Production/ Stable, requires: N/A*
  
  an incremental test runner (pytest plugin)

pytest-infinity
  *last release: Jun 09, 2024, status: N/A, requires: pytest<9.0.0, >=8.0.0*

pytest-influxdb
  *last release: Apr 20, 2021, status: N/A, requires: N/A*
  
  Plugin for influxdb and pytest integration.

3.2. Pytest Plugin List
pytest Documentation, Release 8.3

pytest-info-collector
last release: May 26, 2019, status: 3 - Alpha, requires: N/A
pytest plugin to collect information from tests

pytest-info-plugin
last release: Sep 14, 2023, status: N/A, requires: N/A
Get executed interface information in pytest interface automation framework

pytest-informative-node
last release: Apr 25, 2019, status: 4 - Beta, requires: N/A
display more node in ininformation.

pytest-infrastructure
last release: Apr 12, 2020, status: 4 - Beta, requires: N/A
pytest stack validation prior to testing executing

pytest-ini
last release: Apr 26, 2022, status: N/A, requires: N/A
Reuse pytest.ini to store env variables

pytest-initr
last release: Apr 30, 2024, status: N/A, requires: pytest<9.0.0,>=8.1.1
Plugin for sending automation test data from Pytest to the initry

pytest-inline
last release: Oct 19, 2023, status: 4 - Beta, requires: pytest >=7.0.0
A pytest plugin for writing inline tests.

pytest-inmanta
last release: Dec 13, 2023, status: 5 - Production/Stable, requires: pytest
A py.test plugin providing fixtures to simplify inmanta modules testing.

pytest-inmanta-extensions
last release: May 24, 2024, status: 5 - Production/Stable, requires: N/A
Inmanta tests package

pytest-inmanta-lsm
last release: May 10, 2024, status: 5 - Production/Stable, requires: N/A
Common fixtures for inmanta LSM related modules

pytest-inmanta-yang
last release: Feb 22, 2024, status: 4 - Beta, requires: pytest
Common fixtures used in inmanta yang related modules

pytest-Inomaly
last release: Feb 13, 2018, status: 4 - Beta, requires: N/A
A simple image diff plugin for pytest

pytest-in-robotframework
last release: Mar 02, 2024, status: N/A, requires: pytest
The extension enables easy execution of pytest tests within the Robot Framework environment.
pytest-inper

last release: Mar 21, 2024, status: N/A, requires: pytest

Pytest plugin for courses at Insper

pytest-instap

last release: Feb 19, 2024, status: N/A, requires: pytest (>=7.2.0,<9.0.0)

A practical snapshot testing plugin for pytest

pytest-instafail

last release: Mar 31, 2023, status: 4 - Beta, requires: pytest (>=5)

pytest plugin to show failures instantly

pytest-instrument

last release: Apr 05, 2020, status: 5 - Production/Stable, requires: pytest (>=5.1.0)

pytest plugin to instrument tests

pytest-integration

last release: Nov 17, 2022, status: N/A, requires: N/A

Organizing pytests by integration or not

pytest-integration-mark

last release: May 22, 2023, status: N/A, requires: pytest (>=5.2)

Automatic integration test marking and excluding plugin for pytest

pytest-interactive

last release: Nov 30, 2017, status: 3 - Alpha, requires: N/A

A pytest plugin for console based interactive test selection just after the collection phase

pytest-intercept-remote

last release: May 24, 2021, status: 4 - Beta, requires: pytest (>=4.6)

Pytest plugin for intercepting outgoing connection requests during pytest run.

pytest-interface-tester

last release: Feb 09, 2024, status: 4 - Beta, requires: pytest

Pytest plugin for checking charm relation interface protocol compliance.

pytest-invenio

last release: Jun 27, 2024, status: 5 - Production/Stable, requires: pytest<7.2.0,>=6

Pytest fixtures for Invenio.

pytest-involve

last release: Feb 02, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)

Run tests covering a specific file or changeset

pytest-ipdb

last release: Mar 20, 2013, status: 2 - Pre-Alpha, requires: N/A

A py.test plug-in to enable drop to ipdb debugger on test failure.

pytest-ipynb

last release: Jan 29, 2019, status: 3 - Alpha, requires: N/A

THIS PROJECT IS ABANDONED

pytest-ipywidgets

last release: Jun 06, 2024, status: N/A, requires: pytest
pytest-isolate
  last release: Feb 20, 2023, status: 4 - Beta, requires: pytest

pytest-isort
  last release: Mar 05, 2024, status: 5 - Production/Stable, requires: pytest (>=5.0)
  py.test plugin to check import ordering using isort

pytest-it
  last release: Jan 29, 2024, status: 4 - Beta, requires: N/A
  Pytest plugin to display test reports as a plaintext spec, inspired by Rspec: https://github.com/mattduck/pytest-it.

pytest-iterassert
  last release: May 11, 2020, status: 3 - Alpha, requires: N/A
  Nicer list and iterable assertion messages for pytest

pytest-iters
  last release: May 24, 2022, status: N/A, requires: N/A
  A contextmanager pytest fixture for handling multiple mock iters

pytest_jar_yuan
  last release: Dec 12, 2022, status: N/A, requires: N/A
  A allure and pytest used package

pytest-jasmine
  last release: Nov 04, 2017, status: 1 - Planning, requires: N/A
  Run jasmine tests from your pytest test suite

pytest-jelastic
  last release: Nov 16, 2022, status: N/A, requires: pytest (>=7.2.0,<8.0.0)
  Pytest plugin defining the necessary command-line options to pass to pytests testing a Jelastic environment.

pytest-jest
  last release: May 22, 2018, status: 4 - Beta, requires: pytest (>=3.3.2)
  A custom jest-pytest oriented Pytest reporter

pytest-jinna
  last release: Oct 04, 2022, status: 3 - Alpha, requires: pytest (>=6.2.5,<7.0.0)
  A plugin to generate customizable jinja-based HTML reports in pytest

pytest-jira
  last release: Apr 30, 2024, status: 3 - Alpha, requires: N/A
  py.test JIRA integration plugin, using markers

pytest-jira-xfail
  last release: Jun 06, 2024, status: N/A, requires: pytest>=7.2.0
  Plugin skips (xfail) tests if unresolved Jira issue(s) linked

pytest-jira-xray
  last release: Mar 27, 2024, status: 4 - Beta, requires: pytest>=6.2.4
  pytest plugin to integrate tests with JIRA XRAY

pytest-job-selection
  last release: Jan 30, 2023, status: 4 - Beta, requires: pytest (>=3.5.0)
  A pytest plugin for load balancing test suites
pytest-jobserver
  last release: May 15, 2019, status: 5 - Production/Stable, requires: pytest
  Limit parallel tests with posix jobserver.

pytest-joke
  last release: Oct 08, 2019, status: 4 - Beta, requires: pytest (>=4.2.1)
  Test failures are better served with humor.

pytest-json
  last release: Jan 18, 2016, status: 4 - Beta, requires: N/A
  Generate JSON test reports

pytest-json-ctrf
  last release: Jun 15, 2024, status: N/A, requires: pytest>6.0.0
  Pytest plugin to generate json report in CTRF (Common Test Report Format)

pytest-json-fixtures
  last release: Mar 14, 2023, status: 4 - Beta, requires: N/A
  JSON output for the --fixtures flag

pytest-jsonlint
  last release: Aug 04, 2016, status: N/A, requires: N/A
  UNKNOWN

pytest-json-report
  last release: Mar 15, 2022, status: 4 - Beta, requires: pytest (>=3.8.0)
  A pytest plugin to report test results as JSON files

pytest-json-report-wip
  last release: Oct 28, 2023, status: 4 - Beta, requires: pytest >=3.8.0
  A pytest plugin to report test results as JSON files

pytest-jsonschema
  last release: Mar 27, 2024, status: 4 - Beta, requires: pytest>=6.2.0
  A pytest plugin to perform JSONSchema validations

pytest-jtr
  last release: Jun 04, 2024, status: N/A, requires: pytest<8.0.0,>=7.1.2
  pytest plugin supporting json test report output

pytest-jupyter
  last release: Apr 04, 2024, status: 4 - Beta, requires: pytest>=7.0
  A pytest plugin for testing Jupyter libraries and extensions.

pytest-jupyterhub
  last release: Apr 25, 2023, status: 5 - Production/Stable, requires: pytest
  A reusable JupyterHub pytest plugin

pytest-kafka
  last release: Jun 14, 2023, status: N/A, requires: pytest
  Zookeeper, Kafka server, and Kafka consumer fixtures for Pytest

3.2. Pytest Plugin List
pytest-kafkavents
  last release: Sep 08, 2021, status: 4 - Beta, requires: pytest
  A plugin to send pytest events to Kafka

pytest-kasima
  last release: Jan 26, 2023, status: 5 - Production/Stable, requires: pytest (>=7.2.1,<8.0.0)
  Display horizontal lines above and below the captured standard output for easy viewing.

pytest-keep-together
  last release: Dec 07, 2022, status: 5 - Production/Stable, requires: pytest
  Pytest plugin to customize test ordering by running all ‘related’ tests together

pytest-kexi
  last release: Apr 29, 2022, status: N/A, requires: pytest (>=7.1.2,<8.0.0)

pytest-keyring
  last release: Oct 01, 2023, status: N/A, requires: pytest (>=7.1)
  A Pytest plugin to access the system’s keyring to provide credentials for tests

pytest-kind
  last release: Nov 30, 2022, status: 5 - Production/Stable, requires: N/A
  Kubernetes test support with KIND for pytest

pytest-kivy
  last release: Jul 06, 2021, status: 4 - Beta, requires: pytest (>=3.6)
  Kivy GUI tests fixtures using pytest

pytest-knows
  last release: Aug 22, 2014, status: N/A, requires: N/A
  A pytest plugin that can automatically skip test case based on dependence info calculated by trace

pytest-konira
  last release: Oct 09, 2011, status: N/A, requires: N/A
  Run Konira DSL tests with py.test

pytest-kookit
  last release: May 16, 2024, status: N/A, requires: N/A
  Your simple but kooky integration testing with pytest

pytest-koopmans
  last release: Nov 21, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
  A plugin for testing the koopmans package

pytest-krtech-common
  last release: Nov 28, 2016, status: 4 - Beta, requires: N/A
  pytest krtech common library

pytest-kubernetes
  last release: Sep 14, 2023, status: N/A, requires: pytest (>=7.2.1,<8.0.0)

pytest-kuunda
  last release: Feb 25, 2024, status: 4 - Beta, requires: pytest >=6.2.0
  pytest plugin to help with test data setup for PySpark tests
pytest-kwparametrizer
  Alternate syntax for @pytest.mark.parametrized with test cases as dictionaries and default value fallbacks

pytest-lambda
  *last release*: May 27, 2024, *status*: 5 - Production/Stable, *requires*: pytest<9,>=3.6
  Define pytest fixtures with lambda functions.

pytest-lamp
  *last release*: Jan 06, 2017, *status*: 3 - Alpha, *requires*: N/A

pytest-langchain
  *last release*: Feb 26, 2023, *status*: N/A, *requires*: pytest
  Pytest-style test runner for langchain agents

pytest-lark
  *last release*: Nov 05, 2023, *status*: N/A, *requires*: N/A
  Create fancy and clear HTML test reports.

pytest-launchable
  *last release*: Apr 05, 2023, *status*: N/A, *requires*: pytest (>=4.2.0)
  Launchable Pytest Plugin

pytest-layab
  *last release*: Oct 05, 2020, *status*: 5 - Production/Stable, *requires*: N/A
  Pytest fixtures for layab.

pytest-lazy-fixture
  *last release*: Feb 01, 2020, *status*: 4 - Beta, *requires*: pytest (>=3.2.5)
  It helps to use fixtures in pytest.mark.parametrize

pytest-lazy-fixtures
  Allows you to use fixtures in @pytest.mark.parametrize.

pytest-ldap
  python-ldap fixtures for pytest

pytest-leak-finder
  *last release*: Feb 15, 2023, *status*: 4 - Beta, *requires*: pytest (>=3.5.0)
  Find the test that's leaking before the one that fails

pytest-leaks
  *last release*: Nov 27, 2019, *status*: 1 - Planning, *requires*: N/A
  A pytest plugin to trace resource leaks.

pytest-leaping
  *last release*: Mar 27, 2024, *status*: 4 - Beta, *requires*: pytest>=6.2.0
  A simple plugin to use with pytest

pytest-level
  Select tests of a given level or lower

</table>
pytest-localserver

- last release: Oct 12, 2023, status: 4 - Beta, requires: N/A
- Pytest plugin to test server connections locally.

pytest-localstack

- last release: Jun 07, 2023, status: 4 - Beta, requires: pytest (>=6.0.0,<7.0.0)
- Pytest plugin for AWS integration tests

pytest-lock

- last release: Feb 03, 2024, status: N/A, requires: pytest (>=7.4.3,<8.0.0)
- pytest-lock is a pytest plugin that allows you to “lock” the results of unit tests, storing them in a local cache. This is particularly useful for tests that are resource-intensive or don't need to be run every time. When the tests are run subsequently, pytest-lock will compare the current results with the locked results and issue a warning if there are any discrepancies.

pytest-lockable

- last release: Jan 24, 2024, status: 5 - Production/Stable, requires: pytest
- lockable resource plugin for pytest

pytest-locker

- last release: Oct 29, 2021, status: N/A, requires: pytest (>=5.4)
- Used to lock object during testing. Essentially changing assertions from being hard coded to asserting that nothing changed

pytest-log

- last release: Aug 15, 2021, status: N/A, requires: pytest (>=3.8)
- print log

pytest-logbook

- last release: Nov 23, 2015, status: 5 - Production/Stable, requires: pytest (>=2.8)
- Py.test plugin to capture logbook log messages

pytest-logdog

- last release: Jun 15, 2021, status: 1 - Planning, requires: pytest (>=6.2.0)
- Pytest plugin to test logging

pytest-logfest

- last release: Jul 21, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
- Pytest plugin providing three logger fixtures with basic or full writing to log files

pytest-logger

- last release: Mar 10, 2024, status: 5 - Production/Stable, requires: pytest (>=3.2)
- Plugin configuring handlers for loggers from Python logging module.

pytest-logging

- last release: Nov 04, 2015, status: 4 - Beta, requires: N/A
- Configures logging and allows tweaking the log level with a py.test flag

pytest-logging-end-to-end-test-tool

- last release: Sep 23, 2022, status: N/A, requires: pytest (>=7.1.2,<8.0.0)

pytest-logikal

- last release: Jun 27, 2024, status: 5 - Production/Stable, requires: pytest==8.2.2
- Common testing environment
pytest-log-report

last release: Dec 26, 2019, status: N/A, requires: N/A

Package for creating a pytest test run report

pytest-loguru

last release: Mar 20, 2024, status: 5 - Production/Stable, requires: pytest; extra == “test”

Pytest Loguru

pytest-loop

last release: Mar 30, 2024, status: 5 - Production/Stable, requires: pytest

pytest plugin for looping tests

pytest-lsp

last release: May 22, 2024, status: 3 - Alpha, requires: pytest

A pytest plugin for end-to-end testing of language servers

pytest-manual-marker

last release: Aug 04, 2022, status: 3 - Alpha, requires: pytest>=7

pytest marker for marking manual tests

pytest-markdoctest

last release: Jul 22, 2022, status: 4 - Beta, requires: pytest (>=6)

A pytest plugin to doctest your markdown files

pytest-markdown

last release: Jan 15, 2021, status: 4 - Beta, requires: pytest (>=6.0.1,<7.0.0)

Test your markdown docs with pytest

pytest-markdown-docs

last release: Mar 05, 2024, status: N/A, requires: pytest (>=7.0.0)

Run markdown code fences through pytest

pytest-marker-bugzilla

last release: Jan 09, 2020, status: N/A, requires: N/A

pytest plugin and bowler codemod to help migrate tests to Python 3

py.test bugzilla integration plugin, using markers

pytest-markers-presence

last release: Feb 04, 2021, status: 4 - Beta, requires: pytest (>=6.0)

A simple plugin to detect missed pytest tags and markers

pytest-markfiltration

last release: Nov 08, 2011, status: 3 - Alpha, requires: N/A

UNKNOWN

pytest-mark-manage

last release: Jun 07, 2024, status: N/A, requires: pytest

pytest plugin and bowler codemod to help migrate tests to Python 3

pytest-mark-no-py3

last release: May 17, 2019, status: N/A, requires: pytest

pytest plugin and bowler codemod to help migrate tests to Python 3
pytest-marks
last release: Nov 23, 2012, status: 3 - Alpha, requires: N/A
UNKNOWN
pytest-matcher
last release: Mar 15, 2024, status: 5 - Production/Stable, requires: pytest
Easy way to match captured ‘pytest’ output against expectations stored in files
pytest-match-skip
last release: May 15, 2019, status: 4 - Beta, requires: pytest (>=4.4.1)
Skip matching marks. Matches partial marks using wildcards.
pytest-mat-report
last release: Jan 20, 2021, status: N/A, requires: N/A
this is report
pytest-matrix
last release: Jun 24, 2020, status: 5 - Production/Stable, requires: pytest (>=5.4.3,<6.0.0)
Provide tools for generating tests from combinations of fixtures.
pytest-maxcov
last release: Sep 24, 2023, status: N/A, requires: pytest (>=7.4.0,<8.0.0)
Compute the maximum coverage available through pytest with the minimum execution time cost
pytest-maybe-context
last release: Apr 16, 2023, status: N/A, requires: pytest (>=7,<8)
Simplify tests with warning and exception cases.
pytest-maybe-raises
last release: May 27, 2022, status: N/A, requires: pytest ; extra == 'dev'
Pytest fixture for optional exception testing.
pytest-mccabe
last release: Jul 22, 2020, status: 3 - Alpha, requires: pytest (>=5.4.0)
pytest plugin to run the mccabe code complexity checker.
pytest-md
last release: Jul 11, 2019, status: 3 - Alpha, requires: pytest (>=4.2.1)
Plugin for generating Markdown reports for pytest results
pytest-md-report
last release: May 18, 2024, status: 4 - Beta, requires: pytest!=6.0.0,<9,>=3.3.2
A pytest plugin to generate test outcomes reports with markdown table format.
pytest-meilisearch
last release: Feb 15, 2024, status: N/A, requires: pytest (>=7.4.3)
Pytest helpers for testing projects using Meilisearch
pytest-memlog
last release: May 03, 2023, status: N/A, requires: pytest (>=7.3.0,<8.0.0)
Log memory usage during tests

3.2. Pytest Plugin List
pytest-memprof
  last release: Mar 29, 2019, status: 4 - Beta, requires: N/A
  Estimates memory consumption of test functions

pytest-memray
  last release: Apr 18, 2024, status: N/A, requires: pytest>=7.2
  A simple plugin to use with pytest

pytest-menu
  last release: Oct 04, 2017, status: 3 - Alpha, requires: pytest (>=2.4.2)
  A pytest plugin for console based interactive test selection just after the collection phase

pytest-mercurial
  last release: Nov 21, 2020, status: 1 - Planning, requires: N/A
  pytest plugin to write integration tests for projects using Mercurial Python internals

pytest-mesh
  last release: Aug 05, 2022, status: N/A, requires: pytest (=7.1.2)
  pytest_mesh插件

pytest-message
  last release: Aug 04, 2022, status: N/A, requires: pytest (>=6.2.5)
  Pytest plugin for sending report message of marked tests execution

pytest-messenger
  last release: Nov 24, 2022, status: 5 - Production/Stable, requires: N/A
  Pytest to Slack reporting plugin

pytest-metadata
  last release: Feb 12, 2024, status: 5 - Production/Stable, requires: pytest>=7.0.0
  pytest plugin for test session metadata

pytest-metrics
  last release: Apr 04, 2020, status: N/A, requires: pytest
  Custom metrics report for pytest

pytest-mh
  last release: Jun 13, 2024, status: N/A, requires: pytest
  Pytest multihost plugin

pytest-mimesis
  last release: Mar 21, 2020, status: 5 - Production/Stable, requires: pytest (>=4.2)
  Mimesis integration with the pytest test runner

pytest-minecraft
  last release: Apr 06, 2022, status: N/A, requires: pytest (>=6.0.1)
  A pytest plugin for running tests against Minecraft releases

pytest-mini
  last release: Feb 06, 2023, status: N/A, requires: pytest (>=7.2.0,<8.0.0)
  A plugin to test mp
pytest-minio-mock

last release: May 26, 2024, status: N/A, requires: pytest>=5.0.0

A pytest plugin for mocking Minio S3 interactions

pytest-missing-fixtures

last release: Oct 14, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)

Pytest plugin that creates missing fixtures

pytest-mitmproxy

last release: May 28, 2024, status: N/A, requires: pytest>=7.0

pytest plugin for mitmproxy tests

pytest-ml

last release: May 04, 2019, status: 4 - Beta, requires: N/A

Test your machine learning!

pytest-mocha

last release: Apr 02, 2020, status: 4 - Beta, requires: pytest (>=5.4.0)

pytest plugin to display test execution output like a mochajs

pytest-mock

last release: Mar 21, 2024, status: 5 - Production/Stable, requires: pytest>=6.2.5

Thin-wrapper around the mock package for easier use with pytest

pytest-mock-api

last release: Feb 13, 2019, status: 1 - Planning, requires: pytest (>=4.0.0)

A mock API server with configurable routes and responses available as a fixture.

pytest-mock-generator

last release: May 16, 2022, status: 5 - Production/Stable, requires: N/A

A pytest fixture wrapper for https://pypi.org/project/mock-generator

pytest-mock-helper

last release: Jan 24, 2018, status: N/A, requires: pytest

Help you mock HTTP call and generate mock code

pytest-mockito

last release: Jul 11, 2018, status: 4 - Beta, requires: N/A

Base fixtures for mockito

pytest-mockredis

last release: Jan 02, 2018, status: 2 - Pre-Alpha, requires: N/A

An in-memory mock of a Redis server that runs in a separate thread. This is to be used for unit-tests that require a Redis database.

pytest-mock-resources

last release: Jun 20, 2024, status: N/A, requires: pytest>=1.0

A pytest plugin for easily instantiating reproducible mock resources.

pytest-mock-server

last release: Jan 09, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)

Mock server plugin for pytest
pytest Documentation, Release 8.3

pytest-mockservers
last release: Mar 31, 2020, status: N/A, requires: pytest (>=4.3.0)
A set of fixtures to test your requests to HTTP/UDP servers

pytest-mocktcp
last release: Oct 11, 2022, status: N/A, requires: pytest
A pytest plugin for testing TCP clients

pytest-modal
last release: Feb 27, 2024, status: 4 - Beta, requires: pytest >=6.2.0
Massively distributed pytest runs using modal.com

pytest-modified-env
last release: Jan 29, 2022, status: 4 - Beta, requires: N/A
Pytest plugin to fail a test if it leaves modified `os.environ` afterwards.

pytest-modifyjunit
last release: Jan 10, 2019, status: N/A, requires: N/A
Utility for adding additional properties to junit xml for IDM QE

pytest-molecule
last release: Mar 29, 2022, status: 5 - Production/Stable, requires: pytest (>=7.0.0)
PyTest Molecule Plugin :: discover and run molecule tests

pytest-molecule-JC
last release: Jul 18, 2023, status: 5 - Production/Stable, requires: pytest (>=7.0.0)
PyTest Molecule Plugin :: discover and run molecule tests

pytest-mongo
last release: Mar 13, 2024, status: 5 - Production/Stable, requires: pytest >=6.2
MongoDB process and client fixtures plugin for Pytest.

pytest-mongodb
last release: May 16, 2023, status: 5 - Production/Stable, requires: N/A
pytest plugin for MongoDB fixtures

pytest-monitor
last release: Jun 25, 2023, status: 5 - Production/Stable, requires: pytest
Pytest plugin for analyzing resource usage.

pytest-monkeyplus
last release: Sep 18, 2012, status: 5 - Production/Stable, requires: N/A
pytest's monkeypatch subclass with extra functionalities

pytest-monkeytype
last release: Jul 29, 2020, status: 4 - Beta, requires: N/A
pytest-monkeytype: Generate Monkeytype annotations from your pytest tests.

pytest-moto
last release: Aug 28, 2015, status: 1 - Planning, requires: N/A
Fixtures for integration tests of AWS services, uses moto mocking library.
pytest-motor
  
  A pytest plugin for motor, the non-blocking MongoDB driver.

pytest-mp
  *last release*: May 23, 2018, *status*: 4 - Beta, *requires*: pytest
  
  A test batcher for multiprocessed Pytest runs

pytest-mpi
  *last release*: Jan 08, 2022, *status*: 3 - Alpha, *requires*: pytest
  
  Pytest plugin to collect information from tests

pytest-mpiexec
  *last release*: Apr 13, 2023, *status*: 3 - Alpha, *requires*: pytest
  
  Pytest plugin for running individual tests with mpiexec

pytest-mp
  *last release*: Feb 14, 2024, *status*: 4 - Beta, *requires*: pytest
  
  Pytest plugin to help with testing figures output from Matplotlib

pytest-mproc
  *last release*: Nov 15, 2022, *status*: 4 - Beta, *requires*: pytest (>=6)
  
  Low-startup-overhead, scalable, distributed-testing pytest plugin

pytest-mqtt
  *last release*: May 08, 2024, *status*: 4 - Beta, *requires*: pytest<9; extra == “test”
  
  Pytest-mqtt supports testing systems based on MQTT

pytest-multihost
  *last release*: Apr 07, 2020, *status*: 4 - Beta, *requires*: N/A
  
  Utility for writing multi-host tests for pytest

pytest-multilog
  *last release*: Jan 17, 2023, *status*: N/A, *requires*: pytest
  
  Multi-process logs handling and other helpers for pytest

pytest-multithreading
  *last release*: Dec 07, 2022, *status*: N/A, *requires*: N/A
  
  A pytest plugin for threaded and concurrent testing

pytest-multithreading-allure
  *last release*: Nov 25, 2022, *status*: N/A, *requires*: N/A
  
  Pytest_multithreading_allure

pytest-mutagen
  *last release*: Jul 24, 2020, *status*: N/A, *requires*: pytest (>=5.4)
  
  Add the mutation testing feature to pytest

pytest-my-cool-lib
  *last release*: Nov 02, 2023, *status*: N/A, *requires*: pytest (>=7.1.3,<8.0.0)

pytest-mypy
  *last release*: Dec 18, 2022, *status*: 4 - Beta, *requires*: pytest (>=6.2); python_version >= “3.10”
  
  Mypy static type checker plugin for Pytest
pytest-mypyd
   last release: Aug 20, 2019, status: 4 - Beta, requires: pytest (<4.7,>=2.8) ; python_version < “3.5”
   Mypy static type checker plugin for Pytest

pytest-mypy-plugins
   last release: Mar 31, 2024, status: 4 - Beta, requires: pytest>=7.0.0
   pytest plugin for writing tests for mypy plugins

pytest-mypy-plugins-shim
   last release: Apr 12, 2021, status: N/A, requires: pytest>=6.0.0
   Substitute for “pytest-mypy-plugins” for Python implementations which aren’t supported by mypy.

pytest-mypy-runner
   last release: Apr 23, 2024, status: N/A, requires: pytest>=8.0
   Run the mypy static type checker as a pytest test case

pytest-mypy-testing
   last release: Mar 04, 2024, status: N/A, requires: pytest>=7,<9
   Pytest plugin to check mypy output.

pytest-mysql
   last release: May 23, 2024, status: 5 - Production/Stable, requires: pytest>=6.2
   MySQL process and client fixtures for pytest

pytest-ndb
   last release: Apr 28, 2024, status: N/A, requires: pytest
   pytest notebook debugger

pytest-needle
   last release: Dec 10, 2018, status: 4 - Beta, requires: pytest (<5.0.0,>=3.0.0)
   pytest plugin for visual testing websites using selenium

pytest-neo
   last release: Jan 08, 2022, status: 3 - Alpha, requires: pytest (>=6.2.0)
   pytest-neo is a plugin for pytest that shows tests like screen of Matrix.

pytest-neos
   last release: Jun 11, 2024, status: 1 - Planning, requires: N/A
   Pytest plugin for neos

pytest-netdut
   last release: Mar 07, 2024, status: N/A, requires: pytest <7.3,>=3.5.0
   “Automated software testing for switches using pytest”

pytest-network
   last release: May 07, 2020, status: N/A, requires: N/A
   A simple plugin to disable network on socket level.

pytest-network-endpoints
   last release: Mar 06, 2022, status: N/A, requires: pytest
   Network endpoints plugin for pytest
pytest-never-sleep
  *last release*: May 05, 2021, *status*: 3 - Alpha, *requires*: pytest (>=3.5.1)
  Pytest plugin helps to avoid adding tests without mock `time.sleep`

pytest-nginx
  *last release*: Aug 12, 2017, *status*: 5 - Production/Stable, *requires*: N/A
  nginx fixture for pytest

pytest-nginx-iplweb
  *last release*: Mar 01, 2019, *status*: 5 - Production/Stable, *requires*: N/A
  nginx fixture for pytest - iplweb temporary fork

pytest-ngrok

pytest-ngsfixtures
  *last release*: Sep 06, 2019, *status*: 2 - Pre-Alpha, *requires*: pytest (>=5.0.0)
  Pytest ngs fixtures

pytest-nhsd-apim
  *last release*: Jun 18, 2024, *status*: N/A, *requires*: pytest<9.0.0,>=8.2.0
  Pytest plugin accessing NHSDigital’s APIM proxies

pytest-nice
  *last release*: May 04, 2019, *status*: 4 - Beta, *requires*: pytest
  A pytest plugin that alerts user of failed test cases with screen notifications

pytest-nice-parametrize
  *last release*: Apr 17, 2021, *status*: 5 - Production/Stable, *requires*: N/A
  A small snippet for nicer PyTest’s Parametrize

pytest_nlcov
  *last release*: Apr 11, 2024, *status*: N/A, *requires*: N/A
  Pytest plugin to get the coverage of the new lines (based on git diff) only

pytest-nocustom
  *last release*: Apr 11, 2024, *status*: 5 - Production/Stable, *requires*: N/A
  Run all tests without custom markers

pytest-nodependency
  *last release*: Apr 10, 2024, *status*: 5 - Production/Stable, *requires*: N/A
  Pytest plugin for controlling execution flow

pytest-nodev
  *last release*: Jul 21, 2016, *status*: 4 - Beta, *requires*: pytest (>=2.8.1)
  Test-driven source code search for Python.

pytest-nogarbage
  Ensure a test produces no garbage

pytest-nose-attrib
  *last release*: Aug 13, 2023, *status*: N/A, *requires*: N/A
pytest plugin to use nose @attrib marks decorators and pick tests based on attributes and partially uses nose-attrib plugin approach

pytest_notebook
  last release: Nov 28, 2023, status: 4 - Beta, requires: pytest>=3.5.0
  A pytest plugin for testing Jupyter Notebooks.

pytest-notification
  last release: Jun 19, 2020, status: N/A, requires: pytest (>=4)
  A pytest plugin for sending a desktop notification and playing a sound upon completion of tests

pytest-notifier
  last release: Jun 12, 2020, status: 3 - Alpha, requires: pytest
  A pytest plugin to notify test result

pytest_notify
  last release: Jul 05, 2017, status: N/A, requires: pytest>=3.0.0
  Get notifications when your tests ends

pytest-notimplemented
  last release: Aug 27, 2019, status: N/A, requires: pytest (>=5.1,<6.0)
  Pytest markers for not implemented features and tests.

pytest-notion
  last release: Aug 07, 2019, status: N/A, requires: N/A
  A PyTest Reporter to send test runs to Notion.so

pytest-nunit
  last release: Feb 26, 2024, status: 5 - Production/Stable, requires: N/A
  A pytest plugin for generating NUnit3 test result XML output

pytest-oar
  last release: May 02, 2023, status: N/A, requires: pytest>=6.0.1
  PyTest plugin for the OAR testing framework

pytest-object-getter
  last release: Jul 31, 2022, status: 5 - Production/Stable, requires: pytest
  Import any object from a 3rd party module while mocking its namespace on demand.

pytest-ochrus
  last release: Feb 21, 2018, status: 4 - Beta, requires: N/A
  pytest results data-base and HTML reporter

pytest-odc
  last release: Aug 04, 2023, status: 4 - Beta, requires: pytest (>=3.5.0)
  A pytest plugin for simplifying ODC database tests

pytest-odoo
  last release: Jul 06, 2023, status: 4 - Beta, requires: pytest (>=7.2.0)
  pytest plugin to run Odoo tests
pytest-odoo-fixtures
   last release: Jun 25, 2019, status: N/A, requires: N/A
   Project description

pytest-oerp
   last release: Feb 28, 2012, status: 3 - Alpha, requires: N/A
   pytest plugin to test OpenERP modules

pytest-offline
   last release: Mar 09, 2023, status: 1 - Planning, requires: pytest (>=7.0.0,<8.0.0)

pytest-ogsm-plugin
   last release: May 16, 2023, status: N/A, requires: N/A
   针对特定项目定制化插件, 优化了pytest报告展示方式,并添加了项目所需特定参数

pytest-ok
   last release: Apr 01, 2019, status: 4 - Beta, requires: N/A
   The ultimate pytest output plugin

pytest-only
   last release: May 27, 2024, status: 5 - Production/Stable, requires: pytest<9,>=3.6.0
   Use @pytest.mark.only to run a single test

pytest-oof
   last release: Dec 11, 2023, status: 4 - Beta, requires: N/A
   A Pytest plugin providing structured, programmatic access to a test run's results

pytest-oot
   last release: Sep 18, 2016, status: 4 - Beta, requires: N/A
   Run object-oriented tests in a simple format

pytest-openfiles
   last release: Jun 05, 2024, status: 3 - Alpha, requires: pytest>=4.6
   Pytest plugin for detecting inadvertent open file handles

pytest-opentelemetry
   last release: Oct 01, 2023, status: N/A, requires: pytest
   A pytest plugin for instrumenting test runs via OpenTelemetry

pytest-opentmi
   last release: Jun 02, 2022, status: 5 - Production/Stable, requires: pytest (>=5.0)
   pytest plugin for publish results to opentmi

pytest-operator
   last release: Sep 28, 2022, status: N/A, requires: pytest
   Fixtures for Operators

pytest-optional
   last release: Oct 07, 2015, status: N/A, requires: N/A
   include/exclude values of fixtures in pytest

pytest-optional-tests
   last release: Jul 09, 2019, status: 4 - Beta, requires: pytest (>=4.5.0)
   Easy declaration of optional tests (i.e., that are not run by default)
pytest-orchestration
  *last release: Jul 18, 2019*, *status: N/A*, *requires: N/A*
  A pytest plugin for orchestrating tests

pytest-order
  *last release: Apr 02, 2024*, *status: 4 - Beta*, *requires: pytest>=5.0; python_version < “3.10”*
  pytest plugin to run your tests in a specific order

pytest-ordering
  *last release: Nov 14, 2018*, *status: 4 - Beta*, *requires: pytest*
  pytest plugin to run your tests in a specific order

pytest-order-modify
  *last release: Nov 04, 2022*, *status: N/A*, *requires: N/A*
  新增run_marker 来自定义用例的执行顺序

pytest-osxnotify
  *last release: May 15, 2015*, *status: N/A*, *requires: N/A*
  OS X notifications for py.test results.

pytest-ot
  *last release: Mar 21, 2024*, *status: N/A*, *requires: pytest; extra == “dev”*
  A pytest plugin for instrumenting test runs via OpenTelemetry

pytest-otel
  *last release: Mar 18, 2024*, *status: N/A*, *requires: pytest==8.1.1*
  OpenTelemetry plugin for Pytest

pytest-override-env-var
  *last release: Feb 25, 2023*, *status: N/A*, *requires: N/A*
  Pytest mark to override a value of an environment variable.

pytest-owner
  *last release: Apr 25, 2022*, *status: N/A*, *requires: N/A*
  Add owner mark for tests

pytest-pact
  *last release: Jan 07, 2019*, *status: 4 - Beta*, *requires: N/A*
  A simple plugin to use with pytest

pytest-pahrametahrize
  *last release: Nov 24, 2021*, *status: 4 - Beta*, *requires: pytest (>=6.0,<7.0)*
  Parametrize your tests with a Boston accent.

pytest-parallel
  *last release: Oct 10, 2021*, *status: 3 - Alpha*, *requires: pytest (>=3.0.0)*
  a pytest plugin for parallel and concurrent testing

pytest-parallel-39
  *last release: Jul 12, 2021*, *status: 3 - Alpha*, *requires: pytest (>=3.0.0)*
  a pytest plugin for parallel and concurrent testing
pytest-parallelize-tests
  last release: Jan 27, 2023, status: 4 - Beta, requires: N/A
  pytest plugin that parallelizes test execution across multiple hosts

pytest-param
  last release: Sep 11, 2016, status: 4 - Beta, requires: pytest (>=2.6.0)
  pytest plugin to test all, first, last or random params

pytest-paramark
  last release: Jan 10, 2020, status: 4 - Beta, requires: pytest (>=4.5.0)
  Configure pytest fixtures using a combination of "parametrize" and markers

pytest-parametrization
  last release: May 22, 2022, status: 5 - Production/Stable, requires: N/A
  Simpler PyTest parametrization

pytest-parametrize-cases
  last release: Mar 13, 2022, status: N/A, requires: pytest (>=6.1.2)
  A more user-friendly way to write parametrized tests.

pytest-parametrized
  last release: Nov 03, 2023, status: 5 - Production/Stable, requires: pytest
  Pytest decorator for parametrizing tests with default iterables.

pytest-parametrize-suite
  last release: Jan 19, 2023, status: 5 - Production/Stable, requires: pytest
  A simple pytest extension for creating a named test suite.

pytest_param_files
  last release: Jul 29, 2023, status: N/A, requires: pytest
  Create pytest parametrize decorators from external files.

pytest-param-scope
  last release: Oct 18, 2023, status: N/A, requires: pytest
  pytest parametrize scope fixture workaround

pytest-parawtf
  last release: Dec 03, 2018, status: 4 - Beta, requires: pytest (>=3.6.0)
  Finally spell paramete?ri[sz]e correctly

pytest-pass
  last release: Dec 04, 2019, status: N/A, requires: N/A
  Check out https://github.com/elilutsky/pytest-pass

pytest-passrunner
  last release: Feb 10, 2021, status: 5 - Production/Stable, requires: pytest (>=4.6.0)
  Pytest plugin providing the 'run_on_pass' marker

pytest-paste-config
  last release: Sep 18, 2013, status: 3 - Alpha, requires: N/A
  Allow setting the path to a paste config file

</tbody>
</table>
pytest-pg
last release: May 21, 2024, status: 5 - Production/Stable, requires: pytest>=6.0.0
A tiny plugin for pytest which runs PostgreSQL in Docker

pytest-pgsql
last release: May 13, 2020, status: 5 - Production/Stable, requires: pytest (>=3.0.0)
Pytest plugins and helpers for tests using a Postgres database.

pytest-phmdoctest
last release: Apr 15, 2022, status: 4 - Beta, requires: pytest (>=5.4.3)
pytest plugin to test Python examples in Markdown using phmdoctest.

pytest-picked
last release: Jul 27, 2023, status: N/A, requires: pytest (>=3.7.0)
Run the tests related to the changed files

pytest-pigeonhole
last release: Jun 25, 2018, status: 5 - Production/Stable, requires: pytest (>=3.4)

pytest-pikachu
last release: Aug 05, 2021, status: 5 - Production/Stable, requires: pytest
Show surprise when tests are passing

pytest-pilot
last release: Oct 09, 2020, status: 5 - Production/Stable, requires: N/A
Slice in your test base thanks to powerful markers.

pytest-pingguo-pytest-plugin
last release: Oct 26, 2022, status: 4 - Beta, requires: N/A
pingguo test

pytest-pings
last release: Jun 29, 2019, status: 3 - Alpha, requires: pytest (>=5.0.0)
🦊 The pytest plugin for Firefox Telemetry 🎈

pytest-pinned
last release: Sep 17, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)
A simple pytest plugin for pinning tests

pytest-pinpoint
last release: Sep 25, 2020, status: N/A, requires: pytest (>=4.4.0)
A pytest plugin which runs SBFL algorithms to detect faults.

pytest-pipeline
last release: Jan 24, 2017, status: 3 - Alpha, requires: N/A
Pytest plugin for functional testing of data analysis pipelines

pytest-pitch
last release: Nov 02, 2023, status: 4 - Beta, requires: pytest >=7.3.1
runs tests in an order such that coverage increases as fast as possible

pytest-platform-markers
last release: Sep 09, 2019, status: 4 - Beta, requires: pytest (>=3.6.0)
Markers for pytest to skip tests on specific platforms
pytest-play
last release: Jun 12, 2019, status: 5 - Production/Stable, requires: N/A
pytest plugin that let you automate actions and assertions with test metrics reporting executing plain YAML files

pytest-playbook
last release: Jan 21, 2021, status: 3 - Alpha, requires: pytest (>=6.1.2,<7.0.0)
Pytest plugin for reading playbooks.

pytest-playwright
last release: May 06, 2024, status: N/A, requires: N/A
A pytest wrapper with fixtures for Playwright to automate web browsers

pytest_playwright_async
last release: May 24, 2024, status: N/A, requires: N/A
ASYNC Pytest plugin for Playwright

pytest-playwright-asyncio
last release: Aug 29, 2023, status: N/A, requires: N/A
ASYNCPytestpluginforPlaywright

pytest-playwright-enhanced
last release: Mar 24, 2024, status: N/A, requires: pytest<9.0.0,>=8.0.0
A pytest plugin for playwright python

pytest-playwrights
last release: Dec 02, 2021, status: N/A, requires: N/A
A pytest wrapper with fixtures for Playwright to automate web browsers

pytest-playwright-snapshot
last release: Aug 19, 2021, status: N/A, requires: N/A
A pytest wrapper for snapshot testing with playwright

pytest-playwright-visual
last release: Apr 28, 2022, status: N/A, requires: N/A
A pytest fixture for visual testing with Playwright

pytest-plone
last release: May 15, 2024, status: 3 - Alpha, requires: pytest<8.0.0
Pytest plugin to test Plone addons

pytest-plt
last release: Jan 17, 2024, status: 5 - Production/Stable, requires: pytest
Fixtures for quickly making Matplotlib plots in tests

pytest-plugin-helpers
last release: Nov 23, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
A plugin to help developing and testing other plugins

pytest-plus
last release: Mar 26, 2024, status: 5 - Production/Stable, requires: pytest>=7.4.2
PyTest Plus Plugin :: extends pytest functionality

pytest-pmisc
last release: Mar 21, 2019, status: 5 - Production/Stable, requires: N/A
pytest-pogo

- last release: May 22, 2024, status: 1 - Planning, requires: pytest<9,>=7
  Pytest plugin for pogo-migrate

pytest-pointers

- last release: Dec 26, 2022, status: N/A, requires: N/A
  Pytest plugin to define functions you test with special marks for better navigation and reports

pytest-pokie

- last release: Oct 19, 2023, status: 5 - Production/Stable, requires: N/A
  Pokie plugin for pytest

pytest-polarion-cfme

- last release: Nov 13, 2017, status: 3 - Alpha, requires: N/A
  Pytest plugin for collecting test cases and recording test results

pytest-polarion-collect

- last release: Jun 18, 2020, status: 3 - Alpha, requires: pytest
  Pytest plugin for collecting polarion test cases data

pytest-polecat

- last release: Aug 12, 2019, status: 4 - Beta, requires: N/A
  Provides Polecat pytest fixtures

pytest-ponyorm

- last release: Oct 31, 2018, status: N/A, requires: pytest(>=3.1.1)
  PonyORM in Pytest

pytest-poo

- last release: Mar 25, 2021, status: 5 - Production/Stable, requires: pytest(>=2.3.4)
  Visualize your crappy tests

pytest-poo-fail

- last release: Feb 12, 2015, status: 5 - Production/Stable, requires: N/A
  Visualize your failed tests with poo

pytest-pook

- last release: Feb 15, 2024, status: 4 - Beta, requires: pytest
  Pytest plugin for pook

pytest-pop

- last release: May 09, 2023, status: 5 - Production/Stable, requires: pytest
  A pytest plugin to help with testing pop projects

pytest-porringer

- last release: Jan 18, 2024, status: N/A, requires: pytest>=7.4.4

pytest-portion

- last release: Jan 28, 2021, status: 4 - Beta, requires: pytest(>=3.5.0)
  Select a portion of the collected tests

pytest-postgres

- last release: Mar 22, 2020, status: N/A, requires: pytest
  Run PostgreSQL in Docker container in Pytest.
pytest-postgresql
last release: Mar 11, 2024, status: 5 - Production/Stable, requires: pytest >=6.2
Postgresql fixtures and fixture factories for Pytest.

pytest-power
last release: Dec 31, 2020, status: N/A, requires: pytest (>=5.4)
pytest plugin with powerful fixtures

pytest-powerpack
last release: Mar 17, 2024, status: N/A, requires: pytest (>=8.1.1,<9.0.0)

pytest-prefer-nested-dup-tests
last release: Apr 27, 2022, status: 4 - Beta, requires: pytest (>=7.1.1,<8.0.0)
A Pytest plugin to drop duplicated tests during collection, but will prefer keeping nested packages.

pytest-pretty
last release: Apr 05, 2023, status: 5 - Production/Stable, requires: pytest>=7
pytest plugin for printing summary data as I want it

pytest-pretty-terminal
last release: Jan 31, 2022, status: N/A, requires: pytest (>=3.4.1)
pytest plugin for generating prettier terminal output

pytest-pride
last release: Apr 02, 2016, status: 3 - Alpha, requires: N/A
Minitest-style test colors

pytest-print
last release: Aug 25, 2023, status: 5 - Production/Stable, requires: pytest>=7.4
pytest-print adds the printer fixture you can use to print messages to the user (directly to the pytest runner, not stdout)

pytest-priority
last release: Jul 23, 2023, status: N/A, requires: N/A
pytest plugin for add priority for tests

pytest-proceed
last release: Apr 10, 2024, status: N/A, requires: pytest

pytest-profiles
last release: Dec 09, 2021, status: 4 - Beta, requires: pytest (>=3.7.0)
pytest plugin for configuration profiles

pytest-profiling
last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
Profiling plugin for py.test

pytest-progress
last release: Jun 18, 2024, status: 5 - Production/Stable, requires: pytest>=2.7
pytest plugin for instant test progress status

pytest-prometheus
last release: Oct 03, 2017, status: N/A, requires: N/A
Report test pass / failures to a Prometheus PushGateway
pytest-prometheus-pushgateway

last release: Sep 27, 2022, status: 5 - Production/Stable, requires: pytest
Pytest report plugin for Zulip

pytest-prosper

last release: Sep 24, 2018, status: N/A, requires: N/A
Test helpers for Prosper projects

pytest-prysk

last release: Mar 12, 2024, status: 4 - Beta, requires: pytest (>=7.3.2)
Pytest plugin for prysk

pytest-pspec

last release: Jun 02, 2020, status: 4 - Beta, requires: pytest (>=3.0.0)
A rspec format reporter for Python pytest

pytest-psqlgraph

last release: Oct 19, 2021, status: 4 - Beta, requires: pytest (>=6.0)
Pytest plugin for testing applications that use psqlgraph

pytest-pt

last release: May 15, 2024, status: 4 - Beta, requires: pytest
Pytest plugin to use *.pt files as tests

pytest-ptera

last release: Mar 01, 2022, status: N/A, requires: pytest (>=6.2.4,<7.0.0)
Use ptera probes in tests

pytest-publish

last release: Jun 04, 2024, status: N/A, requires: pytest<9.0.0,>=8.0.0

pytest-pudb

last release: Oct 25, 2018, status: 3 - Alpha, requires: pytest (>=2.0)
Pytest PuDB debugger integration

pytest-pumpkin-spice

last release: Sep 18, 2022, status: 4 - Beta, requires: N/A
A pytest plugin that makes your test reporting pumpkin-spiced

pytest-purkinje

last release: Oct 28, 2017, status: 2 - Pre-Alpha, requires: N/A
Py.test plugin for purkinje test runner

pytest-pusher

last release: Jan 06, 2023, status: 5 - Production/Stable, requires: pytest (>=3.6)
Pytest plugin for push report to minio

pytest-py125

last release: Dec 03, 2022, status: N/A, requires: N/A

pytest-pycharm

last release: Aug 13, 2020, status: 5 - Production/Stable, requires: pytest (>=2.3)
Plugin for py.test to enter PyCharm debugger on uncaught exceptions
pytest Documentation, Release 8.3

pytest-pycodestyle
last release: Oct 28, 2022, status: 3 - Alpha, requires: N/A
pytest plugin to run pycodestyle

pytest-pydev
last release: Nov 15, 2017, status: 3 - Alpha, requires: N/A
py.test plugin to connect to a remote debug server with PyDev or PyCharm.

pytest-pydocstyle
last release: Jan 05, 2023, status: 3 - Alpha, requires: N/A
pytest plugin to run pydocstyle

pytest-pylint
last release: Oct 06, 2023, status: 5 - Production/Stable, requires: pytest >=7.0
pytest plugin to check source code with pylint

pytest-pymysql-autorecord
last release: Sep 02, 2022, status: N/A, requires: N/A
Record PyMySQL queries and mock with the stored data.

pytest-pyodide
last release: Jun 12, 2024, status: N/A, requires: N/A
Pytest plugin for testing applications that use Pyodide

pytest-pypom-navigation
last release: Feb 18, 2019, status: 4 - Beta, requires: pytest (>=3.0.7)
Core engine for cookiecutter-qa and pytest-play packages

pytest-pyppeteer
last release: Apr 28, 2022, status: N/A, requires: pytest (>=6.2.5,<7.0.0)
A plugin to run pyppeteer in pytest

pytest-pyq
last release: Mar 10, 2020, status: 5 - Production/Stable, requires: N/A
Pytest fixture “q” for pyq

pytest-pyramid
last release: Oct 11, 2023, status: 5 - Production/Stable, requires: pytest
pytest_pyramid - provides fixtures for testing pyramid applications with pytest test suite

pytest-pyramid-server
last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
Pyramid server fixture for py.test

pytest-pyreport
last release: May 05, 2024, status: N/A, requires: pytest
PyReport is a lightweight reporting plugin for Pytest that provides concise HTML report
pytest-pyright
last release: Jan 26, 2024, status: 4 - Beta, requires: pytest >= 7.0.0
Pytest plugin for type checking code with Pyright

pytest-pytspec
last release: Jan 02, 2024, status: N/A, requires: pytest (>= 7.2.1, < 8.0.0)
A plugin that transforms the pytest output into a result similar to the RSpec. It enables the use of docstrings to display results and also enables the use of the prefixes “describe”, “with” and “it”.

pytest-pystack
last release: Jan 04, 2024, status: N/A, requires: pytest >= 3.5.0
Plugin to run pystack after a timeout for a test suite.

pytest-pytestrail
last release: Aug 27, 2020, status: 4 - Beta, requires: pytest (>= 3.8.0)
Pytest plugin for interaction with TestRail

pytest-pythonhashseed
last release: Feb 25, 2024, status: 4 - Beta, requires: pytest >= 3.0.0
Pytest plugin to set PYTHONHASHSEED env var.

pytest-pythonpath
last release: Feb 10, 2022, status: 5 - Production/Stable, requires: pytest (< 7, >= 2.5.2)
Pytest plugin for adding to the PYTHONPATH from command line or configs.

pytest-python-test-engineer-sort
last release: May 13, 2024, status: N/A, requires: pytest >= 6.2.0
Sort plugin for Pytest

pytest-pytorch
last release: May 25, 2021, status: 4 - Beta, requires: pytest
Pytest plugin for a better developer experience when working with the PyTorch test suite

pytest-pyvenv
last release: Feb 27, 2024, status: N/A, requires: pytest; extra == ‘test’
A package for create venv in tests

pytest-pyvista
last release: Sep 29, 2023, status: 4 - Beta, requires: pytest >= 3.5.0
Pytest-pyvista package

pytest-qanova
last release: May 26, 2024, status: 3 - Alpha, requires: pytest
A pytest plugin to collect test information

pytest-qaseio
last release: May 30, 2024, status: 4 - Beta, requires: pytest < 9.0.0, >= 7.2.2
Pytest plugin for Qase.io integration

pytest-qasync
last release: Jul 12, 2021, status: 4 - Beta, requires: pytest (>= 5.4.0)
Pytest support for qasync.
pytest-qatouch
last release: Feb 14, 2023, status: 4 - Beta, requires: pytest (>=6.2.0)
Pytest plugin for uploading test results to your QA Touch Testrun.

pytest-qqgis
last release: Jun 14, 2024, status: 5 - Production/Stable, requires: pytest>=6.0
A pytest plugin for testing QGIS python plugins

pytest-qml
last release: Dec 02, 2020, status: 4 - Beta, requires: pytest (>=6.0.0)
Run QML Tests with pytest

pytest-qr
last release: Nov 25, 2021, status: 4 - Beta, requires: N/A
pytest plugin to generate test result QR codes

pytest-qt
last release: Feb 07, 2024, status: 5 - Production/Stable, requires: pytest
pytest support for PyQt and PySide applications

pytest-qt-app
last release: Dec 23, 2015, status: 5 - Production/Stable, requires: N/A
QT app fixture for py.test

pytest-quarantine
last release: Nov 24, 2019, status: 5 - Production/Stable, requires: pytest (>=4.6)
A plugin for pytest to manage expected test failures

pytest-quickcheck
last release: Nov 05, 2022, status: 4 - Beta, requires: pytest (>=4.0)
pytest plugin to generate random data inspired by QuickCheck

pytest_quickify
last release: Jun 14, 2019, status: N/A, requires: pytest
Run test suites with pytest-quickify.

pytest-rabbitmq
last release: May 08, 2024, status: 5 - Production/Stable, requires: pytest>=6.2
RabbitMQ process and client fixtures for pytest

pytest-race
last release: Jun 07, 2022, status: 4 - Beta, requires: N/A
Race conditions tester for pytest

pytest-rage
last release: Oct 21, 2011, status: 3 - Alpha, requires: N/A
pytest plugin to implement PEP712

pytest-rail
last release: May 02, 2022, status: N/A, requires: pytest (>=3.6)
pytest plugin for creating TestRail runs and adding results
pytest-railflow-testrail-reporter

*last release:* Jun 29, 2022, *status:* 5 - Production/Stable, *requires:* pytest

Generate json reports along with specified metadata defined in test markers.

pytest-raises

*last release:* Apr 23, 2020, *status:* N/A, *requires:* pytest (>=3.2.2)

An implementation of pytest.raises as a pytest.mark fixture

pytest-raisesregexp

*last release:* Dec 18, 2015, *status:* N/A, *requires:* N/A

Simple pytest plugin to look for regex in Exceptions

pytest-raisin

*last release:* Feb 06, 2022, *status:* N/A, *requires:* pytest

Plugin enabling the use of exception instances with pytest.raises

pytest-random

*last release:* Apr 28, 2013, *status:* 3 - Alpha, *requires:* N/A

pytest plug-in to randomize tests

pytest-randomly

*last release:* Aug 15, 2023, *status:* 5 - Production/Stable, *requires:* pytest

Pytest plug-in to randomly order tests and control random.seed.

pytest-randomness

*last release:* May 30, 2019, *status:* 3 - Alpha, *requires:* N/A

Pytest plug-in about random seed management

pytest-random-num

*last release:* Oct 19, 2020, *status:* 5 - Production/Stable, *requires:* N/A

Randomise the order in which pytest tests are run with some control over the randomness

pytest-random-order

*last release:* Jan 20, 2024, *status:* 5 - Production/Stable, *requires:* pytest &ge; 3.0.0

Randomise the order in which pytest tests are run with some control over the randomness

pytest-ranking

*last release:* Jun 07, 2024, *status:* 4 - Beta, *requires:* pytest &ge; 7.4.3

A Pytest plugin for automatically prioritizing/ranking tests to speed up failure detection

pytest-readme

*last release:* Sep 02, 2022, *status:* 5 - Production/Stable, *requires:* N/A

Test your README.md file

pytest-reana

*last release:* Mar 14, 2024, *status:* 3 - Alpha, *requires:* N/A

Pytest fixtures for REANA.

pytest-recorder

*last release:* Jun 27, 2024, *status:* N/A, *requires:* N/A

Pytest plugin, meant to facilitate unit tests writing for tools consuming Web APIs.
pytest-recording
*last release:* Dec 06, 2023, *status:* 4 - Beta, *requires:* pytest>=3.5.0
A pytest plugin that allows you recording of network interactions via VCR.py

pytest-recordings
*last release:* Aug 13, 2020, *status:* N/A, *requires:* N/A
Provides pytest plugins for reporting request/response traffic, screenshots, and more to ReportPortal

pytest-redis
*last release:* Jun 19, 2024, *status:* 5 - Production/Stable, *requires:* pytest>=6.2
Redis fixtures and fixture factories for Pytest.

pytest-redislite
*last release:* Apr 05, 2022, *status:* 4 - Beta, *requires:* pytest
Pytest plugin for testing code using Redis

pytest-redmine
*last release:* Mar 19, 2018, *status:* 1 - Planning, *requires:* N/A
Pytest plugin for redmine

pytest-ref
*last release:* Nov 23, 2019, *status:* 4 - Beta, *requires:* pytest (>=3.5.0)
A plugin to store reference files to ease regression testing

pytest-reference-formatter
*last release:* Oct 01, 2019, *status:* 4 - Beta, *requires:* N/A
Conveniently run pytest with a dot-formatted test reference.

pytest-regex
*last release:* May 29, 2023, *status:* 4 - Beta, *requires:* pytest (>=3.5.0)
Select pytest tests with regular expressions

pytest-regex-dependency
*last release:* Jun 12, 2022, *status:* N/A, *requires:* pytest
Management of Pytest dependencies via regex patterns

pytest-regressions
*last release:* Aug 31, 2023, *status:* 5 - Production/Stable, *requires:* pytest >=6.2.0
Easy to use fixtures to write regression tests.

pytest-regrtest
*last release:* Feb 26, 2024, *status:* N/A, *requires:* pytest>7.2
pytest plugin for snapshot regression testing

pytest-relative-order
*last release:* May 17, 2021, *status:* 4 - Beta, *requires:* N/A
A pytest plugin that sorts tests using “before” and “after” markers

pytest-relaxed
*last release:* Mar 29, 2024, *status:* 5 - Production/Stable, *requires:* pytest>=7
Relaxed test discovery/organization for pytest
pytest-remfiles
  last release: Jul 01, 2019, status: 5 - Production/Stable, requires: N/A
  Pytest plugin to create a temporary directory with remote files

pytest-remotedata
  last release: Sep 26, 2023, status: 5 - Production/Stable, requires: pytest >=4.6
  Pytest plugin for controlling remote data access.

pytest-remote-response
  last release: Apr 26, 2023, status: 5 - Production/Stable, requires: pytest (>=4.6)
  Pytest plugin for capturing and mocking connection requests.

pytest-remove-stale-bytecode
  last release: Jul 07, 2023, status: 4 - Beta, requires: pytest
  py.test plugin to remove stale byte code files.

pytest-reorder
  last release: May 31, 2018, status: 4 - Beta, requires: pytest
  Reorder tests depending on their paths and names.

pytest-repeat
  last release: Oct 09, 2023, status: 5 - Production/Stable, requires: pytest
  pytest plugin for repeating tests

pytest_repeater
  last release: Feb 09, 2018, status: 1 - Planning, requires: N/A
  py.test plugin for repeating single test multiple times.

pytest-replay
  last release: Jan 11, 2024, status: 5 - Production/Stable, requires: pytest
  Saves previous test runs and allow re-execute previous pytest runs to reproduce crashes or flaky tests

pytest-repo-health
  last release: Apr 17, 2023, status: 3 - Alpha, requires: pytest
  A pytest plugin to report on repository standards conformance

pytest-report
  last release: May 11, 2016, status: 4 - Beta, requires: N/A
  Creates json report that is compatible with atom.io's linter message format

pytest-reporter
  last release: Feb 28, 2024, status: 4 - Beta, requires: pytest
  Generate Pytest reports with templates

pytest-reporter-html1
  last release: Jun 28, 2024, status: 4 - Beta, requires: N/A
  A basic HTML report template for Pytest

pytest-reporter-html-dots
  last release: Jan 22, 2023, status: N/A, requires: N/A
  A basic HTML report for pytest using Jinja2 template engine.
pytest-reportinfra
  last release: Aug 11, 2019, status: 3 - Alpha, requires: N/A
  Pytest plugin for reportinfra

pytest-reporting
  last release: Oct 25, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
  A plugin to report summarized results in a table format

pytest-reportlog
  last release: May 22, 2023, status: 3 - Alpha, requires: pytest
  Replacement for the –resultlog option, focused in simplicity and extensibility

pytest-report-me
  last release: Dec 31, 2020, status: N/A, requires: pytest
  A pytest plugin to generate report.

pytest-report-parameters
  last release: Jun 18, 2020, status: 3 - Alpha, requires: pytest (>=2.4.2)
  pytest plugin for adding tests’ parameters to junit report

pytest-reportportal
  last release: Mar 27, 2024, status: N/A, requires: pytest>=3.8.0
  Agent for Reporting results of tests to the Report Portal

pytest-report-stream
  last release: Oct 22, 2023, status: 4 - Beta, requires: N/A
  A pytest plugin which allows to stream test reports at runtime

pytest-repo-structure
  last release: Mar 18, 2024, status: 1 - Planning, requires: N/A
  Pytest Repo Structure

pytest-reqs
  last release: May 12, 2019, status: N/A, requires: pytest (>=2.4.2)
  pytest plugin to check pinned requirements

pytest-requests
  last release: Jun 24, 2019, status: 4 - Beta, requires: pytest (>=3.5.0)
  A simple plugin to use with pytest

pytest-requestselapsed
  last release: Aug 14, 2022, status: N/A, requires: N/A
  collect and show http requests elapsed time

pytest-requests-futures
  last release: Jul 06, 2022, status: 5 - Production/Stable, requires: pytest
  Pytest Plugin to Mock Requests Futures

pytest-requirements
  last release: Dec 21, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)
  A pytest plugin to elegantly skip tests with optional requirements
pytest-reraise
last release: Sep 20, 2022, status: 5 - Production/Stable, requires: pytest (>=4.6)
Make multi-threaded pytest test cases fail when they should

pytest-rerun
last release: Jul 08, 2019, status: N/A, requires: pytest (>=3.6)
Re-run only changed files in specified branch

pytest-rerun-all
last release: Nov 16, 2023, status: 3 - Alpha, requires: pytest (>=7.0.0)
Rerun testsuite for a certain time or iterations

pytest-rerun-classfailures
last release: Apr 24, 2024, status: 5 - Production/Stable, requires: pytest>=7.2
pytest rerun class failures plugin

pytest-rerunfailures
last release: Mar 13, 2024, status: 5 - Production/Stable, requires: pytest >=7.2
pytest plugin to re-run tests to eliminate flaky failures

pytest-rerunfailures-all-logs
last release: Mar 07, 2022, status: 5 - Production/Stable, requires: N/A
pytest plugin to re-run tests to eliminate flaky failures

pytest-resartial
last release: May 23, 2024, status: 4 - Beta, requires: pytest
Pytest fixture for recording and replaying serial port traffic.

pytest-resilient-circuits
last release: May 17, 2024, status: N/A, requires: pytest~=4.6; python_version == “2.7”
Resilient Circuits fixtures for PyTest

pytest-resource
last release: Nov 14, 2018, status: 4 - Beta, requires: N/A
Load resource fixture plugin to use with pytest

pytest-resource-path
last release: May 01, 2021, status: 5 - Production/Stable, requires: pytest (>=3.5.0)
Provides path for uniform access to test resources in isolated directory

pytest-resource-usage
last release: Nov 06, 2022, status: 5 - Production/Stable, requires: pytest>=7.0.0
Pytest plugin for reporting running time and peak memory usage

pytest-responsemock
last release: Mar 10, 2022, status: 5 - Production/Stable, requires: N/A
Simplified requests calls mocking for pytest

pytest-responses
last release: Oct 11, 2022, status: N/A, requires: pytest (>=2.5)
pytest integration for responses

pytest-rest-api
last release: Aug 08, 2022, status: N/A, requires: pytest (>=7.1.2,<8.0.0)
pytest-restrict
  last release: Jul 10, 2023, status: 5 - Production/Stable, requires: pytest
  Pytest plugin to restrict the test types allowed

pytest-result-log
  last release: Jan 10, 2024, status: N/A, requires: pytest>=7.2.0
  A pytest plugin that records the start, end, and result information of each use case in a log file

pytest-result-sender
  last release: Apr 20, 2023, status: N/A, requires: pytest>=7.3.1
  
  A Pytest plugin to resuming from the last run test

pytest-rethinkdb
  last release: Jul 24, 2016, status: 4 - Beta, requires: N/A
  A RethinkDB plugin for pytest.

pytest-retry
  last release: May 14, 2024, status: N/A, requires: pytest>=7.0.0
  Adds the ability to retry flaky tests in CI environments

pytest-retry-class
  last release: Mar 25, 2023, status: N/A, requires: pytest (>=5.3)
  A pytest plugin to rerun entire class on failure

pytest-reusable-testcases
  last release: Apr 28, 2023, status: N/A, requires: N/A

pytest-reverse
  last release: Jul 10, 2023, status: 5 - Production/Stable, requires: pytest
  Pytest plugin to reverse test order.

pytest-rich
  last release: Mar 03, 2022, status: 4 - Beta, requires: pytest (>=7.0)
  Leverage rich for richer test session output

pytest-richer
  last release: Oct 27, 2023, status: 3 - Alpha, requires: pytest
  Pytest plugin providing a Rich based reporter.

pytest-rich-reporter
  last release: Feb 17, 2022, status: 1 - Planning, requires: pytest (>=5.0.0)
  A pytest plugin using Rich for beautiful test result formatting.

pytest-richtrace
  last release: Jun 20, 2023, status: N/A, requires: N/A
  A pytest plugin that displays the names and information of the pytest hook functions as they are executed.

pytest-ringo
  last release: Sep 27, 2017, status: 3 - Alpha, requires: N/A
  pytest plugin to test web applications using the Ringo web framework
pytest-rmsis
   last release: Aug 10, 2022, status: N/A, requires: pytest (>=5.3.5)
   Synchronise pytest results to Jira RMsis

pytest-rng
   last release: Aug 08, 2019, status: 5 - Production/Stable, requires: pytest
   Fixtures for seeding tests and making randomness reproducible

pytest-roast
   last release: Nov 09, 2022, status: 5 - Production/Stable, requires: pytest
   pytest plugin for ROAST configuration override and fixtures

pytest_robotframework
   last release: Jun 07, 2024, status: N/A, requires: pytest<9,>=7
   a pytest plugin that can run both python and robotframework tests while generating robot reports for them

pytest-rocketchat
   last release: Apr 18, 2021, status: 5 - Production/Stable, requires: N/A
   Pytest to Rocket.Chat reporting plugin

pytest-rotest
   last release: Sep 08, 2019, status: N/A, requires: pytest (>=3.5.0)
   Pytest integration with rotest

pytest-rpc
   last release: Feb 22, 2019, status: 4 - Beta, requires: pytest (~=3.6)
   Extend py.test for RPC OpenStack testing.

pytest-rst
   last release: Jan 26, 2023, status: N/A, requires: N/A
   Test code from RST documents with pytest

pytest-rt
   last release: May 05, 2022, status: N/A, requires: N/A
   pytest data collector plugin for Testgr

pytest-rts
   last release: May 17, 2021, status: N/A, requires: pytest
   Coverage-based regression test selection (RTS) plugin for pytest

pytest-ruff
   last release: May 02, 2024, status: 4 - Beta, requires: pytest>=5
   pytest plugin to check ruff requirements.

pytest-run-changed
   last release: Apr 02, 2021, status: 3 - Alpha, requires: pytest
   Pytest plugin that runs changed tests only

pytest-runfailed
   last release: Mar 24, 2016, status: N/A, requires: N/A
   implement a -failed option for pytest
pytest-run-subprocess
   last release: Nov 12, 2022, status: 5 - Production/Stable, requires: pytest
   Pytest Plugin for running and testing subprocesses.

pytest-runtime-types
   last release: Feb 09, 2023, status: N/A, requires: pytest
   Checks type annotations on runtime while running tests.

pytest-runtime-xfail
   last release: Aug 26, 2021, status: N/A, requires: pytest>=5.0.0
   Call runtime_xfail() to mark running test as xfail.

pytest-runtime-yoyo
   last release: Jun 12, 2023, status: N/A, requires: pytest (>=7.2.0)
   run case mark timeout

pytest-saccharin
   last release: Oct 31, 2022, status: 3 - Alpha, requires: N/A
   pytest-saccharin is a updated fork of pytest-sugar, a plugin for pytest that changes the default look and feel of pytest (e.g. progressbar, show tests that fail instantly).

pytest-salt
   last release: Jan 27, 2020, status: 4 - Beta, requires: N/A
   Pytest Salt Plugin

pytest-salt-containers
   last release: Nov 09, 2016, status: 4 - Beta, requires: N/A
   A Pytest plugin that builds and creates docker containers

pytest-salt-factories
   last release: Mar 22, 2024, status: 5 - Production/Stable, requires: pytest>=7.0.0
   Pytest Salt Plugin

pytest-salt-from-filenames
   last release: Jan 29, 2019, status: 4 - Beta, requires: pytest (>=4.1)
   Simple PyTest Plugin For Salt's Test Suite Specifically

pytest-salt-runtests-bridge
   last release: Dec 05, 2019, status: 4 - Beta, requires: pytest (>=4.1)
   Simple PyTest Plugin For Salt's Test Suite Specifically

pytest-sample-argvalues
   last release: May 07, 2024, status: N/A, requires: pytest
   A utility function to help choose a random sample from your argvalues in pytest.

pytest-sanic
   last release: Oct 25, 2021, status: N/A, requires: pytest (>=5.2)
   a pytest plugin for Sanic

pytest-sanity
   last release: Dec 07, 2020, status: N/A, requires: N/A

pytest-sa-pg
   last release: May 14, 2019, status: N/A, requires: N/A
pytest_sauce
  last release: Jul 14, 2014, status: 3 - Alpha, requires: N/A
  pytest_sauce provides sane and helpful methods worked out in clearcode to run py.test tests with selenium/saucelabs

pytest-sbase
  last release: Jun 29, 2024, status: 5 - Production/Stable, requires: N/A
  A complete web automation framework for end-to-end testing.

pytest-scenario
  last release: Feb 06, 2017, status: 3 - Alpha, requires: N/A
  pytest plugin for test scenarios

pytest-scenario-files
  last release: May 19, 2024, status: 5 - Production/Stable, requires: pytest>=7.2.0
  A pytest plugin that generates unit test scenarios from data files.

pytest-schedule
  last release: Jan 07, 2023, status: 5 - Production/Stable, requires: N/A
  The job of test scheduling for humans.

pytest-schema
  last release: Feb 16, 2024, status: 5 - Production/Stable, requires: pytest >=3.5.0
  ✔️ Validate return values against a schema-like object in testing

pytest-screenshot-on-failure
  last release: Jul 21, 2023, status: 4 - Beta, requires: N/A
  Saves a screenshot when a test case from a pytest execution fails

pytest-securestore
  last release: Nov 08, 2021, status: 4 - Beta, requires: N/A
  An encrypted password store for use within pytest cases

pytest-select
  last release: Jan 18, 2019, status: 3 - Alpha, requires: pytest (>=3.0)
  A pytest plugin which allows to (de-)select tests from a file.

pytest-selenium
  last release: Feb 01, 2024, status: 5 - Production/Stable, requires: pytest>=6.0.0
  pytest plugin for Selenium

pytest-selenium-auto
  last release: Nov 07, 2023, status: N/A, requires: pytest >= 7.0.0
  pytest plugin to automatically capture screenshots upon selenium webdriver events

pytest-seleniumbase
  last release: Jun 29, 2024, status: 5 - Production/Stable, requires: N/A
  A complete web automation framework for end-to-end testing.

pytest-selenium-enhancer
  last release: Apr 29, 2022, status: 5 - Production/Stable, requires: N/A
  pytest plugin for Selenium
pytest-selenium-pdiff
last release: Apr 06, 2017, status: 2 - Pre-Alpha, requires: N/A
A pytest package implementing perceptualdiff for Selenium tests.

pytest-selfie
last release: Apr 05, 2024, status: N/A, requires: pytest<9.0.0,>=8.0.0
A pytest plugin for selfie snapshot testing.

pytest-send-email
last release: Dec 04, 2019, status: N/A, requires: N/A
Send pytest execution result email

pytest-sentry
last release: Apr 25, 2024, status: N/A, requires: pytest
A pytest plugin to send testrun information to Sentry.io

pytest-sequence-markers
last release: May 23, 2023, status: 5 - Production/Stable, requires: N/A
Pytest plugin for sequencing markers for execution of tests

pytest-server
last release: Jun 24, 2024, status: N/A, requires: N/A
test server exec cmd

pytest-server-fixtures
last release: Dec 19, 2023, status: 5 - Production/Stable, requires: pytest
Extensible server fixtures for py.test

pytest-serverless
last release: May 09, 2022, status: 4 - Beta, requires: N/A
Automatically mocks resources from serverless.yml in pytest using moto.

pytest-servers
last release: Jun 17, 2024, status: 3 - Alpha, requires: pytest>=6.2
pytest servers

pytest-service
last release: May 11, 2024, status: 5 - Production/Stable, requires: pytest>=6.0.0

pytest-services
last release: Oct 30, 2020, status: 6 - Mature, requires: N/A
Services plugin for pytest testing framework

pytest-session2file
last release: Jan 26, 2021, status: 3 - Alpha, requires: pytest
pytest-session2file (aka: pytest-session_to_file for v0.1.0 - v0.1.2) is a py.test plugin for capturing and saving to file the stdout of py.test.

pytest-session-fixture-globalize
last release: May 15, 2018, status: 4 - Beta, requires: N/A
py.test plugin to make session fixtures behave as if written in conftest, even if it is written in some modules

pytest-session_to_file
last release: Oct 01, 2015, status: 3 - Alpha, requires: N/A
pytest-session_to_file is a py.test plugin for capturing and saving to file the stdout of py.test.

**pytest-setupinfo**
- last release: Jan 23, 2023, status: N/A, requires: N/A
- Displaying setup info during pytest command run

**pytest-sftpserver**
- last release: Sep 16, 2019, status: 4 - Beta, requires: N/A
- py.test plugin to locally test sftp server connections.

**pytest-shard**
- last release: Dec 11, 2020, status: 4 - Beta, requires: pytest

**pytest-share-hdf**
- last release: Sep 21, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
- Plugin to save test data in HDF files and retrieve them for comparison

**pytest-sharkreport**
- last release: Jul 11, 2022, status: N/A, requires: pytest (>=3.5)
- this is pytest report plugin.

**pytest-shell**
- last release: Mar 27, 2022, status: N/A, requires: N/A
- A pytest plugin to help with testing shell scripts / black box commands

**pytest-shell-utilities**
- last release: Feb 23, 2024, status: 5 - Production/Stable, requires: pytest >=7.4.0
- Pytest plugin to simplify running shell commands against the system

**pytest-sheraf**
- last release: Feb 11, 2020, status: N/A, requires: pytest
- Versatile ZODB abstraction layer - pytest fixtures

**pytest-sherlock**
- last release: Aug 14, 2023, status: 5 - Production/Stable, requires: pytest >=3.5.1
- pytest plugin help to find coupled tests

**pytest-shortcuts**
- last release: Oct 29, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
- Expand command-line shortcuts listed in pytest configuration

**pytest-shutil**
- last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
- A goodie-bag of unix shell and environment tools for py.test

**pytest-simbind**
- last release: Mar 28, 2024, status: N/A, requires: pytest>=7.0.0
- Pytest plugin to operate with objects generated by Simbind tool.

**pytest-simplehttpserver**
- last release: Jun 24, 2021, status: 4 - Beta, requires: N/A
- Simple pytest fixture to spin up an HTTP server
pytest-simple-plugin
  last release: Nov 27, 2019, status: N/A, requires: N/A
  Simple pytest plugin

pytest-simple-settings
  last release: Nov 17, 2020, status: 4 - Beta, requires: pytest
  Simple-settings plugin for pytest

pytest-single-file-logging
  last release: May 05, 2016, status: 4 - Beta, requires: pytest (>=2.8.1)
  Allow for multiple processes to log to a single file

pytest-skip-markers
  last release: Jan 04, 2024, status: 5 - Production/Stable, requires: pytest >=7.1.0
  Pytest Salt Plugin

pytest-skipper
  last release: Mar 26, 2017, status: 3 - Alpha, requires: pytest (>=3.0.6)
  A plugin that selects only tests with changes in execution path

pytest-skippy
  last release: Jan 27, 2018, status: 3 - Alpha, requires: pytest (>=2.3.4)
  Automatically skip tests that don't need to run!

pytest-skip-slow
  last release: Feb 09, 2023, status: N/A, requires: pytest>=6.2.0
  A pytest plugin to skip `@pytest.mark.slow` tests by default.

pytest-skipuntil
  last release: Nov 25, 2023, status: 4 - Beta, requires: pytest >=3.8.0
  A simple pytest plugin to skip flapping test with deadline

pytest-slack
  last release: Dec 15, 2020, status: 5 - Production/Stable, requires: N/A
  Pytest to Slack reporting plugin

pytest-slow
  last release: Sep 28, 2021, status: N/A, requires: N/A
  A pytest plugin to skip `@pytest.mark.slow` tests by default.

pytest-slowest-first
  last release: Dec 11, 2022, status: 4 - Beta, requires: N/A
  Sort tests by their last duration, slowest first

pytest-slow-first
  last release: Jan 30, 2024, status: 4 - Beta, requires: pytest >=3.5.0
  Prioritize running the slowest tests first.

pytest-slow-last
  last release: Dec 10, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)
  Run tests in order of execution time (faster tests first)

</table>
pytest-sofaepione
  last release: Aug 17, 2022, status: N/A, requires: N/A
  Test the installation of SOFA and the SofaEpione plugin.

pytest-soft-assertions
  last release: May 05, 2020, status: 3 - Alpha, requires: pytest

pytest-solr
  last release: May 11, 2020, status: 3 - Alpha, requires: pytest (>=3.0.0)
  Solr process and client fixtures for py.test.

pytest-sort
  last release: Jan 07, 2024, status: N/A, requires: pytest >=7.4.0
  Tools for sorting test cases

pytest-sorter
  last release: Apr 20, 2021, status: 4 - Beta, requires: pytest (>=3.1.1)
  A simple plugin to first execute tests that historically failed more

pytest-sosu
  last release: Aug 04, 2023, status: 2 - Pre-Alpha, requires: pytest
  Unofficial PyTest plugin for Sauce Labs

pytest-sourceorder
  last release: Sep 01, 2021, status: 4 - Beta, requires: pytest
  Test-ordering plugin for pytest

pytest-spark
  last release: Feb 23, 2020, status: 4 - Beta, requires: pytest
  pytest plugin to run the tests with support of pyspark.

pytest-spawner
  last release: Jul 31, 2015, status: 4 - Beta, requires: N/A
  py.test plugin to spawn process and communicate with them.

pytest-spec
  last release: May 04, 2021, status: N/A, requires: N/A
  Library pytest-spec is a pytest plugin to display test execution output like a SPECIFICATION.

pytest-spec2md
  last release: Apr 10, 2024, status: N/A, requires: pytest>7.0
  Library pytest-spec2md is a pytest plugin to create a markdown specification while running pytest.

pytest-speed
  last release: Jan 22, 2023, status: 3 - Alpha, requires: pytest>=7
  Modern benchmarking library for python with pytest integration.

pytest-sphinx
  last release: Apr 13, 2024, status: 4 - Beta, requires: pytest>=8.1.1
  Doctest plugin for pytest with support for Sphinx-specific doctest-directives
pytest-spiratest
last release: Jan 01, 2024, status: N/A, requires: N/A
Exports unit tests as test runs in Spira (SpiraTest/Team/Plan)

pytest-splinter
last release: Sep 09, 2022, status: 6 - Mature, requires: pytest (>=3.0.0)
Splinter plugin for pytest testing framework

pytest-splinter4
last release: Feb 01, 2024, status: 6 - Mature, requires: pytest >=8.0.0
Pytest plugin for the splinter automation library

pytest-split
last release: Jun 19, 2024, status: 4 - Beta, requires: pytest<9,>=5
Pytest plugin which splits the test suite to equally sized sub suites based on test execution time.

pytest-split-ext
last release: Sep 23, 2023, status: 4 - Beta, requires: pytest (>=5,<8)
Pytest plugin which splits the test suite to equally sized sub suites based on test execution time.

pytest-splitio
last release: Sep 22, 2020, status: N/A, requires: pytest (<7,>=5.0)
Split.io SDK integration for e2e tests

pytest-split-tests
last release: Jul 30, 2021, status: 5 - Production/Stable, requires: pytest (>=2.5)
A Pytest plugin for running a subset of your tests by splitting them in to equally sized groups. Forked from Mark Adams’ original project pytest-test-groups.

pytest-split-tests-tresorit
last release: Feb 22, 2021, status: 1 - Planning, requires: N/A

pytest-splunk-addon
last release: Jun 26, 2024, status: N/A, requires: pytest<8,>=5.4.0
A Dynamic test tool for Splunk Apps and Add-ons

pytest-splunk-addon-ui-smartx
last release: Jun 14, 2024, status: N/A, requires: N/A
Library to support testing Splunk Add-on UX

pytest-splunk-env
last release: Oct 22, 2020, status: N/A, requires: pytest (>=6.1.1,<7.0.0)
ytest fixtures for interaction with Splunk Enterprise and Splunk Cloud

pytest-sqitch
last release: Apr 06, 2020, status: 4 - Beta, requires: N/A
sqitch for pytest

pytest-sqlalchemy
last release: Mar 13, 2018, status: 3 - Alpha, requires: N/A
pytest plugin with sqlalchemy related fixtures

pytest-sqlalchemy-mock
last release: May 21, 2024, status: 3 - Alpha, requires: pytest>=7.0.0
pytest sqlalchemy plugin for mock

**pytest-sqlalchemy-session**

*last release*: May 19, 2023, *status*: 4 - Beta, *requires*: pytest (>=7.0)

A pytest plugin for preserving test isolation that use SQLAlchemy.

**pytest-sql-bigquery**

Yet another SQL-testing framework for BigQuery provided by pytest plugin.

**pytest-sqlfluff**

*last release*: Dec 21, 2022, *status*: 4 - Beta, *requires*: pytest (>=3.5.0)

A pytest plugin to use sqlfluff to enable format checking of sql files.

**pytest-squadcast**

Pytest report plugin for Squadcast.

**pytest-srcpaths**

Add paths to sys.path

**pytest-ssh**

pytest plugin for ssh command run

**pytest-start-from**

*last release*: Apr 11, 2016, *status*: N/A, *requires*: N/A

Start pytest run from a given point

**pytest-star-track-issue**

*last release*: Feb 20, 2024, *status*: N/A, *requires*: N/A

A package to prevent Dependency Confusion attacks against Yandex.

**pytest-static**

*last release*: Jun 20, 2024, *status*: 1 - Planning, *requires*: pytest<8.0.0,>=7.4.3

pytest-static

**pytest-statsd**

*last release*: Nov 30, 2018, *status*: 5 - Production/Stable, *requires*: pytest (>=3.0.0)

pytest plugin for reporting to graphite

**pytest-stepfunctions**

*last release*: May 08, 2021, *status*: 4 - Beta, *requires*: pytest

A small description

**pytest-steps**

*last release*: Sep 23, 2021, *status*: 5 - Production/Stable, *requires*: N/A

Create step-wise / incremental tests in pytest.

**pytest-stepwise**

*last release*: Dec 01, 2015, *status*: 4 - Beta, *requires*: N/A

Run a test suite one failing test at a time.
pytest-stf
  last release: Mar 25, 2024, status: N/A, requires: pytest>=5.0
  pytest plugin for openSTF

pytest-stoq
  last release: Feb 09, 2021, status: 4 - Beta, requires: N/A
  A plugin to pytest stoq

pytest-store
  last release: Nov 16, 2023, status: 3 - Alpha, requires: pytest (>=7.0.0)
  Pytest plugin to store values from test runs

pytest-stress
  last release: Dec 07, 2019, status: 4 - Beta, requires: pytest (>=3.6.0)
  A Pytest plugin that allows you to loop tests for a user defined amount of time.

pytest-structlog
  last release: Jun 09, 2024, status: N/A, requires: pytest
  Structured logging assertions

pytest-structmpd
  last release: Oct 17, 2018, status: N/A, requires: N/A
  provide structured temporary directory

pytest-stub
  last release: Apr 28, 2020, status: 5 - Production/Stable, requires: N/A
  Stub packages, modules and attributes.

pytest-subprocess
  last release: Sep 17, 2018, status: 3 - Alpha, requires: pytest (>=3.5.0)
  Provide stub implementations for subprocesses in Python tests

pytest-study
  last release: Sep 26, 2017, status: 3 - Alpha, requires: pytest (>=2.0)
  A pytest plugin to organize long run tests (named studies) without interfering the regular tests

pytest-subinterpreter
  last release: Nov 25, 2023, status: N/A, requires: pytest>=7.0.0
  Run pytest in a subinterpreter

pytest-subprocess
  last release: Jan 28, 2023, status: 5 - Production/Stable, requires: pytest (>=4.0.0)
  A plugin to fake subprocess for pytest

pytest-subtesthack
  last release: Jul 16, 2022, status: N/A, requires: N/A
  A hack to explicitly set up and tear down fixtures.

pytest-subtests
  last release: Mar 07, 2024, status: 4 - Beta, requires: pytest >=7.0
  unittest subTest() support and subtests fixture

3.2. Pytest Plugin List 225
pytest-subunit

last release: Sep 17, 2023, status: N/A, requires: pytest (>=2.3)

pytest-subunit is a plugin for py.test which outputs test results in subunit format.

pytest-sugar

last release: Feb 01, 2024, status: 4 - Beta, requires: pytest >=6.2.0

pytest-sugar is a plugin for pytest that changes the default look and feel of pytest (e.g. progressbar, show tests that fail instantly).

pytest-suitemanager

last release: Apr 28, 2023, status: 4 - Beta, requires: N/A

A simple plugin to use with pytest

pytest-suite-timeout

last release: Jan 26, 2024, status: N/A, requires: pytest>=7.0.0

A pytest plugin for ensuring max suite time

pytest-supercov

last release: Jul 02, 2023, status: N/A, requires: N/A

Pytest plugin for measuring explicit test-file to source-file coverage

pytest-svn

last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest

SVN repository fixture for py.test

pytest-symbols

last release: Nov 20, 2017, status: 3 - Alpha, requires: N/A

pytest-symbols is a pytest plugin that adds support for passing test environment symbols into pytest tests.

pytest-synodic

last release: Mar 09, 2024, status: N/A, requires: pytest>=8.0.2

Synodic Pytest utilities

pytest-system-statistics

last release: Feb 16, 2022, status: 5 - Production/Stable, requires: pytest (>=6.0.0)

Pytest plugin to track and report system usage statistics

pytest-system-test-plugin

last release: Feb 03, 2022, status: N/A, requires: N/A

Pyst - Pytest System-Test Plugin

pytest_tagging

last release: Apr 08, 2024, status: N/A, requires: pytest<8.0.0,>=7.1.3

a pytest plugin to tag tests

pytest-talisket

last release: Feb 15, 2023, status: N/A, requires: N/A

Fixtures for ansible, testinfra and molecule

pytest-talisker

last release: Nov 28, 2021, status: N/A, requires: N/A

pytest-tally

last release: May 22, 2023, status: 4 - Beta, requires: pytest (>=6.2.5)
A Pytest plugin to generate realtime summary stats, and display them in-console using a text-based dashboard.

**pytest-tap**
*last release: Jul 15, 2023, status: 5 - Production/Stable, requires: pytest (>=3.0)*

Test Anything Protocol (TAP) reporting plugin for pytest

**pytest-tape**
*last release: Mar 17, 2021, status: 4 - Beta, requires: N/A*

easy assertion with expected results saved to yaml files

**pytest-target**
*last release: Jan 21, 2021, status: 3 - Alpha, requires: pytest (>=6.1.2,<7.0.0)*

Pytest plugin for remote target orchestration.

**pytest-tblineinfo**
*last release: Dec 01, 2015, status: 3 - Alpha, requires: pytest (>=2.0)*

tblineinfo is a py.test plugin that insert the node id in the final py.test report when --tb=line option is used

**pytest-tcpclient**
*last release: Nov 16, 2022, status: N/A, requires: pytest (<8,>=7.1.3)*

A pytest plugin for testing TCP clients

**pytest-tdd**
*last release: Aug 18, 2023, status: 4 - Beta, requires: N/A*

run pytest on a python module

**pytest-teamcity-logblock**
*last release: May 15, 2018, status: 4 - Beta, requires: N/A*

py.test plugin to introduce block structure in teamcity build log, if output is not captured

**pytest-telegram**
*last release: Apr 25, 2024, status: 5 - Production/Stable, requires: N/A*

Pytest to Telegram reporting plugin

**pytest-telegram-notifier**
*last release: Jun 27, 2023, status: 5 - Production/Stable, requires: N/A*

Telegram notification plugin for Pytest

**pytest-tempdir**
*last release: Oct 11, 2019, status: 4 - Beta, requires: pytest (>=2.8.1)*

Predictable and repeatable tempdir support.

**pytest-terra-fixt**
*last release: Sep 15, 2022, status: N/A, requires: pytest (==6.2.5)*

Terraform and Terragrunt fixtures for pytest

**pytest-terraform**
*last release: May 21, 2024, status: N/A, requires: pytest>=6.0*

A pytest plugin for using terraform fixtures

**pytest-terraform-fixture**
*last release: Nov 14, 2018, status: 4 - Beta, requires: N/A*

generate terraform resources to use with pytest
pytest-testbook

last release: Dec 11, 2016, status: 3 - Alpha, requires: N/A

A plugin to run tests written in Jupyter notebook

pytest-testconfig

last release: Jan 11, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)

Test configuration plugin for pytest.

pytest-testdirectory

last release: May 02, 2023, status: 5 - Production/Stable, requires: pytest

A py.test plugin providing temporary directories in unit tests.

pytest-testdox

last release: Jul 22, 2023, status: 5 - Production/Stable, requires: pytest (>=4.6.0)

A testdox format reporter for pytest

pytest-test-grouping

last release: Feb 01, 2023, status: 5 - Production/Stable, requires: pytest (>=2.5)

A Pytest plugin for running a subset of your tests by splitting them in to equally sized groups.

pytest-test-groups

last release: Oct 25, 2016, status: 5 - Production/Stable, requires: N/A

A Pytest plugin for running a subset of your tests by splitting them in to equally sized groups.

pytest-testinfra

last release: May 26, 2024, status: 5 - Production/Stable, requires: pytest>=6

Test infrastructures

pytest-testinfra-jpic

last release: Sep 21, 2023, status: 5 - Production/Stable, requires: N/A

Test infrastructures

pytest-testinfra-winrm-transport

last release: Sep 21, 2023, status: 5 - Production/Stable, requires: N/A

Test infrastructures

pytest-testlink-adaptor

last release: Dec 20, 2018, status: 4 - Beta, requires: pytest (>=2.6)

pytest reporting plugin for testlink

pytest-testmon

last release: Feb 27, 2024, status: 4 - Beta, requires: pytest <9,>=5

selects tests affected by changed files and methods

pytest-testmon-dev

last release: Mar 30, 2023, status: 4 - Beta, requires: pytest (<8,>=5)

selects tests affected by changed files and methods

pytest-testmon-oc

last release: Jun 01, 2022, status: 4 - Beta, requires: pytest (<8,>=5)

nOly selects tests affected by changed files and methods

pytest Documentation, Release 8.3

pytest-testreport
last release: Dec 01, 2022, status: 4 - Beta, requires: pytest (>=3.5.0)

pytest-testreport-new
last release: Oct 07, 2023, status: 4 - Beta, requires: pytest >=3.5.0

pytest-testsslide
last release: Jan 07, 2021, status: 5 - Production/Stable, requires: pytest (<=6.2)
TestSlide fixture for pytest

pytest-test-this
last release: Sep 15, 2019, status: 2 - Pre-Alpha, requires: pytest (>=2.3)
Plugin for py.test to run relevant tests, based on naively checking if a test contains a reference to the symbol you supply

pytest-test-tracer-for-pytest
last release: Jun 28, 2024, status: 4 - Beta, requires: pytest>=6.2.0
A plugin that allows coll test data for use on Test Tracer

pytest-test-utils
last release: Feb 08, 2024, status: N/A, requires: pytest >=3.9

pytest-test-results
last release: Feb 15, 2024, status: 5 - Production/Stable, requires: pytest >=3.5.0
Test results plugin for pytest

pytest-textual-snapshot
last release: Aug 23, 2023, status: 4 - Beta, requires: pytest (>=7.0.0)
Snapshot testing for Textual apps

pytest-tezos
last release: Jan 16, 2020, status: 4 - Beta, requires: N/A

pytest-ligo

pytest-tf
last release: May 29, 2024, status: N/A, requires: pytest<9.0.0,>=8.2.1
Test your OpenTofu and Terraform config using a PyTest plugin

pytest-th2-bdd
last release: May 13, 2022, status: N/A, requires: N/A
pytest_th2_bdd

pytest-thawgun
last release: May 26, 2020, status: 3 - Alpha, requires: N/A
Pytest plugin for time travel

pytest-thread
last release: Jul 07, 2023, status: N/A, requires: N/A

pytest-threadleak
last release: Jul 03, 2022, status: 4 - Beta, requires: pytest (>=3.1.1)
Detects thread leaks

pytest-tick
last release: Aug 31, 2021, status: 5 - Production/Stable, requires: pytest (>=6.2.5,<7.0.0)
Ticking on tests

**pytest-time**
- *last release:* Jun 24, 2023, *status:* 3 - Alpha, *requires:* pytest

**pytest-timeassert-ethan**
- *last release:* Dec 25, 2023, *status:* N/A, *requires:* pytest
  - execution duration

**pytest-time**
- *last release:* Oct 13, 2016, *status:* 4 - Beta, *requires:* N/A
  - A pytest plugin to time test function runs

**pytest-timeout**
- *last release:* Mar 07, 2024, *status:* 5 - Production/Stable, *requires:* pytest >= 7.0.0
  - pytest plugin to abort hanging tests

**pytest-timeouts**
- *last release:* Sep 21, 2019, *status:* 5 - Production/Stable, *requires:* N/A
  - Linux-only Pytest plugin to control durations of various test case execution phases

**pytest-timer**
- *last release:* Dec 26, 2023, *status:* N/A, *requires:* pytest
  - A timer plugin for pytest

**pytest-timestamps**
- *last release:* Sep 11, 2023, *status:* N/A, *requires:* pytest (>= 7.3,< 8.0)
  - A simple plugin to view timestamps for each test

**pytest-tiny-api-client**
- *last release:* Jan 04, 2024, *status:* 5 - Production/Stable, *requires:* pytest
  - The companion pytest plugin for tiny-api-client

**pytest-tinybird**
- *last release:* Jun 26, 2023, *status:* 4 - Beta, *requires:* pytest (>= 3.8.0)
  - A pytest plugin to report test results to tinybird

**pytest-tipsi-django**
- *last release:* Feb 05, 2024, *status:* 5 - Production/Stable, *requires:* pytest >= 6.0.0
  - Better fixtures for django

**pytest-tipsi-testing**
- *last release:* Feb 04, 2024, *status:* 5 - Production/Stable, *requires:* pytest >= 3.3.0
  - Better fixtures management. Various helpers

**pytest-tldr**
- *last release:* Oct 26, 2022, *status:* 4 - Beta, *requires:* pytest (>= 3.5.0)
  - A pytest plugin that limits the output to just the things you need.
pytest Documentation, Release 8.3

pytest-tm4j-reporter
  last release: Sep 01, 2020, status: N/A, requires: pytest
  Cloud Jira Test Management (TM4J) PyTest reporter plugin

pytest-tmnet
  last release: Mar 01, 2022, status: N/A, requires: N/A
  A small example package

pytest-tmp-files
  last release: Dec 08, 2023, status: N/A, requires: pytest
  Utilities to create temporary file hierarchies in pytest.

pytest-tmpfs
  last release: Aug 29, 2022, status: N/A, requires: pytest
  A pytest plugin that helps you on using a temporary filesystem for testing.

pytest-tmreport
  last release: Aug 12, 2022, status: N/A, requires: N/A
  this is a vue-element ui report for pytest

pytest-tmux
  last release: Apr 22, 2023, status: 4-Beta, requires: N/A
  A pytest plugin that enables tmux driven tests

pytest-todo
  last release: May 23, 2019, status: 4 - Beta, requires: pytest
  A small plugin for the pytest testing framework, marking TODO comments as failure

pytest-tomato
  last release: Mar 01, 2019, status: 5 - Production/Stable, requires: N/A

pytest-toolbelt
  last release: Aug 12, 2019, status: 3 - Alpha, requires: N/A
  This is just a collection of utilities for pytest, but don’t really belong in pytest proper.

pytest-toolbox
  last release: Apr 07, 2018, status: N/A, requires: pytest (>=3.5.0)
  Numerous useful plugins for pytest.

pytest-toolkit
  last release: Jun 07, 2024, status: N/A, requires: N/A
  Useful utils for testing

pytest-tools
  last release: Oct 21, 2022, status: 4 - Beta, requires: N/A
  Pytest tools

pytest-topo
  last release: Jun 05, 2024, status: N/A, requires: pytest>=7.0.0
  Topological sorting for pytest

pytest-tornado
  last release: Jun 17, 2020, status: 5 - Production/Stable, requires: pytest (>=3.6)
  A py.test plugin providing fixtures and markers to simplify testing of asynchronous tornado applications.
pytest-tornado5
  last release: Nov 16, 2018, status: 5 - Production/Stable, requires: pytest (>=3.6)
  A py.test plugin providing fixtures and markers to simplify testing of asynchronous tornado applications.

pytest-tornado-yen3
  last release: Oct 15, 2018, status: 5 - Production/Stable, requires: N/A
  A py.test plugin providing fixtures and markers to simplify testing of asynchronous tornado applications.

pytest-tornasync
  last release: Jul 15, 2019, status: 3 - Alpha, requires: pytest (>=3.0)
  py.test plugin for testing Python 3.5+ Tornado code

pytest-trace
  last release: Jun 19, 2022, status: N/A, requires: pytest (>=4.6)
  Save OpenTelemetry spans generated during testing

pytest-track
  last release: Feb 26, 2021, status: 3 - Alpha, requires: pytest (>=3.0)

pytest-translations
  last release: Sep 11, 2023, status: 5 - Production/Stable, requires: pytest (>=7)
  Test your translation files.

pytest-travis-fold
  last release: Nov 29, 2017, status: 4 - Beta, requires: pytest (>=2.6.0)
  Folds captured output sections in Travis CI build log

pytest-trello
  last release: Nov 20, 2015, status: 5 - Production/Stable, requires: N/A
  Plugin for py.test that integrates trello using markers

pytest-trepan
  last release: Jul 28, 2018, status: 5 - Production/Stable, requires: N/A
  Pytest plugin for trepan debugger.

pytest-trialtemp
  last release: Jun 08, 2015, status: N/A, requires: N/A
  py.test plugin for using the same _trial_temp working directory as trial

pytest-trio
  last release: Nov 01, 2022, status: N/A, requires: pytest (>=7.2.0)
  Pytest plugin for trio

pytest-trytond
  last release: Nov 04, 2022, status: 4 - Beta, requires: pytest (>=5)
  Pytest plugin for the Tryton server framework

pytest-tspwplib
  last release: Jan 08, 2021, status: 4 - Beta, requires: pytest (>=3.5.0)
  A simple plugin to use with tspwplib

pytest-tst
  last release: Apr 27, 2022, status: N/A, requires: pytest (>=5.0.0)
  Customize pytest options, output and exit code to make it compatible with tst
pytest-tstcls
  last release: Mar 23, 2020, status: 5 - Production/Stable, requires: N/A
  Test Class Base

pytest-tui
  last release: Dec 08, 2023, status: 4 - Beta, requires: N/A
  Text User Interface (TUI) and HTML report for Pytest test runs

pytest-tutorials
  last release: Mar 11, 2023, status: N/A, requires: N/A

pytest-twilio-conversations-client-mock
  last release: Aug 02, 2022, status: N/A, requires: N/A

pytest-twisted
  last release: Mar 19, 2024, status: 5 - Production/Stable, requires: pytest >=2.3
  A twisted plugin for pytest.

pytest-typechecker
  last release: Feb 04, 2022, status: N/A, requires: pytest (>=6.2.5,<7.0.0)
  Run type checkers on specified test files

pytest-typhoon-config
  last release: Apr 07, 2022, status: 5 - Production/Stable, requires: N/A
  A Typhoon HIL plugin that facilitates test parameter configuration at runtime

pytest-typhoon-polarion
  last release: Feb 01, 2024, status: 4 - Beta, requires: N/A
  Typhoon test plugin for Siemens Polarion

pytest-typhoon-xray
  last release: Aug 15, 2023, status: 4 - Beta, requires: N/A
  Typhoon HIL plugin for pytest

pytest-tytest
  last release: May 25, 2020, status: 4 - Beta, requires: pytest (>=5.4.2)
  Typhoon HIL plugin for pytest

pytest-ubersmith
  last release: Apr 13, 2015, status: N/A, requires: N/A
  Easily mock calls to ubersmith at the `requests` level.

pytest-ui
  last release: Jul 05, 2021, status: 4 - Beta, requires: pytest
  Text User Interface for running python tests

pytest-ui-failed-screenshot
  last release: Dec 06, 2022, status: N/A, requires: N/A
  UI自动测试失败时自动截图，并将截图加入到测试报告中

pytest-ui-failed-screenshot-allure
  last release: Dec 06, 2022, status: N/A, requires: N/A
  UI自动测试失败时自动截图，并将截图加入到Allure测试报告中
pytest-uncollect-if
last release: Mar 24, 2024, status: 4 - Beta, requires: pytest>=6.2.0
A plugin to uncollect pytests tests rather than using skipif

pytest-unflakable
last release: Apr 30, 2024, status: 4 - Beta, requires: pytest>=6.2.0
Unflakable plugin for PyTest

pytest-unhandled-exception-exit-code
last release: Jun 22, 2020, status: 5 - Production/Stable, requires: pytest (>=2.3)
Plugin for py.test set a different exit code on uncaught exceptions

pytest-unique
last release: Sep 15, 2023, status: N/A, requires: pytest (>=7.4.2,<8.0.0)
Pytest fixture to generate unique values.

pytest-unittest-filter
last release: Jan 12, 2019, status: 4 - Beta, requires: pytest (>=3.1.0)
A pytest plugin for filtering unittest-based test classes

pytest-unmarked
last release: Aug 27, 2019, status: 5 - Production/Stable, requires: N/A
Run only unmarked tests

pytest-unordered
last release: Mar 13, 2024, status: 4 - Beta, requires: pytest >=7.0.0
Test equality of unordered collections in pytest

pytest-unstable
last release: Sep 27, 2022, status: 4 - Beta, requires: N/A
Set a test as unstable to return 0 even if it failed

pytest-unused-fixtures
last release: Apr 08, 2024, status: 4 - Beta, requires: pytest>7.3.2
A pytest plugin to list unused fixtures after a test run.

pytest-upload-report
last release: Jun 18, 2021, status: 5 - Production/Stable, requires: N/A
pytest-upload-report is a plugin for pytest that upload your test report for test results.

pytest-utils
last release: Feb 02, 2023, status: 4 - Beta, requires: pytest (>=7.0.0,<8.0.0)
Some helpers for pytest.

pytest-vagrant
last release: Sep 07, 2021, status: 5 - Production/Stable, requires: pytest
A py.test plugin providing access to vagrant.

pytest-valgrind
last release: May 19, 2021, status: N/A, requires: N/A

pytest-variables
last release: Feb 01, 2024, status: 5 - Production/Stable, requires: pytest>=7.0.0
pytest plugin for providing variables to tests/fixtures
pytest-variant
  last release: Jun 06, 2022, status: N/A, requires: N/A
  Variant support for Pytest

pytest-vcr
  last release: Apr 26, 2019, status: 5 - Production/Stable, requires: pytest (>=3.6.0)
  Plugin for managing VCR.py cassettes

pytest-vcr-delete-on-fail
  last release: Feb 16, 2024, status: 5 - Production/Stable, requires: pytest (>=8.0.0,<9.0.0)
  A pytest plugin that automates vcrpy cassettes deletion on test failure.

pytest-vcrpandas
  last release: Jan 12, 2019, status: 4 - Beta, requires: pytest
  Test from HTTP interactions to dataframe processed.

pytest-vcs
  last release: Sep 22, 2022, status: 4 - Beta, requires: N/A

pytest-venv
  last release: Nov 23, 2023, status: 4 - Beta, requires: pytest
  py.test fixture for creating a virtual environment

pytest-verbose-parametrize
  last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
  More descriptive output for parametrized py.test tests

pytest-vimqf
  last release: Feb 08, 2021, status: 4 - Beta, requires: pytest (>=6.2.2,<7.0.0)
  A simple pytest plugin that will shrink pytest output when specified, to fit vim quickfix window.

pytest-virtualenv
  last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
  Virtualenv fixture for py.test

pytest-visual
  last release: Nov 01, 2023, status: 3 - Alpha, requires: pytest >=7.0.0

pytest-vnc
  last release: Nov 06, 2023, status: N/A, requires: pytest
  VNC client for Pytest

pytest-voluptuous
  last release: Jun 09, 2020, status: N/A, requires: pytest
  Pytest plugin for asserting data against voluptuous schema.

pytest-vscodedebug
  last release: Dec 04, 2020, status: 4 - Beta, requires: N/A
  A pytest plugin to easily enable debugging tests within Visual Studio Code

pytest-vscode-pycharm-cls
  last release: Feb 01, 2023, status: N/A, requires: pytest
  A PyTest helper to enable start remote debugger on test start or failure or when pytest.set_trace is used.
3.2. Pytest Plugin List

pytest-vts
last release: Jun 05, 2019, status: N/A, requires: pytest (>=2.3)
pytest plugin for automatic recording of http stubbed tests

pytest-vulture
last release: Jun 01, 2023, status: N/A, requires: pytest (>=7.0.0)
A pytest plugin to checks dead code with vulture

pytest-vw
last release: Oct 07, 2015, status: 4 - Beta, requires: N/A
pytest-vw makes your failing test cases succeed under CI tools scrutiny

pytest-vyper
last release: May 28, 2020, status: 2 - Pre-Alpha, requires: N/A
Plugin for the vyper smart contract language.

pytest-wa-e2e-plugin
last release: Feb 18, 2020, status: 4 - Beta, requires: pytest (>=3.5.0)
Pytest plugin for testing whatsapp bots with end to end tests

pytest-wake
last release: Mar 20, 2024, status: N/A, requires: pytest

pytest-watch
last release: May 20, 2018, status: N/A, requires: N/A
Local continuous test runner with pytest and watchdog.

pytest-watcher
last release: Apr 01, 2024, status: 4 - Beta, requires: N/A
Automatically rerun your tests on file modifications

pytest_wdb
last release: Jul 04, 2016, status: N/A, requires: N/A
Trace pytest tests with wdb to halt on error with –wdb.

pytest-wdl
last release: Nov 17, 2020, status: 5 - Production/Stable, requires: N/A
Pytest plugin for testing WDL workflows.

pytest-web3-data
last release: Oct 04, 2023, status: 4 - Beta, requires: pytest
A pytest plugin to fetch test data from IPFS HTTP gateways during pytest execution.

pytest-webdriver
last release: May 28, 2019, status: 5 - Production/Stable, requires: pytest
Selenium webdriver fixture for py.test

pytest-webtest-extras
last release: Jun 08, 2024, status: N/A, requires: pytest>=7.0.0
Pytest plugin to enhance pytest-html and allure reports of webtest projects by adding screenshots, comments and webpage sources.

pytest-wetest
last release: Nov 10, 2018, status: 4 - Beta, requires: N/A
Welian API Automation test framework pytest plugin

**pytest-when**
- **last release:** May 28, 2024, **status:** N/A, **requires:** pytest(>=7.3.1)
- Utility which makes mocking more readable and controllable

**pytest-whirlwind**
- **last release:** Jun 12, 2020, **status:** N/A, **requires:** N/A
- Testing Tornado.

**pytest-wholenodeid**
- **last release:** Aug 26, 2015, **status:** 4 - Beta, **requires:** pytest(>=2.0)
- pytest addon for displaying the whole node id for failures

**pytest-win32consoletitle**
- **last release:** Aug 08, 2021, **status:** N/A, **requires:** N/A
- Pytest progress in console title (Win32 only)

**pytest-winnotify**
- **last release:** Apr 22, 2016, **status:** N/A, **requires:** N/A
- Windows tray notifications for py.test results.

**pytest-wiremock**
- **last release:** Mar 27, 2022, **status:** N/A, **requires:** pytest(>=7.1.1,<8.0.0)
- A pytest plugin for programmatically using wiremock in integration tests

**pytest-with-docker**
- **last release:** Nov 09, 2021, **status:** N/A, **requires:** pytest
- pytest with docker helpers.

**pytest-workflow**
- **last release:** Mar 18, 2024, **status:** 5 - Production/Stable, **requires:** pytest(>=7.0.0)
- A pytest plugin for configuring workflow/pipeline tests using YAML files

**pytest-xdist**
- **last release:** Apr 28, 2024, **status:** 5 - Production/Stable, **requires:** pytest(>=7.0.0)
- pytest xdist plugin for distributed testing, most importantly across multiple CPUs

**pytest-xdist-debug-for-graingert**
- **last release:** Jul 24, 2019, **status:** 5 - Production/Stable, **requires:** pytest(>=4.4.0)
- pytest xdist plugin for distributed testing and loop-on-failing modes

**pytest-xdist-forked**
- **last release:** Feb 10, 2020, **status:** 5 - Production/Stable, **requires:** pytest(>=4.4.0)
- forked from pytest-xdist

**pytest-xdist-tracker**
- **last release:** Nov 18, 2021, **status:** 3 - Alpha, **requires:** pytest(>=3.5.1)
- pytest plugin helps to reproduce failures for particular xdist node

**pytest-xdist-worker-stats**
- **last release:** Apr 16, 2024, **status:** 4 - Beta, **requires:** pytest(>=7.0.0)
- A pytest plugin to list worker statistics after a xdist run.
pytest-xfaillist
last release: Sep 17, 2021, status: N/A, requires: pytest (>=6.2.2,<7.0.0)
Maintain a xfaillist in an additional file to avoid merge-conflicts.

pytest-xfiles
last release: Feb 27, 2018, status: N/A, requires: N/A
Pytest fixtures providing data read from function, module or package related (x)files.

pytest-xiuyu
last release: Jul 25, 2023, status: 5 - Production/Stable, requires: N/A
This is a pytest plugin

pytest-xlog
last release: May 31, 2020, status: 4 - Beta, requires: N/A
Extended logging for test and decorators

pytest-xlsx
last release: Apr 23, 2024, status: N/A, requires: pytest~>=7.0
pytest plugin for generating test cases by xlsx(excel)

pytest-xpara
last release: Oct 30, 2017, status: 3 - Alpha, requires: pytest
An extended parametrizing plugin of pytest.

pytest-xprocess
last release: May 19, 2024, status: 4 - Beta, requires: pytest>=2.8
A pytest plugin for managing processes across test runs.

pytest-xray
last release: May 30, 2019, status: 3 - Alpha, requires: pytest

pytest-xrayjira
last release: Mar 17, 2020, status: 3 - Alpha, requires: pytest (==4.3.1)

pytest-xray-server
last release: May 03, 2022, status: 3 - Alpha, requires: pytest (>5.3.1)

pytest-xskynet
last release: Feb 20, 2024, status: N/A, requires: N/A
A package to prevent Dependency Confusion attacks against Yandex.

pytest-xstress
last release: Jun 01, 2024, status: N/A, requires: pytest<9.0.0,>=8.0.0

pytest-xvfb
last release: May 29, 2023, status: 4 - Beta, requires: pytest (>=2.8.1)
A pytest plugin to run Xvfb (or Xephyr/Xvnc) for tests.

pytest-xvirt
last release: Oct 01, 2023, status: 4 - Beta, requires: pytest >=7.1.0
A pytest plugin to virtualize test. For example to transparently running them on a remote box.

pytest-yaml
last release: Oct 05, 2018, status: N/A, requires: pytest
This plugin is used to load yaml output to your test using pytest framework.
pytest-yaml-sanmu
  last release: Apr 23, 2024, status: N/A, requires: pytest>=7.4.0
  pytest plugin for generating test cases by yaml

pytest-yamltree
  last release: Mar 02, 2020, status: 4 - Beta, requires: pytest (>=3.1.1)
  Create or check file/directory trees described by YAML

pytest-yamltree
  last release: May 11, 2010, status: N/A, requires: N/A
  Run tests against wsgi apps defined in yaml

pytest-yaml-yoyo
  last release: Jun 19, 2023, status: N/A, requires: pytest (>=7.2.0)
  http/https API run by yaml

pytest-yapf
  last release: Jul 06, 2017, status: 4 - Beta, requires: pytest (>=3.1.1)
  Run yapf

pytest-yapf3
  last release: Mar 29, 2023, status: 5 - Production/Stable, requires: pytest (>=7)
  Validate your Python file format with yapf

pytest-yield
  last release: Jan 23, 2019, status: N/A, requires: N/A
  PyTest plugin to run tests concurrently, each 'yield' switch context to other one

pytest-yls
  last release: Mar 30, 2024, status: N/A, requires: pytest<8.0.0,>=7.2.2
  Pytest plugin to test the YLS as a whole.

pytest-youqu-playwright
  last release: Jun 12, 2024, status: N/A, requires: pytest
  pytest-youqu-playwright

pytest-yuk
  last release: Mar 26, 2021, status: N/A, requires: pytest>=5.0.0
  Display tests you are uneasy with, using 🕹️/🗑️ for pass/fail of tests marked with yuk.

pytest-zafira
  last release: Sep 18, 2019, status: 5 - Production/Stable, requires: pytest (==4.1.1)
  A Zafira plugin for pytest

pytest-zap
  last release: May 12, 2014, status: 4 - Beta, requires: N/A
  OWASP ZAP plugin for py.test.

pytest-zecc
  last release: Jun 02, 2024, status: N/A, requires: N/A
  eee
pytest-zebrunner

last release: Jan 08, 2024, status: 5 - Production/Stable, requires: pytest (>=4.5.0)

Pytest connector for Zebrunner reporting

pytest-zebe

last release: Feb 01, 2024, status: N/A, requires: pytest (>=7.4.2,<8.0.0)

Pytest fixtures for testing Camunda 8 processes using a Zeebe test engine.

pytest-zest

last release: Nov 17, 2022, status: N/A, requires: N/A

Zesty additions to pytest.

pytest-zhongwen-wendang

last release: Mar 04, 2024, status: 4 - Beta, requires: N/A

PyTest 中文文档

pytest-zigzag

last release: Feb 27, 2019, status: 4 - Beta, requires: pytest (~=3.6)

Extend py.test for RPC OpenStack testing.

pytest-zulip

last release: May 07, 2022, status: 5 - Production/Stable, requires: pytest

Pytest report plugin for Zulip

pytest-zy

last release: Mar 24, 2024, status: N/A, requires: pytest~=7.2.0

接口自动化测试框架

3.3 Configuration

3.3.1 Command line options and configuration file settings

You can get help on command line options and values in INI-style configurations files by using the general help option:

```
pytest -h  # prints options _and_ config file settings
```

This will display command line and configuration file settings which were registered by installed plugins.

3.3.2 Configuration file formats

Many pytest settings can be set in a configuration file, which by convention resides in the root directory of your repository.

A quick example of the configuration files supported by pytest:

pytest.ini

pytest.ini files take precedence over other files, even when empty.
Alternatively, the hidden version .pytest.ini can be used.

```ini
# pytest.ini or .pytest.ini
[pytest]
minversion = 6.0
addopts = -ra -q
testpaths =
    tests
    integration
```

pyproject.toml

Added in version 6.0.

pyproject.toml are considered for configuration when they contain a tool.pytest.ini_options table.

```toml
# pyproject.toml
[tool.pytest.ini_options]
minversion = "6.0"
addopts = "-ra -q"
testpaths = [
    "tests",
    "integration",
]
```

Note: One might wonder why [tool.pytest.ini_options] instead of [tool.pytest] as is the case with other tools.
The reason is that the pytest team intends to fully utilize the rich TOML data format for configuration in the future, reserving the [tool.pytest] table for that. The ini_options table is being used, for now, as a bridge between the existing .ini configuration system and the future configuration format.

tox.ini

tox.ini files are the configuration files of the tox project, and can also be used to hold pytest configuration if they have a [pytest] section.

```ini
# tox.ini
[pytest]
minversion = 6.0
addopts = -ra -q
testpaths =
    tests
    integration
```
setup.cfg

setup.cfg files are general purpose configuration files, used originally by distutils (now deprecated) and setup-tools, and can also be used to hold pytest configuration if they have a [tool:pytest] section.

```ini
# setup.cfg
[tool:pytest]
minversion = 6.0
addopts = -ra -q
testpaths =
    tests
    integration
```

**Warning:** Usage of setup.cfg is not recommended unless for very simple use cases. .cfg files use a different parser than pytest.ini and tox.ini which might cause hard to track down problems. When possible, it is recommended to use the latter files, or pyproject.toml, to hold your pytest configuration.

### 3.3.3 Initialization: determining rootdir and configfile

pytest determines a rootdir for each test run which depends on the command line arguments (specified test files, paths) and on the existence of configuration files. The determined rootdir and configfile are printed as part of the pytest header during startup.

Here’s a summary what pytest uses rootdir for:

- Construct nodeids during collection; each test is assigned a unique nodeid which is rooted at the rootdir and takes into account the full path, class name, function name and parametrization (if any).
- Is used by plugins as a stable location to store project/test run specific information; for example, the internal cache plugin creates a .pytest_cache subdirectory in rootdir to store its cross-test run state.

rootdir is **NOT** used to modify sys.path/PYTHONPATH or influence how modules are imported. See pytest import mechanisms and sys.path/PYTHONPATH for more details.

The --rootdir=path command-line option can be used to force a specific directory. Note that contrary to other command-line options, --rootdir cannot be used with addopts inside pytest.ini because the rootdir is used to find pytest.ini already.

**Finding the rootdir**

Here is the algorithm which finds the rootdir from args:

- If `-c` is passed in the command-line, use that as configuration file, and its directory as rootdir.
- Determine the common ancestor directory for the specified args that are recognised as paths that exist in the file system. If no such paths are found, the common ancestor directory is set to the current working directory.
- Look for pytest.ini, pyproject.toml, tox.ini, and setup.cfg files in the ancestor directory and upwards. If one is matched, it becomes the configfile and its directory becomes the rootdir.
- If no configuration file was found, look for setup.py upwards from the common ancestor directory to determine the rootdir.
- If no setup.py was found, look for pytest.ini, pyproject.toml, tox.ini, and setup.cfg in each of the specified args and upwards. If one is matched, it becomes the configfile and its directory becomes the rootdir.
• If no `configfile` was found and no configuration argument is passed, use the already determined common ancestor as root directory. This allows the use of pytest in structures that are not part of a package and don’t have any particular configuration file.

If no `args` are given, pytest collects test below the current working directory and also starts determining the `rootdir` from there.

Files will only be matched for configuration if:

- `pytest.ini`: will always match and take precedence, even if empty.
- `tox.ini`: contains a `[pytest]` section.

Finally, a `pyproject.toml` file will be considered the `configfile` if no other match was found, in this case even if it does not contain a `[tool.pytest.ini_options]` table (this was added in 8.1).

The files are considered in the order above. Options from multiple `configfiles` candidates are never merged - the first match wins.

The configuration file also determines the value of the `rootpath`.

The `Config` object (accessible via hooks or through the `pytestconfig` fixture) will subsequently carry these attributes:

- `config.rootpath`: the determined root directory, guaranteed to exist. It is used as a reference directory for constructing test addresses (“nodeids”) and can be used also by plugins for storing per-testrun information.
- `config.inipath`: the determined `configfile`, may be `None` (it is named `inipath` for historical reasons).

Added in version 6.1: The `config.rootpath` and `config.inipath` properties. They are `pathlib.Path` versions of the older `config.rootdir` and `config.inifile`, which have type `py.path.local`, and still exist for backward compatibility.

Example:

```bash
pytest path/to/testdir path/other/
```

will determine the common ancestor as `path` and then check for configuration files as follows:

```bash
# first look for pytest.ini files
path/pytest.ini
path/pyproject.toml  # must contain a [tool.pytest.ini_options] table to match
path/tox.ini         # must contain [pytest] section to match
path/setup.cfg       # must contain [tool:pytest] section to match
pytest.ini
...  # all the way up to the root

# now look for setup.py
path/setup.py
setup.py
...  # all the way up to the root
```

**Warning:** Custom pytest plugin commandline arguments may include a path, as in `pytest --log-output ../../test.log` args. Then `args` is mandatory, otherwise pytest uses the folder of `test.log` for rootdir determination (see also [#1435]). A dot . for referencing to the current working directory is also possible.
3.3.4 Builtin configuration file options

For the full list of options consult the reference documentation.

3.3.5 Syntax highlighting theme customization

The syntax highlighting themes used by pytest can be customized using two environment variables:

- `PYTEST_THEME` sets a Pygment style to use.
- `PYTEST_THEME_MODE` sets this style to light or dark.

3.4 API Reference

This page contains the full reference to pytest's API.

3.4.1 Constants

**pytest.__version__**

The current pytest version, as a string:

```python
>>> import pytest
>>> pytest.__version__
'7.0.0'
```

**pytest.version_tuple**

Added in version 7.0.

The current pytest version, as a tuple:

```python
>>> import pytest
>>> pytest.version_tuple
(7, 0, 0)
```

For pre-releases, the last component will be a string with the prerelease version:

```python
>>> import pytest
>>> pytest.version_tuple
(7, 0, '0rc1')
```
3.4.2 Functions

**pytest.approx**

*approx* *(expected, rel=None, abs=None, nan_ok=False)*

Assert that two numbers (or two ordered sequences of numbers) are equal to each other within some tolerance.

Due to the [Floating Point Arithmetic: Issues and Limitations](https://docs.python.org/3/library/fpformat.html#issues-and-limitations), numbers that we would intuitively expect to be equal are not always so:

```python
>>> 0.1 + 0.2 == 0.3
False
```

This problem is commonly encountered when writing tests, e.g. when making sure that floating-point values are what you expect them to be. One way to deal with this problem is to assert that two floating-point numbers are equal to within some appropriate tolerance:

```python
>>> abs((0.1 + 0.2) - 0.3) < 1e-6
True
```

However, comparisons like this are tedious to write and difficult to understand. Furthermore, absolute comparisons like the one above are usually discouraged because there's no tolerance that works well for all situations. $1e-6$ is good for numbers around 1, but too small for very big numbers and too big for very small ones. It's better to express the tolerance as a fraction of the expected value, but relative comparisons like that are even more difficult to write correctly and concisely.

The *approx* class performs floating-point comparisons using a syntax that's as intuitive as possible:

```python
>>> from pytest import approx
>>> 0.1 + 0.2 == approx(0.3)
True
```

The same syntax also works for ordered sequences of numbers:

```python
>>> {0.1 + 0.2, 0.2 + 0.4} == approx((0.3, 0.6))
True
```

**numpy arrays:**

```python
>>> import numpy as np
>>> np.array([0.1, 0.2]) + np.array([0.2, 0.4]) == approx(np.array([0.3, 0.6]))
True
```

And for a numpy array against a scalar:

```python
>>> import numpy as np
>>> np.array([0.1, 0.2]) + np.array([0.2, 0.1]) == approx(0.3)
True
```

Only ordered sequences are supported, because *approx* needs to infer the relative position of the sequences without ambiguity. This means sets and other unordered sequences are not supported.

Finally, dictionary *values* can also be compared:

```python
>>> {'a': 0.1 + 0.2, 'b': 0.2 + 0.4} == approx({'a': 0.3, 'b': 0.6})
True
```
The comparison will be true if both mappings have the same keys and their respective values match the expected tolerances.

**Tolerances**

By default, `approx` considers numbers within a relative tolerance of $1e^{-6}$ (i.e. one part in a million) of its expected value to be equal. This treatment would lead to surprising results if the expected value was 0.0, because nothing but 0.0 itself is relatively close to 0.0. To handle this case less surprisingly, `approx` also considers numbers within an absolute tolerance of $1e^{-12}$ of its expected value to be equal. Infinity and NaN are special cases. Infinity is only considered equal to itself, regardless of the relative tolerance. NaN is not considered equal to anything by default, but you can make it be equal to itself by setting the `nan_ok` argument to True. (This is meant to facilitate comparing arrays that use NaN to mean “no data”.)

Both the relative and absolute tolerances can be changed by passing arguments to the `approx` constructor:

```python
>>> 1.0001 == approx(1)
False
>>> 1.0001 == approx(1, rel=1e-3)
True
>>> 1.0001 == approx(1, abs=1e-3)
True
```

If you specify `abs` but not `rel`, the comparison will not consider the relative tolerance at all. In other words, two numbers that are within the default relative tolerance of $1e^{-6}$ will still be considered unequal if they exceed the specified absolute tolerance. If you specify both `abs` and `rel`, the numbers will be considered equal if either tolerance is met:

```python
>>> 1 + 1e-8 == approx(1)
True
>>> 1 + 1e-8 == approx(1, abs=1e-12)
False
>>> 1 + 1e-8 == approx(1, rel=1e-6, abs=1e-12)
True
```

You can also use `approx` to compare nonnumeric types, or dicts and sequences containing nonnumeric types, in which case it falls back to strict equality. This can be useful for comparing dicts and sequences that can contain optional values:

```python
>>> {"required": 1.0000005, "optional": None} == approx({"required": 1, "optional ←": None})
True
>>> [None, 1.0000005] == approx([None, 1])
True
>>> ["foo", 1.0000005] == approx([None, 1])
False
```

If you’re thinking about using `approx`, then you might want to know how it compares to other good ways of comparing floating-point numbers. All of these algorithms are based on relative and absolute tolerances and should agree for the most part, but they do have meaningful differences:

- `math.isclose(a, b, rel_tol=1e-9, abs_tol=0.0)`: True if the relative tolerance is met w.r.t. either a or b or if the absolute tolerance is met. Because the relative tolerance is calculated w.r.t. both a and b, this test is symmetric (i.e. neither a nor b is a “reference value”). You have to specify an absolute tolerance if you want to compare to 0.0 because there is no tolerance by default. More information: `math.isclose()`.

- `numpy.isclose(a, b, rtol=1e-5, atol=1e-8)`: True if the difference between a and b is less than the sum of the relative tolerance w.r.t. b and the absolute tolerance. Because the relative tolerance
is only calculated w.r.t. \( b \), this test is asymmetric and you can think of \( b \) as the reference value. Support for comparing sequences is provided by `numpy.allclose()`. More information: `numpy.isclose()`.

- `unittest.TestCase.assertAlmostEqual(a, b)`: True if \( a \) and \( b \) are within an absolute tolerance of \( 1e-7 \). No relative tolerance is considered, so this function is not appropriate for very large or very small numbers. Also, it's only available in subclasses of `unittest.TestCase` and it's ugly because it doesn't follow PEP8. More information: `unittest.TestCase.assertAlmostEqual()`.

- \( a == \text{pytest.approx}(b, \text{rel}=1e-6, \text{abs}=1e-12) \): True if the relative tolerance is met w.r.t. \( b \) or if the absolute tolerance is met. Because the relative tolerance is only calculated w.r.t. \( b \), this test is asymmetric and you can think of \( b \) as the reference value. In the special case that you explicitly specify an absolute tolerance but not a relative tolerance, only the absolute tolerance is considered.

**Note:** `approx` can handle numpy arrays, but we recommend the specialised test helpers in Test support (numpy.testing) if you need support for comparisons, NaNs, or ULP-based tolerances.

To match strings using regex, you can use `Matches` from the re_assert package.

---

**Warning:** Changed in version 3.2.

In order to avoid inconsistent behavior, `TypeError` is raised for `>`, `>=`, `<` and `<=` comparisons. The example below illustrates the problem:

```python
assert approx(0.1) > 0.1 + 1e-10  # calls approx(0.1).__gt__(0.1 + 1e-10)
assert 0.1 + 1e-10 > approx(0.1)  # calls approx(0.1).__lt__(0.1 + 1e-10)
```

In the second example one expects `approx(0.1).__le__(0.1 + 1e-10)` to be called. But instead, `approx(0.1).__lt__(0.1 + 1e-10)` is used to comparison. This is because the call hierarchy of rich comparisons follows a fixed behavior. More information: `object.__ge__()`

Changed in version 3.7.1: `approx` raises `TypeError` when it encounters a dict value or sequence element of nonnumeric type.

Changed in version 6.1.0: `approx` falls back to strict equality for nonnumeric types instead of raising `TypeError`.

### `pytest.fail`

**Tutorial:** How to use `skip` and `xfail` to deal with tests that cannot succeed

```python
fail(reason[, pytrace=True, msg=None])
```

Explicitly fail an executing test with the given message.

**Parameters**

- `reason (str)` – The message to show the user as reason for the failure.

- `pytrace (bool)` – If False, `msg` represents the full failure information and no python traceback will be reported.

**Raises**

`pytest.fail.Exception` – The exception that is raised.

```python
class pytest.fail.Exception
```

The exception raised by `pytest.fail()`.
**pytest.skip**

`skip(reason[, allow_module_level=False, msg=None])`

Skip an executing test with the given message.

This function should be called only during testing (setup, call or teardown) or during collection by using the allow_module_level flag. This function can be called in doctests as well.

Parameters

- **reason (str)** – The message to show the user as reason for the skip.
- **allow_module_level (bool)** – Allows this function to be called at module level. Raising the skip exception at module level will stop the execution of the module and prevent the collection of all tests in the module, even those defined before the skip call.

Defaults to False.

Raises

`pytest.skip.Exception` – The exception that is raised.

**Note:** It is better to use the `pytest.mark.skipif` marker when possible to declare a test to be skipped under certain conditions like mismatching platforms or dependencies. Similarly, use the `# doctest: +SKIP` directive (see doctest.SKIP) to skip a doctest statically.

**class pytest.skip.Exception**

The exception raised by `pytest.skip()`.

**pytest.importorskip**

`importorskip(modname, minversion=None, reason=None, *, exc_type=None)`

Import and return the requested module `modname`, or skip the current test if the module cannot be imported.

Parameters

- **modname (str)** – The name of the module to import.
- **minversion (str | None)** – If given, the imported module's `__version__` attribute must be at least this minimal version, otherwise the test is still skipped.
- **reason (str | None)** – If given, this reason is shown as the message when the module cannot be imported.
- **exc_type (type[ImportError] | None)** – The exception that should be captured in order to skip modules. Must be `ImportError` or a subclass.

If the module can be imported but raises `ImportError`, pytest will issue a warning to the user, as often users expect the module not to be found (which would raise `ModuleNotFoundError` instead).

This warning can be suppressed by passing `exc_type=ImportError` explicitly.

See `pytest.importorskip default behavior regarding ImportError` for details.

Returns

The imported module. This should be assigned to its canonical name.

Raises

`pytest.skip.Exception` – If the module cannot be imported.
Return type

*Any*

Example:

docutils = pytest.importorskip("docutils")

Added in version 8.2: The `exc_type` parameter.

**pytest.xfail**

`xfail()`

Imperatively xfail an executing test or setup function with the given reason.

This function should be called only during testing (setup, call or teardown).

No other code is executed after using `xfail()` (it is implemented internally by raising an exception).

**Parameters**

- `reason` *(str)* – The message to show the user as reason for the xfail.

**Note:** It is better to use the `pytest.mark.xfail` marker when possible to declare a test to be xfailed under certain conditions like known bugs or missing features.

**Raises**

`pytest.xfail.Exception` – The exception that is raised.

**class pytest.xfail.Exception**

The exception raised by `pytest.xfail()`.

**pytest.exit**

`exit()`

Exit testing process.

**Parameters**

- `reason` *(str)* – The message to show as the reason for exiting pytest. reason has a default value only because `msg` is deprecated.

- `returncode` *(int | None)* – Return code to be used when exiting pytest. None means the same as 0 (no error), same as `sys.exit()`.

**Raises**

`pytest.exit.Exception` – The exception that is raised.

**class pytest.exit.Exception**

The exception raised by `pytest.exit()`.
pytest Documentation, Release 8.3

pytest.main

**Tutorial:** Calling pytest from Python code

`main(args=None, plugins=None)`

Perform an in-process test run.

**Parameters**

- `args` *(list[str] | PathLike[str] | None)* – List of command line arguments. If None or not given, defaults to reading arguments directly from the process command line (sys.argv).

- `plugins` *(Sequence[str | object] | None)* – List of plugin objects to be auto-registered during initialization.

**Returns**

An exit code.

**Return type**

`int` | `ExitCode`

pytest.param

`param(*values[, id][, marks])`

Specify a parameter in `pytest.mark.parametrize` calls or parametrized fixtures.

```python
@pytest.mark.parametrize(
    "test_input,expected",
    [  
        ("3+5", 8),
        pytest.param("6*9", 42, marks=pytest.mark.xfail),
    ],
)
def test_eval(test_input, expected):
    assert eval(test_input) == expected
```

**Parameters**

- `values` *(object)* – Variable args of the values of the parameter set, in order.

- `marks` *(MarkDecorator | Collection[MarkDecorator | Mark])* – A single mark or a list of marks to be applied to this parameter set.

- `id` *(str | None)* – The id to attribute to this parameter set.

pytest.raises

**Tutorial:** Assertions about expected exceptions

```python
with raises(expected_exception: type[E] | tuple[type[E], ...], *, match: str | Pattern[str] | None = ...) →

RaisesContext[E] as excinfo
```

```python
with raises(expected_exception: type[E] | tuple[type[E], ...], func: Callable[...], Any], *args: Any, **kwargs:

Any) → ExceptionInfo[E] as excinfo
```

Assert that a code block/function call raises an exception type, or one of its subclasses.

**Parameters**
• **expected_exception** – The expected exception type, or a tuple if one of multiple possible exception types are expected. Note that subclasses of the passed exceptions will also match.

• **match** (str | re.Pattern[str] | None) – If specified, a string containing a regular expression, or a regular expression object, that is tested against the string representation of the exception and its PEP 678 __notes__ using re.search().

To match a literal string that may contain special characters, the pattern can first be escaped with re.escape().

(This is only used when pytest.raises is used as a context manager, and passed through to the function otherwise. When using pytest.raises as a function, you can use:

```python
pytest.raises(Exc, func, match="pattern").match("my pattern")
```

Use pytest.raises as a context manager, which will capture the exception of the given type, or any of its subclasses:

```python
>>> import pytest
>>> with pytest.raises(ZeroDivisionError):
...     1/0
```

If the code block does not raise the expected exception (ZeroDivisionError in the example above), or no exception at all, the check will fail instead.

You can also use the keyword argument match to assert that the exception matches a text or regex:

```python
>>> with pytest.raises(ValueError, match='must be 0 or None'):
...     raise ValueError("value must be 0 or None")
```

The match argument searches the formatted exception string, which includes any PEP-678 __notes__:

```python
>>> with pytest.raises(ValueError, match=r'had a note added'):
...     e = ValueError("value must be 42")
...     e.add_note("had a note added")
...     raise e
```

The context manager produces an ExceptionInfo object which can be used to inspect the details of the captured exception:

```python
>>> with pytest.raises(ValueError) as exc_info:
...     raise ValueError("value must be 42")
>>> assert exc_info.type is ValueError
>>> assert exc_info.value.args[0] == "value must be 42"
```

**Warning**: Given that pytest.raises matches subclasses, be wary of using it to match Exception like this:

```python
with pytest.raises(Exception):  # Careful, this will catch ANY exception raised.
    some_function()
```

Because Exception is the base class of almost all exceptions, it is easy for this to hide real bugs, where the user wrote this expecting a specific exception, but some other exception is being raised due to a bug introduced
Avoid using `pytest.raises` to catch `Exception` unless certain that you really want to catch any exception raised.

**Note:** When using `pytest.raises` as a context manager, it's worthwhile to note that normal context manager rules apply and that the exception raised must be the final line in the scope of the context manager. Lines of code after that, within the scope of the context manager will not be executed. For example:

```python
>>> value = 15
>>> with pytest.raises(ValueError) as exc_info:
...     if value > 10:
...         raise ValueError("value must be <= 10")
...     assert exc_info.type is ValueError  # This will not execute.
```

Instead, the following approach must be taken (note the difference in scope):

```python
>>> with pytest.raises(ValueError) as exc_info:
...     if value > 10:
...         raise ValueError("value must be <= 10")
...
>>> assert exc_info.type is ValueError
```

**Using with** `pytest.mark.parametrize`  
When using `pytest.mark.parametrize` it is possible to parametrize tests such that some runs raise an exception and others do not.

See [Parametrizing conditional raising](#parametrizing-conditional-raising) for an example.

**See also:**  
[Assertions about expected exceptions](#assertions-about-expected-exceptions) for more examples and detailed discussion.

**Legacy form**  
It is possible to specify a callable by passing a to-be-called lambda:

```python
>>> raises(ZeroDivisionError, lambda: 1/0)
<ExceptionInfo ...>
```

or you can specify an arbitrary callable with arguments:

```python
>>> def f(x): return 1/x
... >>> raises(ZeroDivisionError, f, 0)
<ExceptionInfo ...>
>>> raises(ZeroDivisionError, f, x=0)
<ExceptionInfo ...>
```

The form above is fully supported but discouraged for new code because the context manager form is regarded as more readable and less error-prone.

**Note:** Similar to caught exception objects in Python, explicitly clearing local references to returned `ExceptionInfo` objects can help the Python interpreter speed up its garbage collection.
Clearing those references breaks a reference cycle (ExceptionInfo -> caught exception -> frame stack raising the exception -> current frame stack -> local variables -> ExceptionInfo) which makes Python keep all objects referenced from that cycle (including all local variables in the current frame) alive until the next cyclic garbage collection run. More detailed information can be found in the official Python documentation for the try statement.

pytest.deprecated_call

Tutorial: Ensuring code triggers a deprecation warning

```python
with deprecated_call(*, match: str | Pattern[str] | None = ...) -> WarningsRecorder

with deprecated_call(func: Callable[..., T], *args: Any, **kwargs: Any) -> T
```

Assert that code produces a DeprecationWarning or PendingDeprecationWarning or FutureWarning.

This function can be used as a context manager:

```python
>>> import warnings
>>> def api_call_v2():
...     warnings.warn('use v3 of this api', DeprecationWarning)
...     return 200

>>> import pytest
>>> with pytest.deprecated_call():
...     assert api_call_v2() == 200
```

It can also be used by passing a function and `*args` and `**kwargs`, in which case it will ensure calling `func(*args, **kwargs)` produces one of the warnings types above. The return value is the return value of the function.

In the context manager form you may use the keyword argument `match` to assert that the warning matches a text or regex.

The context manager produces a list of `warnings.WarningMessage` objects, one for each warning raised.

pytest.register_assert_rewrite

Tutorial: Assertion Rewriting

```python
register_assert_rewrite(*names)
```

Register one or more module names to be rewritten on import.

This function will make sure that this module or all modules inside the package will get their assert statements rewritten. Thus you should make sure to call this before the module is actually imported, usually in your `__init__.py` if you are a plugin using a package.

**Parameters**

- `names (str)`: The module names to register.
**pytest.warns**

**Tutorial:** Asserting warnings with the warns function

```python
```

```
with warns(expected_warning: type[Warning] | tuple[type[Warning], ...], func: Callable[..., T], *args: Any, **kwargs: Any) → T
```

Assert that code raises a particular class of warning.

Specifically, the parameter `expected_warning` can be a warning class or tuple of warning classes, and the code inside the `with` block must issue at least one warning of that class or classes.

This helper produces a list of `warnings.WarningMessage` objects, one for each warning emitted (regardless of whether it is an `expected_warning` or not). Since pytest 8.0, unmatched warnings are also re-emitted when the context closes.

This function can be used as a context manager:

```python
>>> import pytest
>>> with pytest.warns(RuntimeWarning):
...     warnings.warn("my warning", RuntimeWarning)
```

In the context manager form you may use the keyword argument `match` to assert that the warning matches a text or regex:

```python
>>> with pytest.warns(UserWarning, match='must be 0 or None'):  
...     warnings.warn("value must be 0 or None", UserWarning)
```

```python
>>> with pytest.warns(UserWarning, match=r'must be \d+$'):  
...     warnings.warn("value must be 42", UserWarning)
```

```python
...     with pytest.warns(UserWarning, match=r'must be \d+$'):  
...         warnings.warn("this is not here", UserWarning)
Traceback (most recent call last):
...     Failed: DID NOT WARN. No warnings of type ...UserWarning... were emitted...
```

**Using with pytest.mark.parametrize**

When using `pytest.mark.parametrize` it is possible to parametrize tests such that some runs raise a warning and others do not.

This could be achieved in the same way as with exceptions, see *Parametrizing conditional raising* for an example.

**pytest.freeze.includes**

**Tutorial:** Freezing pytest

```python
freeze.includes()  
```

Return a list of module names used by pytest that should be included by `cx_freeze`. 

---

3.4. API Reference 255
3.4.3 Marks

Marks can be used to apply metadata to test functions (but not fixtures), which can then be accessed by fixtures or plugins.

pytest.mark.filterwarnings

Tutorial: @pytest.mark.filterwarnings
Add warning filters to marked test items.

```python
@_pytest.mark.filterwarnings("ignore:.*usage will be deprecated.→*:DeprecationWarning")
def test_foo(): ...
```

pytest.mark.parametrize

Tutorial: How to parametrize fixtures and test functions
This mark has the same signature as pytest.Metafunc.parametrize(); see there.

pytest.mark.skip

Tutorial: Skipping test functions
Unconditionally skip a test function.

```python
@_pytest.mark.skip(reason=None)
def test_foo(): ...
```

pytest.mark.skipif

Tutorial: Skipping test functions
Skip a test function if a condition is True.

```python
@_pytest.mark.skipif(condition, *, reason=None)
def test_foo(): ...
```
pytest.mark.usefixtures

**Tutorial:** *Use fixtures in classes and modules with usefixtures*

Mark a test function as using the given fixture names.

```python
pytest.mark.usefixtures(*names)
```

**Parameters**

- **args** – The names of the fixture to use, as strings.

**Note:** When using `usefixtures` in hooks, it can only load fixtures when applied to a test function before test setup (for example in the `pytest_collection_modifyitems` hook).

Also note that this mark has no effect when applied to `fixtures`.

pytest.mark.xfail

**Tutorial:** *XFail: mark test functions as expected to fail*

Marks a test function as *expected to fail*.

```python
pytest.mark.xfail(condition=False, *, reason=None, raises=None, run=True, strict=xfail_strict)
```

**Parameters**

- **condition** *(Union[bool, str]*) – Condition for marking the test function as xfail (True/False or a *condition string*). If a bool, you also have to specify `reason` (see *condition string*).

- **reason** *(str)* – Reason why the test function is marked as xfail.

- **raises** *(Type[Exception]*) – Exception class (or tuple of classes) expected to be raised by the test function; other exceptions will fail the test. Note that subclasses of the classes passed will also result in a match (similar to how the `except` statement works).

- **run** *(bool)* – Whether the test function should actually be executed. If False, the function will always xfail and will not be executed (useful if a function is segfaulting).

- **strict** *(bool)* –
  - If False the function will be shown in the terminal output as xfailed if it fails and as xpass if it passes. In both cases this will not cause the test suite to fail as a whole. This is particularly useful to mark `flaky` tests (tests that fail at random) to be tackled later.
  - If True, the function will be shown in the terminal output as xfailed if it fails, but if it unexpectedly passes then it will fail the test suite. This is particularly useful to mark functions that are always failing and there should be a clear indication if they unexpectedly start to pass (for example a new release of a library fixes a known bug).

Defaults to `xfail_strict`, which is False by default.
Custom marks

Marks are created dynamically using the factory object `pytest.mark` and applied as a decorator.

For example:

```python
@ pytest.mark.timeout(10, "slow", method="thread")
def test_function(): ...
```

Will create and attach a `Mark` object to the collected `Item`, which can then be accessed by fixtures or hooks with `Node.iter_markers`. The `mark` object will have the following attributes:

```python
mark.args == (10, "slow")
mark.kwargs == {"method": "thread"}
```

Example for using multiple custom markers:

```python
@ pytest.mark.timeout(10, "slow", method="thread")
@ pytest.mark.slow
def test_function(): ...
```

When `Node.iter_markers` or `Node.iter_markers_with_node` is used with multiple markers, the marker closest to the function will be iterated over first. The above example will result in `@pytest.mark.slow` followed by `@pytest.mark.timeout(...)`.

### 3.4.4 Fixtures

**Tutorial:** *Fixtures reference*

Fixtures are requested by test functions or other fixtures by declaring them as argument names.

Example of a test requiring a fixture:

```python
def test_output(capsys):
    print("hello")
    out, err = capsys.readouterr()
    assert out == "hello
```

Example of a fixture requiring another fixture:

```python
@ pytest.fixture
def db_session(tmp_path):
    fn = tmp_path / "db.file"
    return connect(fn)
```

For more details, consult the full *fixtures docs*. 
@pytest.fixture

@fixture (fixture_function: FixtureFunction, *, scope: Literal['session', 'package', 'module', 'class', 'function'] | Callable[[str, Config], Literal['session', 'package', 'module', 'class', 'function']] = 'function', params: Iterable[object] | None = None, autouse: bool = False, ids: Sequence[object | None] | Callable[[Any], object | None] | None = None, name: str | None = None) → FixtureFunction

@fixture (fixture_function: None = None, *, scope: Literal['session', 'package', 'module', 'class', 'function'] | Callable[[str, Config], Literal['session', 'package', 'module', 'class', 'function']] = 'function', params: Iterable[object] | None = None, autouse: bool = False, ids: Sequence[object | None] | Callable[[Any], object | None] | None = None, name: str | None = None) → FixtureFunctionMarker

Decorator to mark a fixture factory function.

This decorator can be used, with or without parameters, to define a fixture function.

The name of the fixture function can later be referenced to cause its invocation ahead of running tests: test modules or classes can use the `pytest.mark.usefixtures(fixturename)` marker.

Test functions can directly use fixture names as input arguments in which case the fixture instance returned from the fixture function will be injected.

Fixtures can provide their values to test functions using `return` or `yield` statements. When using `yield` the code block after the `yield` statement is executed as teardown code regardless of the test outcome, and must yield exactly once.

**Parameters**

- **scope** – The scope for which this fixture is shared; one of "function" (default), "class", "module", "package" or "session".
  
  This parameter may also be a callable which receives `(fixture_name, config)` as parameters, and must return a `str` with one of the values mentioned above.

  See Dynamic scope in the docs for more information.

- **params** – An optional list of parameters which will cause multiple invocations of the fixture function and all of the tests using it. The current parameter is available in `request.param`.

- **autouse** – If True, the fixture func is activated for all tests that can see it. If False (the default), an explicit reference is needed to activate the fixture.

- **ids** – Sequence of ids each corresponding to the params so that they are part of the test id. If no ids are provided they will be generated automatically from the params.

- **name** – The name of the fixture. This defaults to the name of the decorated function. If a fixture is used in the same module in which it is defined, the function name of the fixture will be shadowed by the function arg that requests the fixture; one way to resolve this is to name the decorated function `fixture_<fixturename>` and then use `@pytest.fixture`.

   ```python
   fixture(name='<fixturename>')
   ```
capfd

**Tutorial: How to capture stdout/stderr output**

capfd()

Enable text capturing of writes to file descriptors 1 and 2.

The captured output is made available via capfd.readouterr() method calls, which return a (out, err) namedtuple. out and err will be text objects.

Returns an instance of `CaptureFixture[str]`.

Example:

```python
def test_system_echo(capfd):
    os.system('echo "hello"
    captured = capfd.readouterr()
    assert captured.out == "hello
```

capfdbinary

**Tutorial: How to capture stdout/stderr output**

capfdbinary()

Enable bytes capturing of writes to file descriptors 1 and 2.

The captured output is made available via capfd.readouterr() method calls, which return a (out, err) namedtuple. out and err will be byte objects.

Returns an instance of `CaptureFixture[bytes]`.

Example:

```python
def test_system_echo(capfdbinary):
    os.system('echo "hello"
    captured = capfdbinary.readouterr()
    assert captured.out == b"hello
```

caplog

**Tutorial: How to manage logging**

caplog()

Access and control log capturing.

Captured logs are available through the following properties/methods:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caplog.messages</td>
<td>list of format-interpolated log messages</td>
</tr>
<tr>
<td>caplog.text</td>
<td>string containing formatted log output</td>
</tr>
<tr>
<td>caplog.records</td>
<td>list of logging.LogRecord instances</td>
</tr>
<tr>
<td>caplog.record_tuples</td>
<td>list of (logger_name, level, message) tuples</td>
</tr>
<tr>
<td>caplog.clear()</td>
<td>clear captured records and formatted log output string</td>
</tr>
</tbody>
</table>

260 Chapter 3. Reference guides
Returns a `pytest.LogCaptureFixture` instance.

**final class LogCaptureFixture**

Provides access and control of log capturing.

**property handler:** `LogCaptureHandler`

Get the logging handler used by the fixture.

**get_records**(when)

Get the logging records for one of the possible test phases.

**Parameters**

when (Literal['setup', 'call', 'teardown']) – Which test phase to obtain the records from. Valid values are: “setup”, “call” and “teardown”.

**Returns**

The list of captured records at the given stage.

**Return type**

list[LogRecord]

Added in version 3.4.

**property text:** `str`

The formatted log text.

**property records:** `list[LogRecord]`

The list of log records.

**property record_tuples:** `list[tuple[str, int, str]]`

A list of a stripped down version of log records intended for use in assertion comparison.

The format of the tuple is:

(logger_name, log_level, message)

**property messages:** `list[str]`

A list of format-interpolated log messages.

Unlike ‘records’, which contains the format string and parameters for interpolation, log messages in this list are all interpolated.

Unlike ‘text’, which contains the output from the handler, log messages in this list are unadorned with levels, timestamps, etc, making exact comparisons more reliable.

Note that traceback or stack info (from `logging.exception()` or the exc_info or stack_info arguments to the logging functions) is not included, as this is added by the formatter in the handler.

**clear()**

Reset the list of log records and the captured log text.

**set_level**(level, logger=None)

Set the threshold level of a logger for the duration of a test.

Logging messages which are less severe than this level will not be captured.
Changed in version 3.4: The levels of the loggers changed by this function will be restored to their initial values at the end of the test.

Will enable the requested logging level if it was disabled via `logging.disable()`.

**Parameters**

- `level (int | str)` - The level.
- `logger (str | None)` - The logger to update. If not given, the root logger.

**with at_level** *(level, logger=None)*

Context manager that sets the level for capturing of logs. After the end of the ‘with’ statement the level is restored to its original value.

Will enable the requested logging level if it was disabled via `logging.disable()`.

**Parameters**

- `level (int | str)` - The level.
- `logger (str | None)` - The logger to update. If not given, the root logger.

**with filtering** *(filter_)*

Context manager that temporarily adds the given filter to the caplog's `handler()` for the ‘with’ statement block, and removes that filter at the end of the block.

**Parameters**

- `filter` - A custom `logging.Filter` object.

Added in version 7.5.

capsys

**Tutorial: How to capture stdout/stderr output**

capsys()

Enable text capturing of writes to `sys.stdout` and `sys.stderr`.

The captured output is made available via `capsys.readouterr()` method calls, which return a `(out, err)` namedtuple. `out` and `err` will be `text` objects.

Returns an instance of `CaptureFixture[str]`.

Example:

```python
def test_output(capsys):
    print("hello")
captured = capsys.readouterr()
assert captured.out == "hello\n"
```

class CaptureFixture

Object returned by the `capsys, capsysbinary, capfd` and `capfdbinary` fixtures.
readouterr()

Read and return the captured output so far, resetting the internal buffer.

Returns
The captured content as a named tuple with `out` and `err` string attributes.

Return type
"CaptureResult"

with disabled()

Temporarily disable capturing while inside the `with` block.

capsysbinary

Tutorial: How to capture stdout/stderr output
capsysbinary()

Enable bytes capturing of writes to `sys.stdout` and `sys.stderr`.

The captured output is made available via `capsysbinary.readouterr()` method calls, which return a `(out, err)` named tuple. `out` and `err` will be bytes objects.

Returns an instance of `CaptureFixture[bytes]`.

Example:

```python
def test_output(capsysbinary):
    print("hello")
    captured = capsysbinary.readouterr()
    assert captured.out == b"hello\n"
```

config.cache

Tutorial: How to re-run failed tests and maintain state between test runs

The `config.cache` object allows other plugins and fixtures to store and retrieve values across test runs. To access it from fixtures request `pytestconfig` into your fixture and get it with `pytestconfig.cache`.

Under the hood, the cache plugin uses the simple `dumps/loads` API of the `json` stdlib module.

`config.cache` is an instance of `pytest.Cache`

- **final class Cache**

  Instance of the cache fixture.

  - **mkdir(name)**

    Return a directory path object with the given name.

    If the directory does not yet exist, it will be created. You can use it to manage files to e.g. store/retrieve database dumps across test sessions.

    Added in version 7.0.
Parameters

- **name (str)** – Must be a string not containing a / separator. Make sure the name contains your plugin or application identifiers to prevent clashes with other cache users.

**get (key, default)**

Return the cached value for the given key.

If no value was yet cached or the value cannot be read, the specified default is returned.

**Parameters**

- **key (str)** – Must be a / separated value. Usually the first name is the name of your plugin or your application.
- **default** – The value to return in case of a cache-miss or invalid cache value.

**set (key, value)**

Save value for the given key.

**Parameters**

- **key (str)** – Must be a / separated value. Usually the first name is the name of your plugin or your application.
- **value (object) – Must be of any combination of basic python types, including nested types like lists of dictionaries.

**doctest_namespace**

**Tutorial:** *How to run doctests*

**doctest_namespace ()**

Fixture that returns a dict that will be injected into the namespace of doctests.

Usually this fixture is used in conjunction with another autouse fixture:

```python
@pytest.fixture(autouse=True)
def add_np(doctest_namespace):
    doctest_namespace["np"] = numpy
```

For more details: *doctest_namespace' fixture.*

**monkeypatch**

**Tutorial:** *How to monkeypatch/mock modules and environments*

**monkeypatch ()**

A convenient fixture for monkey-patching.

The fixture provides these methods to modify objects, dictionaries, or os.environ:

- **monkeypatchsetattr(obj, name, value, raising=True)**
- **monkeypatchdelattr(obj, name, raising=True)**
- **monkeypatchsetitem(mapping, name, value)**
- **monkeypatchdelitem(obj, name, raising=True)**
- `monkeypatch.setenv(name, value, prepend=None)`
- `monkeypatch.delenv(name, raising=True)`
- `monkeypatch.syspath_prepend(path)`
- `monkeypatch.chdir(path)`
- `monkeypatch.context()`

All modifications will be undone after the requesting test function or fixture has finished. The `raising` parameter determines if a `KeyError` or `AttributeError` will be raised if the set/deletion operation does not have the specified target.

To undo modifications done by the fixture in a contained scope, use `context()`.

Returns a `MonkeyPatch` instance.

**final class MonkeyPatch**

Helper to conveniently monkeypatch attributes/items/environment variables/syspath.

Returned by the `monkeypatch` fixture.

Changed in version 6.2: Can now also be used directly as `pytest.MonkeyPatch()`, for when the fixture is not available. In this case, use `with MonkeyPatch.context() as mp:` or remember to call `undo()` explicitly.

**classmethod with context()**

Context manager that returns a new `MonkeyPatch` object which undoes any patching done inside the `with` block upon exit.

Example:

```python
import functools

def test_partial(monkeypatch):
    with monkeypatch.context() as m:
        m.setattr(functools, "partial", 3)
```

Useful in situations where it is desired to undo some patches before the test ends, such as mocking `stdlib` functions that might break pytest itself if mocked (for examples of this see #3290).

**setattr** *(target: str, name: object, value: ~_pytest.monkeypatch.Notset = <notset>, raising: bool = True) → None*

Set attribute value on target, memorizing the old value.

For example:

```python
import os

monkeypatch.setattr(os, "getcwd", lambda: "/")
```

The code above replaces the `os.getcwd()` function by a lambda which always returns "/".
For convenience, you can specify a string as `target` which will be interpreted as a dotted import path, with the last part being the attribute name:

```python
monkeypatch.setattr("os.getcwd", lambda: "/")
```

Raises `AttributeError` if the attribute does not exist, unless `raising` is set to False.

**Where to patch**

`monkeypatch.setattr` works by (temporarily) changing the object that a name points to with another one. There can be many names pointing to any individual object, so for patching to work you must ensure that you patch the name used by the system under test.

See the section Where to patch in the `unittest.mock` docs for a complete explanation, which is meant for `unittest.mock.patch()` but applies to `monkeypatch.setattr` as well.

**`delattr`**

```python
delattr(target, name=<notset>, raising=True)
```

Delete attribute `name` from `target`.

If no `name` is specified and `target` is a string it will be interpreted as a dotted import path with the last part being the attribute name.

Raises `AttributeError` if the attribute does not exist, unless `raising` is set to False.

**`setitem`**

```python
setitem(dic, name, value)
```

Set dictionary entry `name` to `value`.

**`delitem`**

```python
delitem(dic, name, raising=True)
```

Delete `name` from dict.

Raises `KeyError` if it doesn’t exist, unless `raising` is set to False.

**`setenv`**

```python
setenv(name, value, prepend=None)
```

Set environment variable `name` to `value`.

If `prepend` is a character, read the current environment variable value and prepend the `value` adjoined with the `prepend` character.

**`delenv`**

```python
delenv(name, raising=True)
```

Delete `name` from the environment.

Raises `KeyError` if it does not exist, unless `raising` is set to False.

**`syspath_prepend`**

```python
syspath_prepend(path)
```

Prepend `path` to `sys.path` list of import locations.

**`chdir`**

```python
chdir(path)
```

Change the current working directory to the specified path.

**Parameters**

- `path (str | PathLike[str])` – The path to change into.
**undo**

Undo previous changes.

This call consumes the undo stack. Calling it a second time has no effect unless you do more monkeypatching after the undo call.

There is generally no need to call `undo()`, since it is called automatically during tear-down.

---

**Note:** The same `monkeypatch` fixture is used across a single test function invocation. If `monkeypatch` is used both by the test function itself and one of the test fixtures, calling `undo()` will undo all of the changes made in both functions.

Prefer to use `context()` instead.

---

**pytestconfig**

**pytestconfig()**

Session-scoped fixture that returns the session’s `pytest.Config` object.

Example:

```python
def test_foo(pytestconfig):
    if pytestconfig.getoption("verbose") > 0:
        ...
```

**pytester**

Added in version 6.2.

Provides a `Pytester` instance that can be used to run and test pytest itself.

It provides an empty directory where pytest can be executed in isolation, and contains facilities to write tests, configuration files, and match against expected output.

To use it, include in your topmost `conftest.py` file:

```python
pytest_plugins = "pytester"
```

**final class Pytester**

Facilities to write tests/configuration files, execute pytest in isolation, and match against expected output, perfect for black-box testing of pytest plugins.

It attempts to isolate the test run from external factors as much as possible, modifying the current working directory to `path` and environment variables during initialization.

```python
exception TimeoutExpired
```
plugins: list[str | object]

A list of plugins to use with `parseconfig()` and `runpytest()`. Initially this is an empty list but plugins can be added to the list. The type of items to add to the list depends on the method using them so refer to them for details.

property path: Path

Temporary directory path used to create files/run tests from, etc.

make_hook_recorder (pluginmanager)

Create a new `HookRecorder` for a `PytestPluginManager`.

`chdir`()

Cd into the temporary directory.

This is done automatically upon instantiation.

makefile (ext, *args, **kwargs)

Create new text file(s) in the test directory.

Parameters

- **ext (str)** – The extension the file(s) should use, including the dot, e.g. `.py`.
- **args (str)** – All args are treated as strings and joined using newlines. The result is written as contents to the file. The name of the file is based on the test function requesting this fixture.
- **kwargs (str)** – Each keyword is the name of a file, while the value of it will be written as contents of the file.

Returns

The first created file.

Return type

Path

Examples:

```python
pytester.makefile(".txt", "line1", "line2")
pytester.makefile(".ini", pytest="[pytest]\n
addopts=-rs\n")
```

To create binary files, use `pathlib.Path.write_bytes()` directly:

```python
filename = pytester.path.joinpath("foo.bin")
filename.write_bytes(b"...")
```

makeconftest (source)

Write a conftest.py file.

Parameters

- **source (str)** – The contents.

Returns

The conftest.py file.

Return type

Path
makeini *(source)*
Write a tox.ini file.

Parameters

source *(str)* – The contents.

Returns

The tox.ini file.

Return type

Path

getinicfg *(source)*
Return the pytest section from the tox.ini config file.

makepyprojecttoml *(source)*
Write a pyproject.toml file.

Parameters

source *(str)* – The contents.

Returns

The pyproject.ini file.

Return type

Path

Added in version 6.0.

makepyfile *(args, **kwargs)*
Shortcut for .makefile() with a .py extension.

Defaults to the test name with a `.py` extension, e.g testfoobar.py, overwriting existing files.

Examples:

```python
def test_something(pytester):
    # Initial file is created test_something.py.
    pytester.makepyfile("foobar")
    # To create multiple files, pass kwargs accordingly.
    pytester.makepyfile(custom="foobar")
    # At this point, both 'test_something.py' & 'custom.py' exist in the test_directory.
```

maketxtfile *(args, **kwargs)*
Shortcut for .makefile() with a .txt extension.

Defaults to the test name with a `.txt` extension, e.g testfoobar.txt, overwriting existing files.

Examples:

```python
def test_something(pytester):
    # Initial file is created test_something.txt.
    pytester.maketxtfile("foobar")
    # To create multiple files, pass kwargs accordingly.
    pytester.maketxtfile(custom="foobar")
```

(continues on next page)
syspathinsert (path=None)

Prepend a directory to sys.path, defaults to path.

This is undone automatically when this object dies at the end of each test.

Parameters

path (str | PathLike[str] | None) – The path.

mkdir (name)

Create a new (sub)directory.

Parameters

name (str | PathLike[str]) – The name of the directory, relative to the pytester path.

Returns

The created directory.

Return type

pathlib.Path

mkpydir (name)

Create a new python package.

This creates a (sub)directory with an empty __init__.py file so it gets recognised as a Python package.

copy_example (name=None)

Copy file from project's directory into the testdir.

Parameters

name (str | None) – The name of the file to copy.

Returns

Path to the copied directory (inside self.path).

Return type

pathlib.Path

getnode (config, arg)

Get the collection node of a file.

Parameters

- config (Config) – A pytest config. See parseconfig() and parseconfig-ure() for creating it.
- arg (str | PathLike[str]) – Path to the file.

Returns

The node.

Return type

Collector | Item
getpathnode (path)
Return the collection node of a file.
This is like getnode() but uses parseconfigure() to create the (configured) pytest Config instance.

Parameters
path (str | PathLike[str]) – Path to the file.

Returns
The node.

Return type
Collector | Item
genitems (colitems)
Generate all test items from a collection node.
This recurses into the collection node and returns a list of all the test items contained within.

Parameters
colitems (Sequence[Item | Collector]) – The collection nodes.

Returns
The collected items.

Return type
list[Item]
runitem (source)
Run the “test_func” Item.
The calling test instance (class containing the test method) must provide a .getrunner() method which should return a runner which can run the test protocol for a single item, e.g. _pytest.runner.runtestprotocol.

inline_runsource (source, *cmdlineargs)
Run a test module in process using pytest.main().
This run writes “source” into a temporary file and runs pytest.main() on it, returning a HookRecorder instance for the result.

Parameters
- source (str) – The source code of the test module.
- cmdlineargs – Any extra command line arguments to use.

inline_genitems (*args)
Run pytest.main(['--collect-only']) in-process.
Runs the pytest.main() function to run all of pytest inside the test process itself like inline_run(), but returns a tuple of the collected items and a HookRecorder instance.

inline_run (*args, plugins=(), no_reraise_ctrlc=False)
Run pytest.main() in-process, returning a HookRecorder.
Runs the pytest.main() function to run all of pytest inside the test process itself. This means it can return a HookRecorder instance which gives more detailed results from that run than can be done by matching stdout/stderr from runpytest().
Parameters

- **args** *(str | PathLike[str]) – Command line arguments to pass to pytest. main().)*
- **plugins** – Extra plugin instances the pytest.main() instance should use.
- **no_reraise_ctrlc**(bool) – Typically we reraise keyboard interrupts from the child run. If True, the KeyboardInterrupt exception is captured.

**runpytest_inprocess**(*args, **kwargs)

Return result of running pytest in-process, providing a similar interface to what self.runpytest() provides.

**runpytest**(*args, **kwargs)

Run pytest inline or in a subprocess, depending on the command line option “–runpytest” and return a RunResult.

**parseconfig**(*args)

Return a new pytest pytest.Config instance from given commandline args.

This invokes the pytest bootstrapping code in _pytest.config to create a new pytest. PytestPluginManager and call the pytest_cmdline_parse hook to create a new pytest. Config instance.

If plugins has been populated they should be plugin modules to be registered with the plugin manager.

**parseconfigure**(*args)

Return a new pytest configured Config instance.

Returns a new pytest.Config instance like parseconfig(), but also calls the pytest_configure hook.

**getitem***(source, funcname='test_func')

Return the test item for a test function.

Writes the source to a python file and runs pytest's collection on the resulting module, returning the test item for the requested function name.

Parameters

- **source** *(str | PathLike[str]) – The module source.)*
- **funcname** *(str) – The name of the test function for which to return a test item.)*

Returns

The test item.

Return type

Item

**getitems***(source)

Return all test items collected from the module.

Writes the source to a Python file and runs pytest's collection on the resulting module, returning all test items contained within.
getmodulecol (source, configargs=(), *, withinit=False)

Return the module collection node for source.
Writes source to a file using makepyfile() and then runs the pytest collection on it, returning the collection node for the test module.

Parameters
- source (str | PathLike[str]) – The source code of the module to collect.
- configargs – Any extra arguments to pass to parseconfigure().
- withinit (bool) – Whether to also write an __init__.py file to the same directory to ensure it is a package.

collect_by_name (modcol, name)

Return the collection node for name from the module collection.
Searches a module collection node for a collection node matching the given name.

Parameters
- modcol (Collector) – A module collection node; see getmodulecol().
- name (str) – The name of the node to return.

popen (cmdargs, stdout=-1, stderr=-1, stdin=NotSetType.token, **kw)

Invoke subprocess.Popen.
Calls subprocess.Popen making sure the current working directory is in PYTHONPATH.
You probably want to use run() instead.

run (*cmdargs, timeout=None, stdin=NotSetType.token)

Run a command with arguments.
Run a process using subprocess.Popen saving the stdout and stderr.

Parameters
- cmdargs (str | PathLike[str]) – The sequence of arguments to pass to subprocess.Popen, with path-like objects being converted to str automatically.
- timeout (float | None) – The period in seconds after which to timeout and raise Pytester.TimeoutExpired.
- stdin (pytest.compat.NotSetType | bytes | IO[Any] | int) – Optional standard input.
  - If it is CLOSE_STDIN (Default), then this method calls subprocess.Popen with stdin=subprocess.PIPE, and the standard input is closed immediately after the new command is started.
  - If it is of type bytes, these bytes are sent to the standard input of the command.
  - Otherwise, it is passed through to subprocess.Popen. For further information in this case, consult the document of the stdin parameter in subprocess.Popen.

Returns
The result.

Return type
RunResult
runpython (script)
Run a python script using sys.executable as interpreter.

runpython_c (command)
Run python -c "command".

runpytest_subprocess (*args, timeout=None)
Run pytest as a subprocess with given arguments.

Any plugins added to the plugins list will be added using the -p command line option. Additionally --basetemp is used to put any temporary files and directories in a numbered directory prefixed with "runpytest-" to not conflict with the normal numbered pytest location for temporary files and directories.

Parameters
- **args** (str | PathLike[str]) – The sequence of arguments to pass to the pytest subprocess.
- **timeout** (float | None) – The period in seconds after which to timeout and raise pytester.TimeoutExpired.

Returns
The result.

Return type
RunResult

spawn_pytest (string, expect_timeout=10.0)
Run pytest using pexpect.
This makes sure to use the right pytest and sets up the temporary directory locations.
The pexpect child is returned.

spawn (cmd, expect_timeout=10.0)
Run a command using pexpect.
The pexpect child is returned.

final class RunResult
The result of running a command from Pytester.

ret: int | ExitCode
The return value.

outlines
List of lines captured from stdout.

errlines
List of lines captured from stderr.
```

stdout

LineMatcher of stdout.

Use e.g. \texttt{str(stdout)} to reconstruct stdout, or the commonly used \texttt{stdout.fnmatch_lines()} method.

stderr

LineMatcher of stderr.

duration

Duration in seconds.

\texttt{parseoutcomes()} 

Return a dictionary of outcome noun -> count from parsing the terminal output that the test process produced.

The returned nouns will always be in plural form:

\begin{verbatim}
======== 1 failed, 1 passed, 1 warning, 1 error in 0.13s ====
\end{verbatim}

Will return \{'failed": 1, "passed": 1, "warnings": 1, "errors": 1\}.

\texttt{classmethod parse_summary_nouns(lines)}

Extract the nouns from a pytest terminal summary line.

It always returns the plural noun for consistency:

\begin{verbatim}
======== 1 failed, 1 passed, 1 warning, 1 error in 0.13s ====
\end{verbatim}

Will return \{'failed": 1, "passed": 1, "warnings": 1, "errors": 1\}.

\texttt{assert_outcomes(passed=0, skipped=0, failed=0, errors=0, xpassed=0, xfailed=0, warnings=None, deselected=None)}

Assert that the specified outcomes appear with the respective numbers (0 means it didn't occur) in the text output from a test run.

\texttt{warnings} and \texttt{deselected} are only checked if not None.

\texttt{class LineMatcher}

Flexible matching of text.

This is a convenience class to test large texts like the output of commands.

The constructor takes a list of lines without their trailing newlines, i.e. \texttt{text.splitlines()}.

\texttt{__str__()} 

Return the entire original text.

Added in version 6.2: You can use \texttt{str()} in older versions.

\texttt{fnmatch_lines_random(lines2)}

Check lines exist in the output in any order (using \texttt{fnmatch.fnmatch()}).

```

3.4. API Reference 275
re_match_lines_random \([\text{lines2}]\)
Check lines exist in the output in any order (using \texttt{re.match()}).

get_lines_after \([\text{fnline}]\)
Return all lines following the given line in the text.
The given line can contain glob wildcards.

fnmatch_lines \([\text{lines2}, *, \text{consecutive}=\text{False}]\)
Check lines exist in the output (using \texttt{fnmatch.fnmatch()}).
The argument is a list of lines which have to match and can use glob wildcards. If they do not match a pytest.fail() is called. The matches and non-matches are also shown as part of the error message.

Parameters
- \text{lines2} (\texttt{Sequence[str]}) – String patterns to match.
- \text{consecutive} (\texttt{bool}) – Match lines consecutively?

re_match_lines \([\text{lines2}, *, \text{consecutive}=\text{False}]\)
Check lines exist in the output (using \texttt{re.match()}).
The argument is a list of lines which have to match using \texttt{re.match}. If they do not match a pytest.fail() is called.
The matches and non-matches are also shown as part of the error message.

Parameters
- \text{lines2} (\texttt{Sequence[str]}) – string patterns to match.
- \text{consecutive} (\texttt{bool}) – match lines consecutively?

no_fnmatch_line \([\text{pat}]\)
Ensure captured lines do not match the given pattern, using \texttt{fnmatch.fnmatch}.

Parameters
- \text{pat} (\texttt{str}) – The pattern to match lines.

no_re_match_line \([\text{pat}]\)
Ensure captured lines do not match the given pattern, using \texttt{re.match}.

Parameters
- \text{pat} (\texttt{str}) – The regular expression to match lines.

str()
Return the entire original text.

final class HookRecorder
Record all hooks called in a plugin manager.
Hook recorders are created by \texttt{Pytester}.
This wraps all the hook calls in the plugin manager, recording each call before propagating the normal calls.
getcalls *(names)*

Get all recorded calls to hooks with the given names (or name).

matchreport *(inamelpart='', names=('pytest_runtest_logreport', 'pytest_collectreport'), when=None)*

Return a testreport whose dotted import path matches.

**final class RecordedHookCall**

A recorded call to a hook.

The arguments to the hook call are set as attributes. For example:

```python
calls = hook_recorder.getcalls("pytest_runtest_setup")
# Suppose pytest_runtest_setup was called once with 'item=an_item'.
assert calls[0].item is an_item
```

**record_property**

**Tutorial:** record_property example

**record_property()**

Add extra properties to the calling test.

User properties become part of the test report and are available to the configured reporters, like JUnit XML.

The fixture is callable with *name*, *value*. The value is automatically XML-encoded.

Example:

```python
def test_function(record_property):
    record_property("example_key", 1)
```

**record_testsuite_property**

**Tutorial:** record_testsuite_property example

**record_testsuite_property()**

Record a new `<property>` tag as child of the root `<testsuite>`.

This is suitable to writing global information regarding the entire test suite, and is compatible with `xunit2` JUnit family.

This is a *session*-scoped fixture which is called with *(name, value)*. Example:

```python
def test_foo(record_testsuite_property):
    record_testsuite_property("ARCH", "PPC")
    record_testsuite_property("STORAGE_TYPE", "CEPH")
```

**Parameters**
• **name** – The property name.
• **value** – The property value. Will be converted to a string.

**Warning:** Currently this fixture **does not work** with the pytest-xdist plugin. See #7767 for details.

### recwarn

**Tutorial:** *Asserting warnings with the warns function*

**recwarn()**

Return a `WarningsRecorder` instance that records all warnings emitted by test functions.

See https://docs.pytest.org/en/latest/how-to/capture-warnings.html for information on warning categories.

#### class WarningsRecorder

A context manager to record raised warnings.

Each recorded warning is an instance of `warnings.WarningMessage`.

Adapted from `warnings.catch_warnings`.

**Note:** `DeprecationWarning` and `PendingDeprecationWarning` are treated differently; see *Ensuring code triggers a deprecation warning*.

**property list:** `list[WarningMessage]`

The list of recorded warnings.

**pop** (`cls=<class 'Warning'>`)

Pop the first recorded warning which is an instance of `cls`, but not an instance of a child class of any other match. Raises `AssertionError` if there is no match.

**clear()**

Clear the list of recorded warnings.

### request

**Example:** *Pass different values to a test function, depending on command line options*

The `request` fixture is a special fixture providing information of the requesting test function.

#### class FixtureRequest

The type of the `request` fixture.

A request object gives access to the requesting test context and has a `param` attribute in case the fixture is parametrized.
fixturename: Final
Fixture for which this request is being performed.

property scope: Literal['session', 'package', 'module', 'class', 'function']
Scope string, one of “function”, “class”, “module”, “package”, “session”.

property fixturenames: list[str]
Names of all active fixtures in this request.

abstract property node
Underlying collection node (depends on current request scope).

property config: Config
The pytest config object associated with this request.

property function
Test function object if the request has a per-function scope.

property cls
Class (can be None) where the test function was collected.

property instance
Instance (can be None) on which test function was collected.

property module
Python module object where the test function was collected.

property path: Path
Path where the test function was collected.

property keywords: MutableMapping[str, Any]
Keywords/markers dictionary for the underlying node.

property session: Session
Pytest session object.

abstractmethod addfinalizer(finalizer)
Add finalizer/teardown function to be called without arguments after the last test within the requesting test context finished execution.

applymarker(marker)
Apply a marker to a single test function invocation.
This method is useful if you don’t want to have a keyword/marker on all function invocations.

Parameters

marker (str | MarkDecorator) – An object created by a call to pytest.mark.
NAME(...).

raiseerror(msg)
Raise a FixtureLookupError exception.

Parameters

msg (str | None) – An optional custom error message.
**getfixturevalue** (*argname*)

Dynamically run a named fixture function.

Declaring fixtures via function argument is recommended where possible. But if you can only decide whether to use another fixture at test setup time, you may use this function to retrieve it inside a fixture or test function body.

This method can be used during the test setup phase or the test run phase, but during the test teardown phase a fixture’s value may not be available.

**Parameters**

*argname* *(str)* – The fixture name.

**Raises**

`pytest.FixtureLookupError` – If the given fixture could not be found.

**testdir**

Identical to *pytester*, but provides an instance whose methods return legacy *py.path.local* objects instead when applicable.

New code should avoid using *testdir* in favor of *pytester*.

**final class Testdir**

Similar to *Pytester*, but this class works with legacy *legacy_path* objects instead.

All methods just forward to an internal *Pytester* instance, converting results to *legacy_path* objects as necessary.

**exception TimeoutExpired**

**property tmpdir: LocalPath**

Temporary directory where tests are executed.

**make_hook_recorder** (*pluginmanager*)

See *Pytester.make_hook_recorder()*.

**chdir()**

See *Pytester.chdir()*.

**makefile** (*ext, *args, **kwargs*)

See *Pytester.makefile()*.

**makeconftest** (*source*)

See *Pytester.makeconftest()*.

**makeini** (*source*)

See *Pytester.makeini()*.
getinicfg \(\text{source}\)
See Pytester.getinicfg().

makepyprojecttoml \(\text{source}\)
See Pytester.makepyprojecttoml().

makepyfile \(*\text{args}, **\text{kwargs}\)
See Pytester.makepyfile().

maketxtfile \(*\text{args}, **\text{kwargs}\)
See Pytester.maketxtfile().

syspathinsert \(\text{path=}\text{\texttt{None}}\)
See Pytester.syspathinsert().

mkdir \(\text{name}\)
See Pytester.mkdir().

mkpydir \(\text{name}\)
See Pytester.mkpydir().

copy_example \(\text{name=}\text{\texttt{None}}\)
See Pytester.copy_example().

getnode \(\text{config, arg}\)
See Pytester.getnode().

getpathnode \(\text{path}\)
See Pytester.getpathnode().
genitems \(\text{colitems}\)
See Pytester.genitems().

runitem \(\text{source}\)
See Pytester.runitem().

inline_runsource \(\text{source, *\text{cmdlineargs}}\)
See Pytester.inline_runsource().

inline_genitems \(*\text{args}\)
See Pytester.inline_genitems().

3.4. API Reference 281
inline_run(*args, plugins=(), no_reraise_ctrlc=False)
    See Pytester.inline_run().

runpytest_inprocess(*args, **kwargs)
    See Pytester.runpytest_inprocess().

runpytest(*args, **kwargs)
    See Pytester.runpytest().

parseconfig(*args)
    See Pytester.parseconfig().

parseconfigure(*args)
    See Pytester.parseconfigure().

ggetitem(source, funcname='test_func')
    See Pytester.getitem().

getitems(source)
    See Pytester.getitems().

getmodulecol(source, configargs=(), withinit=False)
    See Pytester.getmodulecol().

collect_by_name(modcol, name)
    See Pytester.collect_by_name().

popen(cmdargs, stdout=-1, stderr=-1, stdin=NotSetType.token, **kw)
    See Pytester.popen().

run(*cmdargs, timeout=None, stdin=NotSetType.token)
    See Pytester.run().

runpython(script)
    See Pytester.runpython().

runpython_c(command)
    See Pytester.runpython_c().

runpytest_subprocess(*args, timeout=None)
    See Pytester.runpytest_subprocess().
spawn pytest (string, expect_timeout=10.0)

See Pytest.spawn pytest().

spawn (cmd, expect_timeout=10.0)

See Pytest.spawn().

tmp_path

Tutorial: How to use temporary directories and files in tests
tmp_path()

Return a temporary directory path object which is unique to each test function invocation, created as a sub directory of the base temporary directory.

By default, a new base temporary directory is created each test session, and old bases are removed after 3 sessions, to aid in debugging. This behavior can be configured with tmp_path_retention_count and tmp_path_retention_policy. If --basetemp is used then it is cleared each session. See Temporary directory location and retention.

The returned object is a pathlib.Path object.

tmp_path_factory

Tutorial: The tmp_path_factory fixture
tmp_path_factory is an instance of TempPathFactory:

final class TempPathFactory

Factory for temporary directories under the common base temp directory.

The base directory can be configured using the --basetemp option.

mktemp (basename, numbered=True)

Create a new temporary directory managed by the factory.

Parameters

• basename (str) – Directory base name, must be a relative path.

• numbered (bool) – If True, ensure the directory is unique by adding a numbered suffix greater than any existing one: basename="foo-" and numbered=True means that this function will create directories named "foo-0", "foo-1", "foo-2" and so on.

Returns

The path to the new directory.

Return type

Path
getbasetemp()

Return the base temporary directory, creating it if needed.

Returns
The base temporary directory.

Return type
Path

tmpdir

Tutorial: The tmpdir and tmpdir_factory fixtures
tmpdir()

Return a temporary directory path object which is unique to each test function invocation, created as a sub directory of the base temporary directory.

By default, a new base temporary directory is created each test session, and old bases are removed after 3 sessions, to aid in debugging. If --basetemp is used then it is cleared each session. See Temporary directory location and retention.

The returned object is a legacy_path object.

Note: These days, it is preferred to use tmp_path.

About the tmpdir and tmpdir_factory fixtures.

tmpdir_factory

Tutorial: The tmpdir and tmpdir_factory fixtures
tmpdir_factory is an instance of TempdirFactory:

final class TempdirFactory
Backward compatibility wrapper that implements py.path.local for TempPathFactory.

Note: These days, it is preferred to use tmp_path_factory.

About the tmpdir and tmpdir_factory fixtures.

mktemp (basename, numbered=True)

Same as TempPathFactory.mktemp(), but returns a py.path.local object.

getbasetemp()

Same as TempPathFactory.getbasetemp(), but returns a py.path.local object.
3.4.5 Hooks

Tutorial: Writing plugins
Reference to all hooks which can be implemented by conftest.py files and plugins.

@ pytest.hookimpl
@ pytest.hookimpl
pytest's decorator for marking functions as hook implementations.
See Writing hook functions and pluggy.HookimplMarker().

@ pytest.hookspec
@ pytest.hookspec
pytest's decorator for marking functions as hook specifications.
See Declaring new hooks and pluggy.HookspecMarker().

Bootstrapping hooks

Bootstrapping hooks called for plugins registered early enough (internal and third-party plugins).

pytest_load_initial_conftests (early_config, parser, args)
Called to implement the loading of initial conftest files ahead of command line option parsing.

Parameters
• early_config (Config) – The pytest config object.
• args (list[str]) – Arguments passed on the command line.
• parser (Parser) – To add command line options.

Use in conftest plugins

This hook is not called for conftest files.

pytest_cmdline_parse (pluginmanager, args)
Return an initialized Config, parsing the specified args.
Stops at first non-None result, see firstresult: stop at first non-None result.

Note: This hook is only called for plugin classes passed to the plugins arg when using pytest.main to perform an in-process test run.

Parameters
• pluginmanager (PytestPluginManager) – The pytest plugin manager.
• args (list[str]) – List of arguments passed on the command line.

Returns
A pytest config object.
Return type

`Config | None`

Use in conftest plugins

This hook is not called for conftest files.

`pytest_cmdline_main(config)`

Called for performing the main command line action.

The default implementation will invoke the configure hooks and `pytest_runtestloop`.

Stops at first non-None result, see `firstresult: stop at first non-None result`.

Parameters

- `config (Config)` – The pytest config object.

Returns

The exit code.

Return type

`ExitCode | int | None`

Use in conftest plugins

This hook is only called for initial conftests.

Initialization hooks

Initialization hooks called for plugins and `conftest.py` files.

`pytest_addoption(parser, pluginmanager)`

Register argparse-style options and ini-style config values, called once at the beginning of a test run.

Parameters

- `parser (Parser)` – To add command line options, call `parser.addoption(...).` To add ini-file values call `parser.addini(...).`
- `pluginmanager (PytestPluginManager)` – The pytest plugin manager, which can be used to install `hookspec()`’s or `hookimpl()`’s and allow one plugin to call another plugin’s hooks to change how command line options are added.

Options can later be accessed through the `config` object, respectively:

- `config.getoption(name)` to retrieve the value of a command line option.
- `config.getini(name)` to retrieve a value read from an ini-style file.

The config object is passed around on many internal objects via the `.config` attribute or can be retrieved as the `pytestconfig` fixture.

Note: This hook is incompatible with hook wrappers.
Use in conftest plugins

If a conftest plugin implements this hook, it will be called immediately when the conftest is registered.

This hook is only called for *initial conftests*.

**pytest_addhooks** *(pluginmanager)*

Called at plugin registration time to allow adding new hooks via a call to `pluginmanager.add_hookspecs(module_or_class, prefix)`.

Parameters

`pluginmanager` *(PytestPluginManager)* – The pytest plugin manager.

**Note:** This hook is incompatible with hook wrappers.

Use in conftest plugins

If a conftest plugin implements this hook, it will be called immediately when the conftest is registered.

**pytest_configure** *(config)*

Allow plugins and conftest files to perform initial configuration.

**Note:** This hook is incompatible with hook wrappers.

Parameters

`config` *(Config)* – The pytest config object.

Use in conftest plugins

This hook is called for every *initial conftest* file after command line options have been parsed. After that, the hook is called for other conftest files as they are registered.

**pytest_unconfigure** *(config)*

Called before test process is exited.

Parameters

`config` *(Config)* – The pytest config object.

Use in conftest plugins

Any conftest file can implement this hook.

**pytest_sessionstart** *(session)*

Called after the `Session` object has been created and before performing collection and entering the run test loop.

Parameters

`session` *(Session)* – The pytest session object.
Use in conftest plugins

This hook is only called for initial conftests.

pytest_sessionfinish(session, exitstatus)

Called after whole test run finished, right before returning the exit status to the system.

Parameters

- `session` (Session) – The pytest session object.
- `exitstatus` (int / ExitCode) – The status which pytest will return to the system.

Use in conftest plugins

Any conftest file can implement this hook.

pytest_plugin_registered(plugin, plugin_name, manager)

A new pytest plugin got registered.

Parameters

- `plugin` (_PluggyPlugin) – The plugin module or instance.
- `plugin_name` (str) – The name by which the plugin is registered.
- `manager` (PytestPluginManager) – The pytest plugin manager.

Note: This hook is incompatible with hook wrappers.

Use in conftest plugins

If a conftest plugin implements this hook, it will be called immediately when the conftest is registered, once for each plugin registered thus far (including itself!), and for all plugins thereafter when they are registered.

Collection hooks

pytest calls the following hooks for collecting files and directories:

pytest_collection(session)

Perform the collection phase for the given session.

Stops at first non-None result, see firstresult: stop at first non-None result. The return value is not used, but only stops further processing.

The default collection phase is this (see individual hooks for full details):

1. Starting from `session` as the initial collector:
   1. pytest_collectstart(collector)
   2. `report = pytest_make_collect_report(collector)`
   3. `pytest_exception_interact(collector, call, report)` if an interactive exception occurred
   4. For each collected node:
1. If an item, **pytest_itemcollected(item)**
2. If a collector, recurse into it.
5. **pytest_collectreport(report)**

2. **pytest_collection_modifyitems(session, config, items)**

1. **pytest_deselected(items)** for any deselected items (may be called multiple times)
3. **pytest_collection_finish(session)**
4. Set `session.items` to the list of collected items
5. Set `session.testscollected` to the number of collected items

You can implement this hook to only perform some action before collection, for example the terminal plugin uses it to start displaying the collection counter (and returns `None`).

**Parameters**

- **session (Session)** – The pytest session object.

**Use in conftest plugins**

This hook is only called for *initial conftests*.

**pytest_ignore_collect** *(collection_path, path, config)*

Return `True` to ignore this path for collection.

Return `None` to let other plugins ignore the path for collection.

Returning `False` will forcefully *not* ignore this path for collection, without giving a chance for other plugins to ignore this path.

This hook is consulted for all files and directories prior to calling more specific hooks.

*Stops at first non-None result, see* **firstresult: stop at first non-None result.**

**Parameters**

- **collection_path (pathlib.Path)** – The path to analyze.
- **path (LEGACY_PATH)** – The path to analyze (deprecated).
- **config (Config)** – The pytest config object.

*Changed in version 7.0.0: The collection_path parameter was added as a pathlib.Path equivalent of the path parameter. The path parameter has been deprecated.*

**Use in conftest plugins**

Any conftest file can implement this hook. For a given collection path, only conftest files in parent directories of the collection path are consulted (if the path is a directory, its own conftest file is *not* consulted - a directory cannot ignore itself!).
pytest_collect_directory(path, parent)
Create a Collector for the given directory, or None if not relevant.
Added in version 8.0.
For best results, the returned collector should be a subclass of Directory, but this is not required.
The new node needs to have the specified parent as a parent.
Stops at first non-None result, see firstresult: stop at first non-None result.

Parameters
path(pathlib.Path) – The path to analyze.
See Using a custom directory collector for a simple example of use of this hook.

Use in conftest plugins
Any conftest file can implement this hook. For a given collection path, only conftest files in parent directories of
the collection path are consulted (if the path is a directory, its own conftest file is not consulted - a directory cannot
collect itself!).

pytest_collect_file(file_path, path, parent)
Create a Collector for the given path, or None if not relevant.
For best results, the returned collector should be a subclass of File, but this is not required.
The new node needs to have the specified parent as a parent.

Parameters
- file_path(pathlib.Path) – The path to analyze.
- path(LEGACY_PATH) – The path to collect (deprecated).

Changed in version 7.0.0: The file_path parameter was added as a pathlib.Path equivalent of the path parameter. The path parameter has been deprecated.

Use in conftest plugins
Any conftest file can implement this hook. For a given file path, only conftest files in parent directories of the file
path are consulted.

pytest_pycollect_makemodule(module_path, path, parent)
Return a pytest.Module collector or None for the given path.
This hook will be called for each matching test module path. The pytest_collect_file hook needs to be
used if you want to create test modules for files that do not match as a test module.
Stops at first non-None result, see firstresult: stop at first non-None result.

Parameters
- module_path(pathlib.Path) – The path of the module to collect.
- path(LEGACY_PATH) – The path of the module to collect (deprecated).

Changed in version 7.0.0: The module_path parameter was added as a pathlib.Path equivalent of the path parameter.
The path parameter has been deprecated in favor of fspath.
Use in conftest plugins

Any conftest file can implement this hook. For a given parent collector, only conftest files in the collector’s directory and its parent directories are consulted.

For influencing the collection of objects in Python modules you can use the following hook:

**pytest_pycollect_makeitem** (*collector, name, obj*)

Return a custom item/collector for a Python object in a module, or None.

Stops at first non-None result, see *firstresult: stop at first non-None result*.

Parameters

- **collector** (*Module / Class*) - The module/class collector.
- **name** (*str*) - The name of the object in the module/class.
- **obj** (*object*) - The object.

Returns

The created items/collectors.

Return type

None | *Item | Collector | list[*Item | Collector*

Use in conftest plugins

Any conftest file can implement this hook. For a given collector, only conftest files in the collector’s directory and its parent directories are consulted.

**pytest_generate_tests** (*metafunc*)

Generate (multiple) parametrized calls to a test function.

Parameters

- **metafunc** (*Metafunc*) - The *Metafunc* helper for the test function.

Use in conftest plugins

Any conftest file can implement this hook. For a given function definition, only conftest files in the function’s directory and its parent directories are consulted.

**pytest_make_parametrize_id** (*config, val, argname*)

Return a user-friendly string representation of the given *val* that will be used by @pytest.mark.parametrize calls, or None if the hook doesn’t know about *val*.

The parameter name is available as *argname*, if required.

Stops at first non-None result, see *firstresult: stop at first non-None result*.

Parameters

- **config** (*Config*) - The pytest config object.
- **val** (*object*) - The parametrized value.
- **argname** (*str*) - The automatic parameter name produced by pytest.
Use in conftest plugins

Any conftest file can implement this hook.

Hooks for influencing test skipping:

**pytest_markeval_namespace** *(config)*

Called when constructing the globals dictionary used for evaluating string conditions in xfail/skipif markers.

This is useful when the condition for a marker requires objects that are expensive or impossible to obtain during collection time, which is required by normal boolean conditions.

Added in version 6.2.

**Parameters**

- config *(Config)* – The pytest config object.

**Returns**

A dictionary of additional globals to add.

**Return type**

dict[str, Any]

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in parent directories of the item are consulted.

After collection is complete, you can modify the order of items, delete or otherwise amend the test items:

**pytest_collection_modifyitems** *(session, config, items)*

Called after collection has been performed. May filter or re-order the items in-place.

**Parameters**

- session *(Session)* – The pytest session object.
- config *(Config)* – The pytest config object.
- items *(list[Item])* – List of item objects.

Use in conftest plugins

Any conftest plugin can implement this hook.

**Note:** If this hook is implemented in `conftest.py` files, it always receives all collected items, not only those under the `conftest.py` where it is implemented.

**pytest_collection_finish** *(session)*

Called after collection has been performed and modified.

**Parameters**

- session *(Session)* – The pytest session object.
Use in conftest plugins

Any conftest plugin can implement this hook.

Test running (runtest) hooks

All runtest related hooks receive a pytest.Item object.

pytest_runtestloop(session)

Perform the main runtest loop (after collection finished).

The default hook implementation performs the runtest protocol for all items collected in the session (session.items), unless the collection failed or the collectonly pytest option is set.

If at any point pytest.exit() is called, the loop is terminated immediately.

If at any point session.shouldfail or session.shouldstop are set, the loop is terminated after the runtest protocol for the current item is finished.

Parameters

 session (Session) – The pytest session object.

Stops at first non-None result, see firstresult: stop at first non-None result. The return value is not used, but only stops further processing.

Use in conftest plugins

Any conftest file can implement this hook.

pytest_runtest_protocol(item, nextitem)

Perform the runtest protocol for a single test item.

The default runtest protocol is this (see individual hooks for full details):

- pytest_runtest_logstart(nodeid, location)

- **Setup phase:**
  - call = pytest_runtest_setup(item) (wrapped in CallInfo(when="setup"))
  - report = pytest_runtest_makereport(item, call)
  - pytest_runtest_logreport(report)
  - pytest_exception_interact(call, report) if an interactive exception occurred

- **Call phase, if the setup passed and the setuponly pytest option is not set:**
  - call = pytest_runtest_call(item) (wrapped in CallInfo(when="call"))
  - report = pytest_runtest_makereport(item, call)
  - pytest_runtest_logreport(report)
  - pytest_exception_interact(call, report) if an interactive exception occurred

- **Teardown phase:**
  - call = pytest_runtest_teardown(item, nextitem) (wrapped in CallInfo(when="teardown"))
  - report = pytest_runtest_makereport(item, call)
• pytest_runtest_logreport(report)
• pytest_exception_interact(call, report) if an interactive exception occurred
• pytest_runtest_logfinish(nodeid, location)

Parameters

• **item** (Item) – Test item for which the runtest protocol is performed.

• **nextitem** (Item | None) – The scheduled-to-be-next test item (or None if this is the end my friend).

Stops at first non-None result, see **firstresult: stop at first non-None result**. The return value is not used, but only stops further processing.

**Use in conftest plugins**

Any conftest file can implement this hook.

**pytest_runtest_logstart** (nodeid, location)

Called at the start of running the runtest protocol for a single item.

See **pytest_runtest_protocol** for a description of the runtest protocol.

Parameters

• **nodeid** (str) – Full node ID of the item.

• **location** (tuple[str, int | None, str]) – A tuple of (filename, lineno, testname) where filename is a file path relative to config.rootpath and lineno is 0-based.

**Use in conftest plugins**

Any conftest file can implement this hook. For a given item, only conftest files in the item’s directory and its parent directories are consulted.

**pytest_runtest_logfinish** (nodeid, location)

Called at the end of running the runtest protocol for a single item.

See **pytest_runtest_protocol** for a description of the runtest protocol.

Parameters

• **nodeid** (str) – Full node ID of the item.

• **location** (tuple[str, int | None, str]) – A tuple of (filename, lineno, testname) where filename is a file path relative to config.rootpath and lineno is 0-based.
Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

`pytest_runtest_setup(item)`

Called to perform the setup phase for a test item.

The default implementation runs `setup()` on `item` and all of its parents (which haven't been setup yet). This includes obtaining the values of fixtures required by the item (which haven't been obtained yet).

Parameters

- `item (Item)` – The item.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

`pytest_runtest_call(item)`

Called to run the test for test item (the call phase).

The default implementation calls `item.runtest()`.

Parameters

- `item (Item)` – The item.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

`pytest_runtest_teardown(item, nextitem)`

Called to perform the teardown phase for a test item.

The default implementation runs the finalizers and calls `teardown()` on `item` and all of its parents (which need to be torn down). This includes running the teardown phase of fixtures required by the item (if they go out of scope).

Parameters

- `item (Item)` – The item.
- `nextitem (Item | None)` – The scheduled-to-be-next test item (None if no further test item is scheduled). This argument is used to perform exact teardowns, i.e. calling just enough finalizers so that nextitem only needs to call setup functions.
**Use in conftest plugins**

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

**pytest_runtest_makereport**(item, call)

Called to create a TestReport for each of the setup, call and teardown runtest phases of a test item.

See **pytest_runtest_protocol** for a description of the runtest protocol.

Parameters

- item (Item) – The item.
- call (CallInfo[None]) – The CallInfo for the phase.

Stops at first non-None result, see *firstresult: stop at first non-None result*.

**Use in conftest plugins**

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

For deeper understanding you may look at the default implementation of these hooks in _pytest.runner and maybe also in _pytest.pdb which interacts with _pytest.capture and its input/output capturing in order to immediately drop into interactive debugging when a test failure occurs.

**pytest_pyfunc_call**(pyfuncitem)

Call underlying test function.

Stops at first non-None result, see *firstresult: stop at first non-None result*.

Parameters

- pyfuncitem (Function) – The function item.

**Use in conftest plugins**

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

**Reporting hooks**

Session related reporting hooks:

**pytest_collectstart**(collector)

Collector starts collecting.

Parameters

- collector (Collector) – The collector.
Use in conftest plugins

Any conftest file can implement this hook. For a given collector, only conftest files in the collector’s directory and its parent directories are consulted.

`pytest_make_collect_report (collector)`

Perform `collector.collect()` and return a `CollectReport`.

Stops at first non-None result, see `firstresult: stop at first non-None result`.

Parameters

- `collector` (Collector) – The collector.

Use in conftest plugins

Any conftest file can implement this hook. For a given collector, only conftest files in the collector’s directory and its parent directories are consulted.

`pytest_itemcollected (item)`

We just collected a test item.

Parameters

- `item` (Item) – The item.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item’s directory and its parent directories are consulted.

`pytest_collectreport (report)`

Collector finished collecting.

Parameters

Use in conftest plugins

Any conftest file can implement this hook. For a given collector, only conftest files in the collector’s directory and its parent directories are consulted.

`pytest_deselected (items)`

Called for deselected test items, e.g. by keyword.

May be called multiple times.

Parameters

- `items` (Sequence[Item]) – The items.
Use in conftest plugins

Any conftest file can implement this hook.

pytest_report_header(config, start_path, startdir)

Return a string or list of strings to be displayed as header info for terminal reporting.

Parameters

- `config` (Config) – The pytest config object.
- `start_path` (pathlib.Path) – The starting dir.
- `startdir` (LEGACY_PATH) – The starting dir (deprecated).

Note: Lines returned by a plugin are displayed before those of plugins which ran before it. If you want to have your line(s) displayed first, use `trylast=True`.

Changed in version 7.0.0: The `start_path` parameter was added as a `pathlib.Path` equivalent of the `startdir` parameter. The `startdir` parameter has been deprecated.

Use in conftest plugins

This hook is only called for initial conftests.

pytest_report_collectionfinish(config, start_path, startdir, items)

Return a string or list of strings to be displayed after collection has finished successfully.

These strings will be displayed after the standard “collected X items” message.

Added in version 3.2.

Parameters

- `config` (Config) – The pytest config object.
- `start_path` (pathlib.Path) – The starting dir.
- `startdir` (LEGACY_PATH) – The starting dir (deprecated).
- `items` (Sequence[Item]) – List of pytest items that are going to be executed; this list should not be modified.

Note: Lines returned by a plugin are displayed before those of plugins which ran before it. If you want to have your line(s) displayed first, use `trylast=True`.

Changed in version 7.0.0: The `start_path` parameter was added as a `pathlib.Path` equivalent of the `startdir` parameter. The `startdir` parameter has been deprecated.
Use in conftest plugins

Any conftest plugin can implement this hook.

**pytest_report_teststatus**(report, config)

Return result-category, shortletter and verbose word for status reporting.

The result-category is a category in which to count the result, for example “passed”, “skipped”, “error” or the empty string.

The shortletter is shown as testing progresses, for example “.”, “s”, “E” or the empty string.

The verbose word is shown as testing progresses in verbose mode, for example “PASSED”, “SKIPPED”, “ERROR” or the empty string.

pytest may style these implicitly according to the report outcome. To provide explicit styling, return a tuple for the verbose word, for example "rerun", "R", ("RERUN", {"yellow": True}).

Parameters

- **report** *(CollectReport | TestReport)* - The report object whose status is to be returned.

- **config** *(Config)* - The pytest config object.

Returns

The test status.

Return type

*TestShortLogReport | tuple[str, str, str | tuple[str, Mapping[str, bool]]]*

Stops at first non-None result, see *firstresult* : *stop at first non-None result*.

Use in conftest plugins

Any conftest plugin can implement this hook.

**pytest_report_to_serializable**(config, report)

Serialize the given report object into a data structure suitable for sending over the wire, e.g. converted to JSON.

Parameters

- **config** *(Config)* - The pytest config object.

Use in conftest plugins

Any conftest file can implement this hook. The exact details may depend on the plugin which calls the hook.

**pytest_report_from_serializable**(config, data)

Restore a report object previously serialized with **pytest_report_to_serializable**.

Parameters

- **config** *(Config)* - The pytest config object.
Use in conftest plugins

Any conftest file can implement this hook. The exact details may depend on the plugin which calls the hook.

pytest_terminal_summary (terminalreporter, exitstatus, config)
Add a section to terminal summary reporting.

Parameters

- **terminalreporter** (TerminalReporter) – The internal terminal reporter object.
- **exitstatus** (ExitCode) – The exit status that will be reported back to the OS.
- **config** (Config) – The pytest config object.

Added in version 4.2: The config parameter.

Use in conftest plugins

Any conftest plugin can implement this hook.

pytest_fixture_setup (fixturedef, request)
Perform fixture setup execution.

Parameters

- **fixturedef** (FixtureDef[Any]) – The fixture definition object.
- **request** (SubRequest) – The fixture request object.

Returns

The return value of the call to the fixture function.

Return type

object | None

Stops at first non-None result, see firstresult: stop at first non-None result.

Note: If the fixture function returns None, other implementations of this hook function will continue to be called, according to the behavior of the firstresult: stop at first non-None result option.

Use in conftest plugins

Any conftest file can implement this hook. For a given fixture, only conftest files in the fixture scope’s directory and its parent directories are consulted.

pytest_fixture_post_finalizer (fixturedef, request)
Called after fixture teardown, but before the cache is cleared, so the fixture result fixturedef.cached_result is still available (not None).

Parameters

- **fixturedef** (FixtureDef[Any]) – The fixture definition object.
- **request** (SubRequest) – The fixture request object.
Use in conftest plugins

Any conftest file can implement this hook. For a given fixture, only conftest files in the fixture scope's directory and its parent directories are consulted.

`pytest_warning_recorded`\(\text{warning\_message, when, nodeid, location}\)

Process a warning captured by the internal pytest warnings plugin.

**Parameters**

- `warning_message` ([`warnings`\.`WarningMessage`]) – The captured warning. This is the same object produced by `warnings.catch_warnings`, and contains the same attributes as the parameters of `warnings.showwarning()`.
- `when` ([`Literal`[\{'config', 'collect', 'runtest'}]]) – Indicates when the warning was captured. Possible values:
  - "config": during pytest configuration-initialization stage.
  - "collect": during test collection.
  - "runtest": during test execution.
- `nodeid` (`str`) – Full id of the item. Empty string for warnings that are not specific to a particular node.
- `location` (tuple[`str, int, str`] | None) – When available, holds information about the execution context of the captured warning (filename, linenumber, function). `function` evaluates to `<module>` when the execution context is at the module level.

Added in version 6.0.

Use in conftest plugins

Any conftest file can implement this hook. If the warning is specific to a particular node, only conftest files in parent directories of the node are consulted.

Central hook for reporting about test execution:

`pytest_runtest_logreport`\(\text{report}\)

Process the `TestReport` produced for each of the setup, call and teardown runtest phases of an item.

See `pytest_runtest_protocol` for a description of the runtest protocol.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item's directory and its parent directories are consulted.

Assertion related hooks:

`pytest_assertrepr_compare`\(\text{config, op, left, right}\)

Return explanation for comparisons in failing assert expressions.

Return None for no custom explanation, otherwise return a list of strings. The strings will be joined by newlines but any newlines in a string will be escaped. Note that all but the first line will be indented slightly, the intention is for the first line to be a summary.
Parameters

- `config` (Config) – The pytest config object.
- `op` (str) – The operator, e.g. "==", "!=", "not in".
- `left` (object) – The left operand.
- `right` (object) – The right operand.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item’s directory and its parent directories are consulted.

`pytest_assertion_pass` (item, lineno, orig, expl)

Called whenever an assertion passes.

Added in version 5.0.

Use this hook to do some processing after a passing assertion. The original assertion information is available in the `orig` string and the pytest introspected assertion information is available in the `expl` string.

This hook must be explicitly enabled by the `enable_assertion_pass_hook` ini-file option:

```
[pytest]
enable_assertion_pass_hook=true
```

You need to clean the `.pyc` files in your project directory and interpreter libraries when enabling this option, as assertions will require to be re-written.

Parameters

- `item` (Item) – pytest item object of current test.
- `lineno` (int) – Line number of the assert statement.
- `orig` (str) – String with the original assertion.
- `expl` (str) – String with the assert explanation.

Use in conftest plugins

Any conftest file can implement this hook. For a given item, only conftest files in the item’s directory and its parent directories are consulted.

Debugging/Interaction hooks

There are few hooks which can be used for special reporting or interaction with exceptions:

`pytest_internalerror` (excrepr, excinfo)

Called for internal errors.

Return True to suppress the fallback handling of printing an INTERNALERROR message directly to sys.stderr.

Parameters

- `excrepr` (ExceptionRepr) – The exception repr object.
- `excinfo` (ExceptionInfo[BaseException]) – The exception info.
Use in conftest plugins

Any conftest plugin can implement this hook.

**pytest_keyboard_interrupt (excinfo)**

Called for keyboard interrupt.

Parameters

- **excinfo** ([ExceptionInfo[KeyboardInterrupt / Exit]]) – The exception info.

Use in conftest plugins

Any conftest plugin can implement this hook.

**pytest_exception_interact (node, call, report)**

Called when an exception was raised which can potentially be interactively handled.

May be called during collection (see `pytest_make_collect_report`), in which case `report` is a `CollectReport`.

May be called during runtest of an item (see `pytest_runtest_protocol`), in which case `report` is a `TestReport`.

This hook is not called if the exception that was raised is an internal exception like `skip.Exception`.

Parameters

- **node** ([Item / Collector]) – The item or collector.
- **call** ([CallInfo[Any]]) – The call information. Contains the exception.
- **report** ([CollectReport / TestReport]) – The collection or test report.

Use in conftest plugins

Any conftest file can implement this hook. For a given node, only conftest files in parent directories of the node are consulted.

**pytest_enter_pdb (config, pdb)**

Called upon `pdb.set_trace()`.

Can be used by plugins to take special action just before the python debugger enters interactive mode.

Parameters

- **config** ([Config]) – The pytest config object.
- **pdb** ([pdb.Pdb]) – The Pdb instance.
Use in conftest plugins

Any conftest plugin can implement this hook.

```python
pytest_leave_pdb(config, pdb)
```

Called when leaving `pdb` (e.g. with `continue` after `pdb.set_trace()`).

Can be used by plugins to take special action just after the python debugger leaves interactive mode.

**Parameters**

- `config (Config)` – The pytest config object.
- `pdb (pdb.Pdb)` – The Pdb instance.

Use in conftest plugins

Any conftest plugin can implement this hook.

3.4.6 Collection tree objects

These are the collector and item classes (collectively called “nodes”) which make up the collection tree.

Node

```python
class Node
```

Base class of `Collector` and `Item`, the components of the test collection tree.

Collector's are the internal nodes of the tree, and Item's are the leaf nodes.

**Attributes**

- `fspath: LEGACY_PATH`
  
  A LEGACY_PATH copy of the `path` attribute. Intended for usage for methods not migrated to `pathlib.Path` yet, such as `Item.reportinfo`. Will be deprecated in a future release, prefer using `path` instead.

- `name: str`
  
  A unique name within the scope of the parent node.

- `parent`
  
  The parent collector node.

- `config: Config`
  
  The pytest config object.

- `session: Session`
  
  The pytest session this node is part of.

- `path: pathlib.Path`
  
  Filesystem path where this node was collected from (can be None).

- `keywords: MutableMapping[str, Any]`
  
  Keywords/markers collected from all scopes.
own_markers: list[Mark]
The marker objects belonging to this node.

extra_keyword_matches: set[str]
Allow adding of extra keywords to use for matching.

stash: Stash
A place where plugins can store information on the node for their own use.

classmethod from_parent (parent, **kw)
Public constructor for Nodes.
This indirection got introduced in order to enable removing the fragile logic from the node constructors.
Subclasses can use super().from_parent(...) when overriding the construction.

Parameters
parent (Node) – The parent node of this Node.

property ihook: HookRelay
fspath-sensitive hook proxy used to call pytest hooks.

warn (warning)
Issue a warning for this Node.
Warnings will be displayed after the test session, unless explicitly suppressed.

Parameters
warning (Warning) – The warning instance to issue.

Raises
ValueError – If warning instance is not a subclass of Warning.

Example usage:

```python
node.warn(PytestWarning("some message"))
node.warn(UserWarning("some message"))
```

Changed in version 6.2: Any subclass of Warning is now accepted, rather than only PytestWarning subclasses.

property nodeid: str
A ::-separated string denoting its collection tree address.

for ... in iter_parents ()
Iterate over all parent collectors starting from and including self up to the root of the collection tree.

Added in version 8.1.

listchain ()
Return a list of all parent collectors starting from the root of the collection tree down to and including self.

add_marker (marker, append=True)
Dynamically add a marker object to the node.

Parameters

- marker (str / MarkDecorator) – The marker.
• `append (bool)` – Whether to append the marker, or prepend it.

```python
def iter_markers (name=None)
    Iterate over all markers of the node.
```

**Parameters**

- `name (str | None)` – If given, filter the results by the name attribute.

**Returns**

An iterator of the markers of the node.

**Return type**

`Iterator[Mark]`

```python
for ... in iter_markers_with_node (name=None)
    Iterate over all markers of the node.
```

**Parameters**

- `name (str | None)` – If given, filter the results by the name attribute.

**Returns**

An iterator of (node, mark) tuples.

**Return type**

`Iterator[tuple[Node, Mark]]`

```python
def get_closest_marker (name: str) -> Mark | None
```

**get_closest_marker (name: str, default: Mark) -> Mark**

Return the first marker matching the name, from closest (for example function) to farther level (for example module level).

**Parameters**

- `default` – Fallback return value if no marker was found.
- `name` – Name to filter by.

```python
def listextrakeywords ()
    Return a set of all extra keywords in self and any parents.
```

```python
def addfinalizer (fin)
    Register a function to be called without arguments when this node is finalized.

    This method can only be called when this node is active in a setup chain, for example during self.setup().
```

```python
def getparent (cls)
    Get the closest parent node (including self) which is an instance of the given class.
```

**Parameters**

- `cls (type[_NodeType])` – The node class to search for.

**Returns**

The node, if found.

**Return type**

`_NodeType | None`
repr_failure(excinfo, style=None)
    Return a representation of a collection or test failure.

    See also:
    * Working with non-python tests

Parameters
    excinfo (ExceptionInfo[BaseException]) – Exception information for the fail-
    ure.

Collector

class Collector
    Bases: Node, ABC
    
    Base class of all collectors.
    
    Collector create children through collect() and thus iteratively build the collection tree.

exception CollectError
    Bases: Exception
    
    An error during collection, contains a custom message.

abstractmethod collect()
    Collect children (items and collectors) for this collector.

repr_failure(excinfo)
    Return a representation of a collection failure.

    Parameters
    excinfo (ExceptionInfo[BaseException]) – Exception information for the fail-
    ure.

name: str
    A unique name within the scope of the parent node.

parent
    The parent collector node.

config: Config
    The pytest config object.

session: Session
    The pytest session this node is part of.

path: pathlib.Path
    Filesystem path where this node was collected from (can be None).
Item

class Item
Bases: Node, ABC

Base class of all test invocation items.
Note that for a single function there might be multiple test invocation items.

user_properties: list[tuple[str, object]]
A list of tuples (name, value) that holds user defined properties for this test.

name: str
A unique name within the scope of the parent node.

parent
The parent collector node.

config: Config
The pytest config object.

session: Session
The pytest session this node is part of.

path: pathlib.Path
Filesystem path where this node was collected from (can be None).

abstractmethod runtest()
Run the test case for this item.
Must be implemented by subclasses.

See also:
Working with non-python tests

add_report_section(when, key, content)
Add a new report section, similar to what’s done internally to add stdout and stderr captured output:

```
item.add_report_section("call", "stdout", "report section contents")
```

Parameters

- when (str) – One of the possible capture states, "setup", "call", "teardown".
- key (str) – Name of the section, can be customized at will. Pytest uses "stdout" and "stderr" internally.
- content (str) – The full contents as a string.

reportinfo()
Get location information for this item for test reports.
Returns a tuple with three elements:

- The path of the test (default self.path)
• The 0-based line number of the test (default None)
• A name of the test to be shown (default "")

See also:

Working with non-python tests

**property location:** `tuple[str, int | None, str]`

Returns a tuple of `(relefspath, lineno, testname)` for this item where `relefspath` is file path relative to `config.rootpath` and `lineno` is a 0-based line number.

**File**

class File

Bases: `FSCollector`, `ABC`

Base class for collecting tests from a file.

Working with non-python tests.

**name:** `str`

A unique name within the scope of the parent node.

**parent**

The parent collector node.

**config:** `Config`

The pytest config object.

**session:** `Session`

The pytest session this node is part of.

**path:** `pathlib.Path`

Filesystem path where this node was collected from (can be None).

**FSCollector**

class FSCollector

Bases: `Collector`, `ABC`

Base class for filesystem collectors.

**path:** `pathlib.Path`

Filesystem path where this node was collected from (can be None).

**classmethod from_parent** (parent, *, filepath=None, path=None, **kw)

The public constructor.
**name:** `str`

A unique name within the scope of the parent node.

**parent**

The parent collector node.

**config:** `Config`

The pytest config object.

**session:** `Session`

The pytest session this node is part of.

---

### Session

**final class Session**

**Bases:** `Collector`

The root of the collection tree.

*Session* collects the initial paths given as arguments to *pytest*.

**exception Interrupted**

**Bases:** `KeyboardInterrupt`

Signals that the test run was interrupted.

**exception Failed**

**Bases:** `Exception`

Signals a stop as failed test run.

**property startpath:** `Path`

The path from which *pytest* was invoked.

Added in version 7.0.0.

**isinitpath** (`path`, `*`, `with_parents=False`)

Is path an initial path?

An initial path is a path explicitly given to *pytest* on the command line.

**Parameters**

- **with_parents** (`bool`): If set, also return `True` if the path is a parent of an initial path.

  Changed in version 8.0: Added the `with_parents` parameter.

**perform_collect** (`args: Sequence[str]` | `None = None`, `genitems: Literal[True] = True`) → `Sequence[Item]`

Perform the collection phase for this session.

This is called by the default *pytest_collection* hook implementation; see the documentation of this hook for more details. For testing purposes, it may also be called directly on a fresh *Session*.

This function normally recursively expands any collectors collected from the session to their items, and only items are returned. For testing purposes, this may be suppressed by passing `genitems=False`, in which case the return value contains these collectors unexpanded, and `session.items` is empty.
for ... in collect()
    Collect children (items and collectors) for this collector.

name:  str
    A unique name within the scope of the parent node.

parent
    The parent collector node.

config:  Config
    The pytest config object.

session:  Session
    The pytest session this node is part of.

path:  pathlib.Path
    Filesystem path where this node was collected from (can be None).

Package

class Package
    Bases: Directory
    Collector for files and directories in a Python packages – directories with an __init__.py file.

    Note: Directories without an __init__.py file are instead collected by Dir by default. Both are Directory collectors.

    Changed in version 8.0: Now inherits from Directory.

for ... in collect()
    Collect children (items and collectors) for this collector.

name:  str
    A unique name within the scope of the parent node.

parent
    The parent collector node.

config:  Config
    The pytest config object.

session:  Session
    The pytest session this node is part of.

path:  pathlib.Path
    Filesystem path where this node was collected from (can be None).
**Module**

```python
class Module:
    Bases: File, PyCollector
    Collector for test classes and functions in a Python module.

    def collect(self):
        Collect children (items and collectors) for this collector.

    name: str
        A unique name within the scope of the parent node.

    parent
        The parent collector node.

    config: Config
        The pytest config object.

    session: Session
        The pytest session this node is part of.

    path: pathlib.Path
        Filesystem path where this node was collected from (can be None).
```

**Class**

```python
class Class:
    Bases: PyCollector
    Collector for test methods (and nested classes) in a Python class.

    @classmethod
    def from_parent(parent, *, name, obj=None, **kw):
        The public constructor.

    def collect(self):
        Collect children (items and collectors) for this collector.

    name: str
        A unique name within the scope of the parent node.

    parent
        The parent collector node.

    config: Config
        The pytest config object.

    session: Session
        The pytest session this node is part of.
```
path: `pathlib.Path`

Filesystem path where this node was collected from (can be None).

**Function**

class Function

    Bases: `PyobjMixin`, `Item`

Item responsible for setting up and executing a Python test function.

**Parameters**

- `name` - The full function name, including any decorations like those added by parametrization (`my_func[my_param]`).
- `parent` - The parent Node.
- `config` - The pytest Config object.
- `callspec` - If given, this function has been parametrized and the callspec contains meta information about the parametrization.
- `callobj` - If given, the object which will be called when the Function is invoked, otherwise the callobj will be obtained from `parent` using `originalname`.
- `keywords` - Keywords bound to the function object for “-k” matching.
- `session` - The pytest Session object.
- `fixtureinfo` - Fixture information already resolved at this fixture node..
- `originalname` - The attribute name to use for accessing the underlying function object. Defaults to `name`. Set this if name is different from the original name, for example when it contains decorations like those added by parametrization (`my_func[my_param]`).

**originalname**

Original function name, without any decorations (for example parametrization adds a "[...]" suffix to function names), used to access the underlying function object from `parent` (in case `callobj` is not given explicitly).

Added in version 3.0.

**classmethod from_parent**(parent, **kw)

The public constructor.

**property function**

Underlying python `function` object.

**property instance**

Python instance object the function is bound to.

Returns None if not a test method, e.g. for a standalone test function, a class or a module.

**runttest**(())

Execute the underlying test function.
repr_failure(excinfo)

Return a representation of a collection or test failure.

See also:

Working with non-python tests

Parameters

excinfo (ExceptionInfo[BaseException]) – Exception information for the failure.

name: str

A unique name within the scope of the parent node.

parent

The parent collector node.

config: Config

The pytest config object.

session: Session

The pytest session this node is part of.

path: pathlib.Path

Filesystem path where this node was collected from (can be None).

FunctionDefinition

class FunctionDefinition

Bases: Function

This class is a stop gap solution until we evolve to have actual function definition nodes and manage to get rid of metafunc.

runtest ()

Execute the underlying test function.

name: str

A unique name within the scope of the parent node.

parent

The parent collector node.

config: Config

The pytest config object.

session: Session

The pytest session this node is part of.

path: pathlib.Path

Filesystem path where this node was collected from (can be None).
setup()
   Execute the underlying test function.

3.4.7 Objects

Objects accessible from fixtures or hooks or importable from pytest.

CallInfo

final class CallInfo
   Result/Exception info of a function invocation.

   excinfo: ExceptionInfo[BaseException] | None
      The captured exception of the call, if it raised.

   start: float
      The system time when the call started, in seconds since the epoch.

   stop: float
      The system time when the call ended, in seconds since the epoch.

   duration: float
      The call duration, in seconds.

   when: Literal['collect', 'setup', 'call', 'teardown']
      The context of invocation: “collect”, “setup”, “call” or “teardown”.

   property result: TResult
      The return value of the call, if it didn’t raise.

      Can only be accessed if excinfo is None.

   classmethod from_call(func, when, reraise=None)
      Call func, wrapping the result in a CallInfo.

      Parameters

      • func (Callable[], _pytest.runner.TResult) – The function to call.
        Called without arguments.

      • when(Literal['collect', 'setup', 'call', 'teardown']) – The phase
        in which the function is called.

      • reraise(type[BaseException] | tuple[type[BaseException], ...]
        | None) – Exception or exceptions that shall propagate if raised by the function, instead
        of being wrapped in the CallInfo.
CollectReport

final class CollectReport
Bases: BaseReport
Collection report object.
Reports can contain arbitrary extra attributes.

nodeid: str
Normalized collection nodeid.

outcome: Literal['passed', 'failed', 'skipped']
Test outcome, always one of “passed”, “failed”, “skipped”.

longrepr: None | ExceptionInfo[BaseException] | tuple[str, int, str] | str | TerminalRepr
None or a failure representation.

result
The collected items and collection nodes.

sections: list[tuple[str, str]]
Tuples of str (heading, content) with extra information for the test report. Used by pytest to add text captured from stdout, stderr, and intercepted logging events. May be used by other plugins to add arbitrary information to reports.

property caplog: str
Return captured log lines, if log capturing is enabled.
Added in version 3.5.

property capstderr: str
Return captured text from stderr, if capturing is enabled.
Added in version 3.0.

property capstdout: str
Return captured text from stdout, if capturing is enabled.
Added in version 3.0.

property count_towards_summary: bool
Experimental Whether this report should be counted towards the totals shown at the end of the test session: “1 passed, 1 failure, etc”.

Note: This function is considered experimental, so beware that it is subject to changes even in patch releases.

property failed: bool
Whether the outcome is failed.

property fspath: str
The path portion of the reported node, as a string.
property head_line: str | None

Experimental The head line shown with longrepr output for this report, more commonly during traceback representation during failures:

```
________ Test.foo ________
```

In the example above, the head_line is “Test.foo”.

Note: This function is considered experimental, so beware that it is subject to changes even in patch releases.

property longreprtext: str

Read-only property that returns the full string representation of longrepr.

Added in version 3.0.

property passed: bool

Whether the outcome is passed.

property skipped: bool

Whether the outcome is skipped.

Config

final class Config

Access to configuration values, pluginmanager and plugin hooks.

Parameters

- pluginmanager (PytestPluginManager) – A pytest PluginManager.
- invocation_params (InvocationParams) – Object containing parameters regarding the pytest.main() invocation.

final class InvocationParams (*, args, plugins, dir)

Holds parameters passed during pytest.main().

The object attributes are read-only.

Added in version 5.1.

Note: Note that the environment variable PYTEST_ADDOPTS and the addopts ini option are handled by pytest, not being included in the args attribute.

Plugins accessing InvocationParams must be aware of that.

args: tuple[str, ...]

The command-line arguments as passed to pytest.main().

plugins: Sequence[str | object] | None

Extra plugins, might be None.
dir: Path
   The directory from which `pytest.main()` was invoked. :type: pathlib.Path

class ArgsSource(value, names=<not given>, *values, module=None, qualname=None, type=None, start=1, boundary=None)
   Indicates the source of the test arguments.
   Added in version 7.2.
ARGS = 1
   Command line arguments.
INVOCATION_DIR = 2
   Invocation directory.
TESTPATHS = 3
   'testpaths' configuration value.

option
   Access to command line option as attributes.
       Type
           argparse.Namespace

invocation_params
   The parameters with which pytest was invoked.
       Type
           InvocationParams

pluginmanager
   The plugin manager handles plugin registration and hook invocation.
       Type
           PytestPluginManager

stash
   A place where plugins can store information on the config for their own use.
       Type
           Stash

property rootpath: Path
   The path to the `rootdir`.
       Type
           pathlib.Path
   Added in version 6.1.

property inipath: Path | None
   The path to the `configfile`.
   Added in version 6.1.

add_cleanup(func)
   Add a function to be called when the config object gets out of use (usually coinciding with pytest_unconfigure).
**classmethod fromdictargs** *(option_dict, args)*

Constructor usable for subprocesses.

**issue_config_time_warning** *(warning, stacklevel)*

Issue and handle a warning during the “configure” stage.

During `pytest_configure` we can’t capture warnings using the `catch_warnings_for_item` function because it is not possible to have hook wrappers around `pytest_configure`.

This function is mainly intended for plugins that need to issue warnings during `pytest_configure` (or similar stages).

**Parameters**

- `warning` (*Warning*) – The warning instance.
- `stacklevel` (*int*) – stacklevel forwarded to `warnings.warn`.

**addinivalue_line** *(name, line)*

Add a line to an ini-file option. The option must have been declared but might not yet be set in which case the line becomes the first line in its value.

**getini** *(name)*

Return configuration value from an ini file.

If a configuration value is not defined in an ini file, then the default value provided while registering the configuration through `parser.addini` will be returned. Please note that you can even provide `None` as a valid default value.

If default is not provided while registering using `parser.addini`, then a default value based on the type parameter passed to `parser.addini` will be returned. The default values based on type are: `paths`, `pathlist`, `args` and `linelist` : `empty list` [], `bool`: `False` string : `empty string " "`

If neither the default nor the type parameter is passed while registering the configuration through `parser.addini`, then the configuration is treated as a string and a default empty string “” is returned.

If the specified name hasn’t been registered through a prior `parser.addini` call (usually from a plugin), a ValueError is raised.

**getoption** *(name, default=<NOTSET>, skip=False)*

Return command line option value.

**Parameters**

- `name` (*str*) – Name of the option. You may also specify the literal `--OPT` option instead of the “dest” option name.
- `default` – Default value if no option of that name exists.
- `skip` (*bool*) – If True, raise pytest.skip if option does not exists or has a None value.

**getvalue** *(name, path=None)*

Deprecated, use getoption() instead.
getvalueorskip(name, path=None)
Deprecated, use getoption(skip=True) instead.

VERBOSITY_ASSERTIONS: Final = 'assertions'
Verbosity type for failed assertions (see verbosity_assertions).

VERBOSITY_TEST_CASES: Final = 'test_cases'
Verbosity type for test case execution (see verbosity_test_cases).

get_verbosity(verbosity_type=None)
Retrieve the verbosity level for a fine-grained verbosity type.

Parameters

    verbosity_type (str | None) – Verbosity type to get level for. If a level is configured
for the given type, that value will be returned. If the given type is not a known verbosity type, the
global verbosity level will be returned. If the given type is None (default), the global verbosity
level will be returned.

To configure a level for a fine-grained verbosity type, the configuration file should have a setting for the
configuration name and a numeric value for the verbosity level. A special value of “auto” can be used to
explicitly use the global verbosity level.

Example:

```ini
# content of pytest.ini
[pytest]
verbosity_assertions = 2
```

```bash
pytest -v
```

```python
print(config.get_verbosity())  # 1
print(config.get_verbosity(Config.VERBOSITY_ASSERTIONS))  # 2
```

Dir

class Dir
Collector of files in a file system directory.

Added in version 8.0.

Note: Python directories with an __init__.py file are instead collected by Package by default. Both are
Directory collectors.

classmethod from_parent(parent, *, path)
The public constructor.

Parameters

    • parent (nodes.Collector) – The parent collector of this Dir.
    • path (pathlib.Path) – The directory's path.
for ... in collect()
    Collect children (items and collectors) for this collector.

name:  str
    A unique name within the scope of the parent node.

parent
    The parent collector node.

config:  Config
    The pytest config object.

session:  Session
    The pytest session this node is part of.

path:  pathlib.Path
    Filesystem path where this node was collected from (can be None).

Directory

class Directory
    Base class for collecting files from a directory.

    A basic directory collector does the following: goes over the files and sub-directories in the directory and creates collectors for them by calling the hooks pytest_collect_directory and pytest_collect_file, after checking that they are not ignored using pytest_ignore_collect.

    The default directory collectors are Dir and Package.

    Added in version 8.0.

    Using a custom directory collector.

name:  str
    A unique name within the scope of the parent node.

parent
    The parent collector node.

config:  Config
    The pytest config object.

session:  Session
    The pytest session this node is part of.

path:  pathlib.Path
    Filesystem path where this node was collected from (can be None).
**ExceptionInfo**

**final class ExceptionInfo**
Wraps sys.exc_info() objects and offers help for navigating the traceback.

**classmethod from_exception**(exception, exprinfo=None)
Return an ExceptionInfo for an existing exception.

The exception must have a non-None __traceback__ attribute, otherwise this function fails with an assertion error. This means that the exception must have been raised, or added a traceback with the with_traceback() method.

**Parameters**
- **exprinfo (str | None)** – A text string helping to determine if we should strip AssertionError from the output. Defaults to the exception message/str().

Added in version 7.4.

**classmethod from_exc_info**(exc_info, exprinfo=None)
Like from_exception(), but using old-style exc_info tuple.

**classmethod from_current**(exprinfo=None)
Return an ExceptionInfo matching the current traceback.

**Warning:** Experimental API

**Parameters**
- **exprinfo (str | None)** – A text string helping to determine if we should strip AssertionError from the output. Defaults to the exception message/str().

**classmethod for_later**()
Return an unfilled ExceptionInfo.

**fill_unfilled**(exc_info)
Fill an unfilled ExceptionInfo created with for_later().

**property type:** type[E]
The exception class.

**property value:** E
The exception value.

**property tb:** TracebackType
The exception raw traceback.

**property typename:** str
The type name of the exception.

**property traceback:** Traceback
The traceback.
**exconly** *(tryshort=False)*

Return the exception as a string.

When ‘tryshort’ resolves to True, and the exception is an AssertionError, only the actual exception part of the exception representation is returned (so ‘AssertionError:’ is removed from the beginning).

**errisinstance** *(exc)*

Return True if the exception is an instance of exc.

Consider using `isinstance(excinfo.value, exc)` instead.

**getrepr** *(showlocals=False, style='long', abspath=False, tbfilter=True, funcargs=False, truncate_locals=True, truncate_args=True, chain=True)*

Return str()able representation of this exception info.

**Parameters**

- **showlocals** *(bool)* – Show locals per traceback entry. Ignored if `style=="native"`.
- **style** *(str)* – long|short|line|no|native value traceback style.
- **abspath** *(bool)* – If paths should be changed to absolute or left unchanged.
- **tbfilter** *(bool | Callable[[ExceptionInfo[BaseException]], Traceback])* – A filter for traceback entries.
  - If false, don’t hide any entries.
  - If true, hide internal entries and entries that contain a local variable `__traceback-hide__ = True`.
  - If a callable, delegates the filtering to the callable.
  Ignored if `style` is "native".
- **funcargs** *(bool)* – Show fixtures (“funcargs” for legacy purposes) per traceback entry.
- **truncate_locals** *(bool)* – With `showlocals==True`, make sure locals can be safely represented as strings.
- **truncate_args** *(bool)* – With `showargs==True`, make sure args can be safely represented as strings.
- **chain** *(bool)* – If chained exceptions in Python 3 should be shown.

Changed in version 3.9: Added the `chain` parameter.

**match** *(regexp)*

Check whether the regular expression `regexp` matches the string representation of the exception using `re.search()`.

If it matches `True` is returned, otherwise an `AssertionError` is raised.

**group_contains** *(expected_exception, *, match=None, depth=None)*

Check whether a captured exception group contains a matching exception.

**Parameters**
• **expected_exception** *(Type[BaseException] | Tuple[Type[BaseException]])* – The expected exception type, or a tuple if one of multiple possible exception types are expected.

• **match**(str | Pattern[str] | None) – If specified, a string containing a regular expression, or a regular expression object, that is tested against the string representation of the exception and its PEP-678 <https://peps.python.org/pep-0678/> __notes__ using `re.search()`.

  To match a literal string that may contain special characters, the pattern can first be escaped with `re.escape()`.

• **depth**(Optional[int]) – If None, will search for a matching exception at any nesting depth. If >= 1, will only match an exception if it’s at the specified depth (depth = 1 being the exceptions contained within the topmost exception group).

  Added in version 8.0.

### ExitCode

```python
class ExitCode:
```

Encodes the valid exit codes by pytest.

Currently users and plugins may supply other exit codes as well.

Added in version 5.0.

```python
OK = 0
Tests passed.
```

```python
TESTS_FAILED = 1
Tests failed.
```

```python
INTERRUPTED = 2
pytest was interrupted.
```

```python
INTERNAL_ERROR = 3
An internal error got in the way.
```

```python
USAGE_ERROR = 4
pytest was misused.
```

```python
NO_TESTS_COLLECTED = 5
pytest couldn't find tests.
```

### FixtureDef

```python
class FixtureDef:
```

A container for a fixture definition.

Note: At this time, only explicitly documented fields and methods are considered public stable API.
property scope: Literal['session', 'package', 'module', 'class', 'function']

Scope string, one of “function”, “class”, “module”, “package”, “session”.

execute (request)

Return the value of this fixture, executing it if not cached.

MarkDecorator

class MarkDecorator

A decorator for applying a mark on test functions and classes.

MarkDecorators are created with pytest.mark:

```python
mark1 = pytest.mark.NAME   # Simple MarkDecorator
mark2 = pytest.mark.NAME(name1=value)   # Parametrized MarkDecorator
```

and can then be applied as decorators to test functions:

```python
@mark2
def test_function():
    pass
```

When a MarkDecorator is called, it does the following:

1. If called with a single class as its only positional argument and no additional keyword arguments, it attaches the mark to the class so it gets applied automatically to all test cases found in that class.

2. If called with a single function as its only positional argument and no additional keyword arguments, it attaches the mark to the function, containing all the arguments already stored internally in the MarkDecorator.

3. When called in any other case, it returns a new MarkDecorator instance with the original MarkDecorator's content updated with the arguments passed to this call.

Note: The rules above prevent a MarkDecorator from storing only a single function or class reference as its positional argument with no additional keyword or positional arguments. You can work around this by using with_args().

property name: str

Alias for mark.name.

property args: tuple[Any, ...]

Alias for mark.args.

property kwargs: Mapping[str, Any]

Alias for mark.kwargs.

with_args (*args, **kwargs)

Return a MarkDecorator with extra arguments added.

Unlike calling the MarkDecorator, with_args() can be used even if the sole argument is a callable/class.
MarkGenerator

**final class** MarkGenerator

Factory for `MarkDecorator` objects - exposed as a `pytest.mark` singleton instance.

Example:

```python
import pytest

@pytest.mark.slowtest
def test_function():
    pass
```

applies a `slowtest` `Mark` on `test_function`.

Mark

**final class** Mark

A pytest mark.

- **name**: `str`
  - Name of the mark.
- **args**: `tuple[Any, ...]`
  - Positional arguments of the mark decorator.
- **kwargs**: `Mapping[str, Any]`
  - Keyword arguments of the mark decorator.
- **combined_with** *(other)*
  - Return a new Mark which is a combination of this Mark and another Mark.
  - Combines by appending args and merging kwargs.

  **Parameters**
  - **other** *(Mark)* – The mark to combine with.

  **Return type**
  - `Mark`

Metafunc

**final class** Metafunc

Objects passed to the `pytest_generate_tests` hook.

They help to inspect a test function and to generate tests according to test configuration or values specified in the class or module where a test function is defined.

**definition**

Access to the underlying `_pytest.python.FunctionDefinition`.
config
Access to the pytest.Config object for the test session.

module
The module object where the test function is defined in.

function
Underlying Python test function.

fixturenames
Set of fixture names required by the test function.

cls
Class object where the test function is defined in or None.

parametrize *(argnames, argvalues, indirect=False, ids=None, scope=None, *, _param_mark=None)*
Add new invocations to the underlying test function using the list of argvalues for the given argnames. Parametrization is performed during the collection phase. If you need to setup expensive resources see about setting indirect to do it rather than at test setup time.

Can be called multiple times per test function (but only on different argument names), in which case each call parametrizes all previous parametrizations, e.g.

```python
unparametrized: t
parametrize ["x", "y"]: t[x], t[y]
parametrize [1, 2]: t[x-1], t[x-2], t[y-1], t[y-2]
```

Parameters
- **argnames** *(str | Sequence[str])* – A comma-separated string denoting one or more argument names, or a list/tuple of argument strings.
- **argvalues** *(Iterable[_pytest.mark.structures.ParameterSet | Sequence[object] | object])* – The list of argvalues determines how often a test is invoked with different argument values.

If only one argname was specified argvalues is a list of values. If N argnames were specified, argvalues must be a list of N-tuples, where each tuple-element specifies a value for its respective argname.

- **indirect** *(bool | Sequence[str])* – A list of arguments’ names (subset of argnames) or a boolean. If True the list contains all names from the argnames. Each argvalue corresponding to an argname in this list will be passed as request.param to its respective argname fixture function so that it can perform more expensive setups during the setup phase of a test rather than at collection time.

- **ids** *(Iterable[object | None] | Callable[[Any], object | None] | None)* – Sequence of (or generator for) ids for argvalues, or a callable to return part of the id for each argvalue.

With sequences (and generators like itertools.count()) the returned ids should be of type string, int, float, bool, or None. They are mapped to the corresponding index in argvalues. None means to use the auto-generated id.

If it is a callable it will be called for each entry in argvalues, and the return value is used as part of the auto-generated id for the whole set (where parts are joined with dashes ("-")). This is useful to provide more specific ids for certain items, e.g. dates. Returning None will use an auto-generated id.

If no ids are provided they will be generated automatically from the argvalues.
• **scope** *(Literal['session', 'package', 'module', 'class', 'function'] | None)* – If specified it denotes the scope of the parameters. The scope is used for grouping tests by parameter instances. It will also override any fixture-function defined scope, allowing to set a dynamic scope using test context or configuration.

### Parser

**final class Parser**

Parser for command line arguments and ini-file values.

**Variables**

- **extra_info** – Dict of generic param -> value to display in case there's an error processing the command line arguments.

**getgroup** *(name, description='', after=None)*

Get (or create) a named option Group.

**Parameters**

- **name** *(str)* – Name of the option group.
- **description** *(str)* – Long description for -help output.
- **after** *(str | None)* – Name of another group, used for ordering -help output.

**Returns**

The option group.

**Return type**

*OptionGroup*

The returned group object has an addoption method with the same signature as `parser.addoption` but will be shown in the respective group in the output of `pytest --help`.

**addoption** *(*opts, **attrs)*

Register a command line option.

**Parameters**

- **opts** *(str)* – Option names, can be short or long options.
- **attrs** *(Any)* – Same attributes as the argparse library's `add_argument()` function accepts.

After command line parsing, options are available on the pytest config object via `config.option`. NAME where NAME is usually set by passing a `dest` attribute, for example `addoption("--long", dest="NAME", ...)`.  

**parse_known_args** *(args, namespace=None)*

Parse the known arguments at this point.

**Returns**

An argparse namespace object.

**Return type**

*Namespace*

**parse_known_and_unknown_args** *(args, namespace=None)*

Parse the known arguments at this point, and also return the remaining unknown arguments.
Returns
A tuple containing an argparse namespace object for the known arguments, and a list of the unknown arguments.

Return type
tuple[Namespace, list[str]]

addini (name, help, type=None, default=None)
Register an ini-file option.

Parameters
• **name (str)** – Name of the ini-variable.
• **type (Literal['string', 'paths', 'pathlist', 'args', 'linelist', 'bool'] | None) – Type of the variable. Can be:
  - string: a string
  - bool: a boolean
  - args: a list of strings, separated as in a shell
  - linelist: a list of strings, separated by line breaks
  - paths: a list of pathlib.Path, separated as in a shell
  - pathlist: a list of py.path, separated as in a shell
For paths and pathlist types, they are considered relative to the ini-file. In case the execution is happening without an ini-file defined, they will be considered relative to the current working directory (for example with --override-ini).

Added in version 7.0: The paths variable type.

Added in version 8.1: Use the current working directory to resolve paths and pathlist in the absence of an ini-file.

Defaults to string if None or not passed.

• **default (Any)** – Default value if no ini-file option exists but is queried.

The value of ini-variables can be retrieved via a call to config.getini(name).

OptionGroup
class OptionGroup
A group of options shown in its own section.

addoption (*opts, **attrs)
Add an option to this group.

If a shortened version of a long option is specified, it will be suppressed in the help. addoption ('--twowords', '--two-words') results in help showing --two-words only, but --twowords gets accepted and the automatic destination is in args.twowords.

Parameters
• **opts (str)** – Option names, can be short or long options.
• **attrs (Any)** – Same attributes as the argparse library's add_argument() function accepts.
PytestPluginManager

**final class PytestPluginManager**

**Bases:** PluginManager

A pluggy.PluginManager with additional pytest-specific functionality:

- Loading plugins from the command line, PYTEST_PLUGINS env variable and pytest_plugins global variables found in plugins being loaded.
- conftest.py loading during start-up.

**register** *(plugin, name=None)*

Register a plugin and return its name.

**Parameters**

- **name** *(str | None)* – The name under which to register the plugin. If not specified, a name is generated using get_canonical_name().

**Returns**

The plugin name. If the name is blocked from registering, returns None.

**Return type**

str | None

If the plugin is already registered, raises a ValueError.

**getplugin** *(name)*

**hasplugin** *(name)*

Return whether a plugin with the given name is registered.

**import_plugin** *(modname, consider_entry_points=False)*

Import a plugin with modname.

If consider_entry_points is True, entry point names are also considered to find a plugin.

**add_hookcall_monitoring** *(before, after)*

Add before/after tracing functions for all hooks.

Returns an undo function which, when called, removes the added tracers.

before(hook_name, hook_impls, kwargs) will be called ahead of all hook calls and receive a hookcaller instance, a list of HookImpl instances and the keyword arguments for the hook call.

after(outcome, hook_name, hook_impls, kwargs) receives the same arguments as before but also a Result object which represents the result of the overall hook call.

**add_hookspecs** *(module_or_class)*

Add new hook specifications defined in the given module_or_class.

Functions are recognized as hook specifications if they have been decorated with a matching Hookspec-Marker.
check_pending()
Verify that all hooks which have not been verified against a hook specification are optional, otherwise raise PluginValidationError.

enable_tracing()
Enable tracing of hook calls.
Returns an undo function which, when called, removes the added tracing.

get_canonical_name(plugin)
Return a canonical name for a plugin object.
Note that a plugin may be registered under a different name specified by the caller of register(plugin, name). To obtain the name of a registered plugin use get_name(plugin) instead.

get_hookcallers(plugin)
Get all hook callers for the specified plugin.
Returns
The hook callers, or None if plugin is not registered in this plugin manager.
Return type
list[HookCaller] | None

get_name(plugin)
Return the name the plugin is registered under, or None if is isn't.

get_plugin(name)
Return the plugin registered under the given name, if any.

get_plugins()
Return a set of all registered plugin objects.

has_plugin(name)
Return whether a plugin with the given name is registered.

is_blocked(name)
Return whether the given plugin name is blocked.

is_registered(plugin)
Return whether the plugin is already registered.
list_name_plugin()
Return a list of (name, plugin) pairs for all registered plugins.

list_plugin_distinfo()
Return a list of (plugin, distinfo) pairs for all setuptools-registered plugins.

load_setuptools_entrypoints(group, name=None)
Load modules from querying the specified setuptools group.

Parameters
• group (str) – Entry point group to load plugins.
• name (str | None) – If given, loads only plugins with the given name.

Returns
The number of plugins loaded by this call.

Return type
int

dset_blocked (name)
Block registrations of the given name, unregister if already registered.

subset_hook_caller(name, remove_plugins)
Return a proxy HookCaller instance for the named method which manages calls to all registered plugins except the ones from remove_plugins.

unblock (name)
Unblocks a name.

Returns whether the name was actually blocked.

unregister(plugin=None, name=None)
Unregister a plugin and all of its hook implementations.

The plugin can be specified either by the plugin object or the plugin name. If both are specified, they must agree.

Returns the unregistered plugin, or None if not found.

project_name: Final
The project name.

hook: Final
The “hook relay”, used to call a hook on all registered plugins. See Calling hooks.

trace: Final[_tracing.TagTracerSub]
The tracing entry point. See Built-in tracing.
final class TestReport
   Bases: BaseReport

Basic test report object (also used for setup and teardown calls if they fail).
Reports can contain arbitrary extra attributes.

   nodeid: str
      Normalized collection nodeid.

   location: tuple[str, int | None, str]
      A (filesystempath, lineno, domaininfo) tuple indicating the actual location of a test item - it might be different
      from the collected one e.g. if a method is inherited from a different module. The filesystempath may be relative
to config.rootdir. The line number is 0-based.

   keywords: Mapping[str, Any]
      A name -> value dictionary containing all keywords and markers associated with a test invocation.

   outcome: Literal['passed', 'failed', 'skipped']
      Test outcome, always one of “passed”, “failed”, “skipped”.

   longrepr: None | ExceptionInfo[BaseException] | tuple[str, int, str] | str | TerminalRepr
      None or a failure representation.

   when: str | None
      One of ‘setup’, ‘call’, ‘teardown’ to indicate runtest phase.

   user_properties
      User properties is a list of tuples (name, value) that holds user defined properties of the test.

   sections: list[tuple[str, str]]
      Tuples of str (heading, content) with extra information for the test report. Used by pytest to add
text captured from stdout, stderr, and intercepted logging events. May be used by other plugins to add
arbitrary information to reports.

   duration: float
      Time it took to run just the test.

   start: float
      The system time when the call started, in seconds since the epoch.

   stop: float
      The system time when the call ended, in seconds since the epoch.

   classmethod from_item_and_call (item, call)
      Create and fill a TestReport with standard item and call info.

         Parameters

         - item (Item) – The item.
         - call (CallInfo[None]) – The call info.
**property caplog**: `str`
Return captured log lines, if log capturing is enabled.
Added in version 3.5.

**property capstderr**: `str`
Return captured text from stderr, if capturing is enabled.
Added in version 3.0.

**property capstdout**: `str`
Return captured text from stdout, if capturing is enabled.
Added in version 3.0.

**property count_towards_summary**: `bool`
Experimental Whether this report should be counted towards the totals shown at the end of the test session: “1 passed, 1 failure, etc”.

**Note**: This function is considered experimental, so beware that it is subject to changes even in patch releases.

**property failed**: `bool`
Whether the outcome is failed.

**property fspath**: `str`
The path portion of the reported node, as a string.

**property head_line**: `str` | `None`
Experimental The head line shown with longrepr output for this report, more commonly during traceback representation during failures:

```
    Test.foo
```

In the example above, the head_line is “Test.foo”.

**Note**: This function is considered experimental, so beware that it is subject to changes even in patch releases.

**property longreprtext**: `str`
Read-only property that returns the full string representation of longrepr.
Added in version 3.0.

**property passed**: `bool`
Whether the outcome is passed.

**property skipped**: `bool`
Whether the outcome is skipped.
TestShortLogReport

**class TestShortLogReport**

Used to store the test status result category, shortletter and verbose word. For example "rerun", "R", ("RERUN", {"yellow": True}).

**Variables**

- **category** - The class of result, for example “passed”, “skipped”, “error”, or the empty string.
- **letter** - The short letter shown as testing progresses, for example ".", "s", "E", or the empty string.
- **word** - Verbose word is shown as testing progresses in verbose mode, for example "PASSED", "SKIPPED", "ERROR", or the empty string.

```python
class TestShortLogReport
    category: str
        Alias for field number 0
    letter: str
        Alias for field number 1
    word: str | tuple[str, Mapping[str, bool]]
        Alias for field number 2
```

**Result**

Result object used within hook wrappers, see Result in the pluggy documentation for more information.

**Stash**

**class Stash**

Stash is a type-safe heterogeneous mutable mapping that allows keys and value types to be defined separately from where it (the Stash) is created.

Usually you will be given an object which has a Stash, for example Config or a Node:

```python
stash: Stash = some_object.stash
```

If a module or plugin wants to store data in this Stash, it creates StashKeys for its keys (at the module level):

```python
# At the top-level of the module
some_str_key = StashKey[str]()
some_bool_key = StashKey[bool]()
```

To store information:

```python
# Value type must match the key.
stash[some_str_key] = "value"
stash[some_bool_key] = True
```

To retrieve the information:
# The static type of some_str is str.
some_str = stash[some_str_key]

# The static type of some_bool is bool.
some_bool = stash[some_bool_key]

Added in version 7.0.

```python
__setitem__(key, value)
    Set a value for key.

__getitem__(key)
    Get the value for key.
    Raises KeyError if the key wasn’t set before.

get(key, default)
    Get the value for key, or return default if the key wasn’t set before.

setdefault(key, default)
    Return the value of key if already set, otherwise set the value of key to default and return default.

__delitem__(key)
    Delete the value for key.
    Raises KeyError if the key wasn’t set before.

__contains__(key)
    Return whether key was set.

__len__()
    Return how many items exist in the stash.
```

## class StashKey

Bases: `Generic[T]`

`StashKey` is an object used as a key to a `Stash`.

A `StashKey` is associated with the type `T` of the value of the key.

A `StashKey` is unique and cannot conflict with another key.

Added in version 7.0.
3.4.8 Global Variables

pytest treats some global variables in a special manner when defined in a test module or `conftest.py` files.

**collect_ignore**

**Tutorial: Customizing test collection**

Can be declared in `conftest.py` files to exclude test directories or modules. Needs to be a list of paths (`str`, `pathlib.Path` or any `os.PathLike`).

```python
collect_ignore = ["setup.py"]
```

**collect_ignore_glob**

**Tutorial: Customizing test collection**

Can be declared in `conftest.py` files to exclude test directories or modules with Unix shell-style wildcards. Needs to be a list of paths (`str`).

```python
collect_ignore_glob = ["*_ignore.py"]
```

**pytest_plugins**

**Tutorial: Requiring/Loading plugins in a test module or conftest file**

Can be declared at the `global` level in `test modules` and `conftest.py` files to register additional plugins. Can be either a `str` or `Sequence[str]`.

```python
pytest_plugins = "myapp.testsupport.myplugin"
```

```python
pytest_plugins = ("myapp.testsupport.tools", "myapp.testsupport.regression")
```

**pytestmark**

**Tutorial: Marking whole classes or modules**

Can be declared at the `global` level in `test modules` to apply one or more `marks` to all test functions and methods. Can be either a single mark or a list of marks (applied in left-to-right order).

```python
import pytest
pytestmark = pytest.mark.webtest
```

```python
import pytest
pytestmark = [pytest.mark.integration, pytest.mark.slow]
```

3.4.9 Environment Variables

Environment variables that can be used to change pytest's behavior.

**CI**

When set (regardless of value), pytest acknowledges that is running in a CI process. Alternative to `BUILD_NUMBER` variable.
When set (regardless of value), pytest acknowledges that it is running in a CI process. Alternative to CI variable.

This contains a command-line (parsed by the `shlex` module) that will be prepended to the command line given by the user, see Built-in configuration file options for more information.

This environment variable is defined at the start of the pytest session and is undefined afterwards. It contains the value of `pytest.__version__`, and among other things can be used to easily check if a code is running from within a pytest run.

This is not meant to be set by users, but is set by pytest internally with the name of the current test so other processes can inspect it, see PYTEST_CURRENT_TEST environment variable for more information.

When set, pytest will print tracing and debug information.

When set, disables plugin auto-loading through entry point packaging metadata. Only explicitly specified plugins will be loaded.

Contains comma-separated list of modules that should be loaded as plugins:

```bash
export PYTEST_PLUGINS=mymodule.plugin,xdist
```

Sets a pygment style to use for the code output.

Sets the PYTEST_THEME to be either dark or light.

When set to 1, pytest will use color in terminal output. When set to 0, pytest will not use color. PYCOLORS takes precedence over NO_COLOR and FORCE_COLOR.

When set to a non-empty string (regardless of value), pytest will not use color in terminal output. PYCOLORS takes precedence over NO_COLOR, which takes precedence over FORCE_COLOR. See no-color.org for other libraries supporting this community standard.

When set to a non-empty string (regardless of value), pytest will use color in terminal output. PYCOLORS and NO_COLOR take precedence over FORCE_COLOR.
3.4.10 Exceptions

**final exception UsageError**
   Bases: Exception
   Error in pytest usage or invocation.

**final exception FixtureLookupError**
   Bases: LookupError
   Could not return a requested fixture (missing or invalid).

3.4.11 Warnings

Custom warnings generated in some situations such as improper usage or deprecated features.

**class PytestWarning**
   Bases: UserWarning
   Base class for all warnings emitted by pytest.

**class PytestAssertRewriteWarning**
   Bases: PytestWarning
   Warning emitted by the pytest assert rewrite module.

**class PytestCacheWarning**
   Bases: PytestWarning
   Warning emitted by the cache plugin in various situations.

**class PytestCollectionWarning**
   Bases: PytestWarning
   Warning emitted when pytest is not able to collect a file or symbol in a module.

**class PytestConfigWarning**
   Bases: PytestWarning
   Warning emitted for configuration issues.

**class PytestDeprecationWarning**
   Bases: PytestWarning, DeprecationWarning
   Warning class for features that will be removed in a future version.

**class PytestExperimentalApiWarning**
   Bases: PytestWarning, FutureWarning
   Warning category used to denote experiments in pytest.
   Use sparingly as the API might change or even be removed completely in a future version.

**class PytestReturnNotNoneWarning**
   Bases: PytestWarning
   Warning emitted when a test function is returning value other than None.
class PytestRemovedIn9Warning
    Bases: PytestDeprecationWarning
    Warning class for features that will be removed in pytest 9.

class PytestUnhandledCoroutineWarning
    Bases: PytestReturnNotNoneWarning
    Warning emitted for an unhandled coroutine.
    A coroutine was encountered when collecting test functions, but was not handled by any async-aware plugin. Coroutine test functions are not natively supported.

class PytestUnknownMarkWarning
    Bases: PytestWarning
    Warning emitted on use of unknown markers.
    See `How to mark test functions with attributes` for details.

class PytestUnraisableExceptionWarning
    Bases: PytestWarning
    An unraisable exception was reported.
    Unraisable exceptions are exceptions raised in `__del__` implementations and similar situations when the exception cannot be raised as normal.

class PytestUnhandledThreadExceptionWarning
    Bases: PytestWarning
    An unhandled exception occurred in a `Thread`.
    Such exceptions don't propagate normally.

Consult the `Internal pytest warnings` section in the documentation for more information.

### 3.4.12 Configuration Options

Here is a list of built-in configuration options that may be written in a `pytest.ini` (or `.pytest.ini`) or `setup.cfg` file, usually located at the root of your repository.

To see each file format in details, see `Configuration file formats`.

**Warning:** Usage of `setup.cfg` is not recommended except for very simple use cases. `.cfg` files use a different parser than `pytest.ini` and `tox.ini` which might cause hard to track down problems. When possible, it is recommended to use the latter files, or `pyproject.toml`, to hold your pytest configuration.

Configuration options may be overwritten in the command-line by using `-o/--override-ini, which can also be passed multiple times. The expected format is `name=value`. For example:

```
pytest -o console_output_style=classic -o cache_dir=/tmp/mycache
```

**addopts**

Add the specified `OPTS` to the set of command line arguments as if they had been specified by the user. Example: if you have this ini file content:
# content of pytest.ini
[pytest]
addopts = --maxfail=2 -rf  # exit after 2 failures, report fail info

issuing pytest test_hello.py actually means:

```
pytest --maxfail=2 -rf test_hello.py
```

Default is to add no options.

cache_dir

Sets a directory where stores content of cache plugin. Default directory is .pytest_cache which is created in rootdir. Directory may be relative or absolute path. If setting relative path, then directory is created relative to rootdir. Additionally path may contain environment variables, that will be expanded. For more information about cache plugin please refer to How to re-run failed tests and maintain state between test runs.

consider_namespace_packages

Controls if pytest should attempt to identify namespace packages when collecting Python modules. Default is False.

Set to True if the package you are testing is part of a namespace package.

Only native namespace packages are supported, with no plans to support legacy namespace packages.

Added in version 8.1.

console_output_style

Sets the console output style while running tests:

- **classic**: classic pytest output.
- **progress**: like classic pytest output, but with a progress indicator.
- **progress-even-when-capture-no**: allows the use of the progress indicator even when capture=no.
- **count**: like progress, but shows progress as the number of tests completed instead of a percent.

The default is **progress**, but you can fallback to **classic** if you prefer or the new mode is causing unexpected problems:

```
# content of pytest.ini
[pytest]
console_output_style = classic
```

doctest_encoding

Default encoding to use to decode text files with docstrings. See how pytest handles doctests.

doctest_optionflags

One or more doctest flag names from the standard doctest module. See how pytest handles doctests.

empty_parameter_set_mark

Allows to pick the action for empty parameters sets in parameterization

- **skip** skips tests with an empty parameterset (default)
- **xfail** marks tests with an empty parameterset as xfail(run=False)
- **fail_at_collect** raises an exception if parametrize collects an empty parameter set
Note: The default value of this option is planned to change to xfail in future releases as this is considered less error prone, see #3155 for more details.

**faulthandler_timeout**

Dumps the tracebacks of all threads if a test takes longer than X seconds to run (including fixture setup and teardown). Implemented using the `faulthandler.dump_traceback_later()` function, so all caveats there apply.

```ini
[pytest]
faulthandler_timeout=5
```

For more information please refer to faulthandler.

**filterwarnings**

Sets a list of filters and actions that should be taken for matched warnings. By default all warnings emitted during the test session will be displayed in a summary at the end of the test session.

```ini
[pytest]
filterwarnings =
    error
    ignore::DeprecationWarning
```

This tells pytest to ignore deprecation warnings and turn all other warnings into errors. For more information please refer to *How to capture warnings*.

**junit_duration_report**

Added in version 4.1.

Configures how durations are recorded into the JUnit XML report:

- **total** (the default): duration times reported include setup, call, and teardown times.
- **call**: duration times reported include only call times, excluding setup and teardown.

```ini
[pytest]
junit_duration_report = call
```

**junit_family**

Added in version 4.2.

Changed in version 6.1: Default changed to xunit2.

Configures the format of the generated JUnit XML file. The possible options are:

- **xunit1** (or legacy): produces old style output, compatible with the xunit 1.0 format.
- **xunit2**: produces xunit 2.0 style output, which should be more compatible with latest Jenkins versions. This is the default.

```ini
[pytest]
junit_family = xunit2
```
junit_logging

Added in version 3.5.

Changed in version 5.4: log, all, out-err options added.

Configures if captured output should be written to the JUnit XML file. Valid values are:

- log: write only logging captured output.
- system-out: write captured stdout contents.
- system-err: write captured stderr contents.
- out-err: write both captured stdout and stderr contents.
- all: write captured logging, stdout and stderr contents.
- no (the default): no captured output is written.

```
[pytest]
junit_logging = system-out
```

junit_log_passing_tests

Added in version 4.6.

If `junit_logging != "no"`, configures if the captured output should be written to the JUnit XML file for passing tests. Default is True.

```
[pytest]
junit_log_passing_tests = False
```

junit_suite_name

To set the name of the root test suite xml item, you can configure the `junit_suite_name` option in your config file:

```
[pytest]
junit_suite_name = my_suite
```

log_auto_indent

Allow selective auto-indentation of multiline log messages.

Supports command line option `--log-auto-indent [value]` and config option `log_auto_indent = [value]` to set the auto-indentation behavior for all logging.

`[value]` can be:

- True or “On” - Dynamically auto-indent multiline log messages
- False or “Off” or 0 - Do not auto-indent multiline log messages (the default behavior)
- [positive integer] - auto-indent multiline log messages by [value] spaces

```
[pytest]
log_auto_indent = False
```

Supports passing kwarg `extra={"auto_indent": [value]}` to calls to `logging.log()` to specify auto-indentation behavior for a specific entry in the log. `extra` kwarg overrides the value specified on the command line or in the config.

log_cli

Enable log display during test run (also known as “live logging”). The default is False.
The `log_cli` configuration option is extended with the following additional settings:

- **log_cli_date_format**
  - A `time.strftime()`-compatible string that will be used when formatting dates for live logging.
  ```
  log_cli_date_format = %Y-%m-%d %H:%M:%S
  ```

- **log_cli_format**
  - A `logging`-compatible string used to format live logging messages.
  ```
  log_cli_format = %(asctime)s %(levelname)s %(message)s
  ```

- **log_cli_level**
  - Sets the minimum log message level that should be captured for live logging. The integer value or the names of the levels can be used.
  ```
  log_cli_level = INFO
  ```

- **log_date_format**
  - A `time.strftime()`-compatible string that will be used when formatting dates for logging capture.
  ```
  log_date_format = %Y-%m-%d %H:%M:%S
  ```

- **log_file**
  - A file name relative to the current working directory where log messages should be written to, in addition to the other logging facilities that are active.
  ```
  log_file = logs/pytest-logs.txt
  ```

- **log_file_date_format**
  - A `time.strftime()`-compatible string that will be used when formatting dates for the logging file.
  ```
  log_file_date_format = %Y-%m-%d %H:%M:%S
  ```

- **log_file_format**
  - A `logging`-compatible string used to format logging messages redirected to the logging file.

For more information, see the `Live Logs` and `How to manage logging` sections.
For more information, see *How to manage logging*.

**log_file_level**
Sets the minimum log message level that should be captured for the logging file. The integer value or the names of the levels can be used.

```ini
[pytest]
log_file_level = INFO
```

For more information, see *How to manage logging*.

**log_format**
Sets a logging-compatible string used to format captured logging messages.

```ini
[pytest]
log_format = %(asctime)s %(levelname)s %(message)s
```

For more information, see *How to manage logging*.

**log_level**
Sets the minimum log message level that should be captured for logging capture. The integer value or the names of the levels can be used.

```ini
[pytest]
log_level = INFO
```

For more information, see *How to manage logging*.

**markers**
When the `--strict-markers` or `--strict` command-line arguments are used, only known markers - defined in code by core pytest or some plugin - are allowed.

You can list additional markers in this setting to add them to the whitelist, in which case you probably want to add `--strict-markers` to `addopts` to avoid future regressions:

```ini
[pytest]
addopts = --strict-markers
markers =
    slow
    serial
```

**Note:** The use of `--strict-markers` is highly preferred. `--strict` was kept for backward compatibility only and may be confusing for others as it only applies to markers and not to other options.

**minversion**
Specifies a minimal pytest version required for running tests.

```ini
# content of pytest.ini
[pytest]
minversion = 3.0  # will fail if we run with pytest-2.8
```
norecursedirs

Set the directory basename patterns to avoid when recursing for test discovery. The individual (fnmatch-style) patterns are applied to the basename of a directory to decide if to recurse into it. Pattern matching characters:

- `*` matches everything
- `?` matches any single character
- `[seq]` matches any character in seq
- `![seq]` matches any char not in seq

Default patterns are '*.egg', '*.tar.gz', '__darcs', '.build', 'CVS', 'dist', 'node_modules', '.venv', '{arch}'. Setting a norecursedirs replaces the default. Here is an example of how to avoid certain directories:

```bash
[pytest]
norecursedirs = .svn _build tmp*
```

This would tell pytest to not look into typical subversion or sphinx-build directories or into any tmp prefixed directory.

Additionally, pytest will attempt to intelligently identify and ignore a virtualenv. Any directory deemed to be the root of a virtual environment will not be considered during test collection unless --collect-in-virtualenv is given. Note also that norecursedirs takes precedence over --collect-in-virtualenv; e.g. if you intend to run tests in a virtualenv with a base directory that matches '.*' you must override norecursedirs in addition to using the --collect-in-virtualenv flag.

python_classes

One or more name prefixes or glob-style patterns determining which classes are considered for test collection. Search for multiple glob patterns by adding a space between patterns. By default, pytest will consider any class prefixed with Test as a test collection. Here is an example of how to collect tests from classes that end in Suite:

```bash
[pytest]
python_classes = *Suite
```

Note that unittest.TestCase derived classes are always collected regardless of this option, as unittest's own collection framework is used to collect those tests.

python_files

One or more Glob-style file patterns determining which python files are considered as test modules. Search for multiple glob patterns by adding a space between patterns:

```bash
[pytest]
python_files = test_*_.py check_*_.py example_*_.py
```

Or one per line:

```bash
[pytest]
python_files =
    test_*_.py
    check_*_.py
    example_*_.py
```

By default, files matching test_*_.py and *_test.py will be considered test modules.

python_functions

One or more name prefixes or glob-patterns determining which test functions and methods are considered tests. Search for multiple glob patterns by adding a space between patterns. By default, pytest will consider any function prefixed with test as a test. Here is an example of how to collect test functions and methods that end in _test:
Note that this has no effect on methods that live on a `unittest.TestCase` derived class, as unittest's own collection framework is used to collect those tests.

See Changing naming conventions for more detailed examples.

**pythonpath**

Sets list of directories that should be added to the python search path. Directories will be added to the head of `sys.path`. Similar to the `PYTHONPATH` environment variable, the directories will be included in where Python will look for imported modules. Paths are relative to the `rootdir` directory. Directories remain in path for the duration of the test session.

```
[pytest]
pythonpath = src1 src2
```

**Note:** `pythonpath` does not affect some imports that happen very early, most notably plugins loaded using the `-p` command line option.

**required_plugins**

A space separated list of plugins that must be present for pytest to run. Plugins can be listed with or without version specifiers directly following their name. Whitespace between different version specifiers is not allowed. If any one of the plugins is not found, emit an error.

```
[pytest]
required_plugins = pytest-django>=3.0.0,<4.0.0 pytest-html pytest-xdist>=1.0.0
```

**testpaths**

Sets list of directories that should be searched for tests when no specific directories, files or test ids are given in the command line when executing pytest from the `rootdir` directory. File system paths may use shell-style wildcards, including the recursive `**` pattern.

Useful when all project tests are in a known location to speed up test collection and to avoid picking up undesired tests by accident.

```
[pytest]
testpaths = testing doc
```

This configuration means that executing:

```
pytest
```

has the same practical effects as executing:

```
pytest testing doc
```

**tmp_path_retention_count**

How many sessions should we keep the `tmp_path` directories, according to `tmp_path_retention_policy`.

```
[pytest]
tmp_path_retention_count = 3
```

Default: 3
**tmp_path_retention_policy**

Controls which directories created by the `tmp_path` fixture are kept around, based on test outcome.

- **all**: retains directories for all tests, regardless of the outcome.
- **failed**: retains directories only for tests with outcome `error` or `failed`.
- **none**: directories are always removed after each test ends, regardless of the outcome.

```
[pytest]
tmp_path_retention_policy = "all"
```

Default: all

**usefixtures**

List of fixtures that will be applied to all test functions; this is semantically the same to apply the `@pytest.mark.usefixtures` marker to all test functions.

```
[pytest]
usefixtures =
    clean_db
```

**verbosity_assertions**

Set a verbosity level specifically for assertion related output, overriding the application wide level.

```
[pytest]
verbosity_assertions = 2
```

Defaults to application wide verbosity level (via the `-v` command-line option). A special value of “auto” can be used to explicitly use the global verbosity level.

**verbosity_test_cases**

Set a verbosity level specifically for test case execution related output, overriding the application wide level.

```
[pytest]
verbosity_test_cases = 2
```

Defaults to application wide verbosity level (via the `-v` command-line option). A special value of “auto” can be used to explicitly use the global verbosity level.

**xfail_strict**

If set to `True`, tests marked with `@pytest.mark.xfail` that actually succeed will by default fail the test suite. For more information, see `strict parameter`.

```
[pytest]
xfail_strict = True
```

### 3.4.13 Command-line Flags

All the command-line flags can be obtained by running `pytest --help`:

```
$ pytest --help
usage: pytest [options] [file_or_dir] [file_or_dir] [...]

positional arguments:
    file_or_dir
```

(continues on next page)
general:

- **k** EXPRESSION Only run tests which match the given substring expression. An expression is a Python evaluable expression where all names are substring-matched against test names and their parent classes. Example: `-k 'test_method or test_other'` matches all test functions and classes whose name contains `test_method` or `test_other`, while `-k 'not test_method'` matches those that don't contain `test_method` in their names. `-k 'not test_method and not test_other'` will eliminate the matches. Additionally keywords are matched to classes and functions containing extra names in their `extra_keyword_matches` set, as well as functions which have names assigned directly to them. The matching is case-insensitive.

- **m** MARKEXPR Only run tests matching given mark expression. For example: `-m 'mark1 and not mark2'`.

- **--markers** show markers (builtin, plugin and per-project ones).

- **-x**, **--exitfirst** Exit instantly on first error or failed test

- **--fixtures**, **--funcargs** Show available fixtures, sorted by plugin appearance (fixtures with leading `_` are only shown with `-v`)

- **--fixtures-per-test** Show fixtures per test

- **--pdb** Start the interactive Python debugger on errors or KeyboardInterrupt

- **--pdbcls=modulename:classname** Specify a custom interactive Python debugger for use with `--pdb`. For example: `--pdbcls=IPython.terminal.debugger:TerminalPdb`

- **--trace** Immediately break when running each test

- **--capture=method** Per-test capturing method: one of `fd|sys|no|tee-sys`

- **-s** Shortcut for `--capture=no`

- **--runxfail** Report the results of xfail tests as if they were not marked

- **--lf**, **--last-failed** Rerun only the tests that failed at the last run (or all if none failed)

- **--ff**, **--failed-first** Run all tests, but run the last failures first. This may re-order tests and thus lead to repeated fixture setup/teardown.

- **--nf**, **--new-first** Run tests from new files first, then the rest of the tests sorted by file mtime

- **--cache-show=[CACHESHOW]** Show cache contents, don't perform collection or tests. Optional argument: `glob` (default: `'*'`).

- **--cache-clear** Remove all cache contents at start of test run

- **--lfnf={all,none}, --last-failed-no-failures={all,none}** With `''--lf''`, determines whether to execute tests when there are no previously (known) failures or when no cached `''lastfailed''` data was found. `''all''` (the default) runs the full test suite again. `''none''` just emits a message about no known failures and exits successfully.

- **--sw**, **--stepwise** Exit on test failure and continue from last failing test next time

- **--sw-skip**, **--stepwise-skip**
Ignore the first failing test but stop on the next failing test. Implicitly enables --stepwise.

Reporting:

- **--durations=N** Show N slowest setup/test durations (N=0 for all)
- **--durations-min=N** Minimal duration in seconds for inclusion in slowest list. Default: 0.005.
- **-v, --verbose** Increase verbosity
- **--no-header** Disable header
- **--no-summary** Disable summary
- **-q, --quiet** Decrease verbosity
- **--verbosity=VERBOSE** Set verbosity. Default: 0.
- **-r chars** Show extra test summary info as specified by chars: (f)ailed, (E)rror, (s)kipped, (x)failed, (X)passed, (p)assed, (P)assed with output, (a)ll except passed (p/P), or (A)ll. (w)arnings are enabled by default (see --disable-warnings), 'N' can be used to reset the list. (default: 'fE').
- **--disable-warnings, --disable-pytest-warnings**
- **-l, --showlocals** Show locals in tracebacks (disabled by default)
- **--no-showlocals** Hide locals in tracebacks (negate --showlocals passed through addopts)
- **--tb=style** Traceback print mode (auto/long/short/line/native/no)
- **--show-capture={no,stdout,stderr,log,all}** Controls how captured stdout/stderr/log is shown on failed tests. Default: all.
- **--full-trace** Don't cut any tracebacks (default is to cut)
- **--color=color** Color terminal output (yes/no/auto)
- **--code-highlight={yes,no}** Whether code should be highlighted (only if --color is also enabled). Default: yes.
- **--pastebin=mode** Send failed/all info to bpaste.net pastebin service
- **--junit-xml=path** Create junit-xml style report file at given path
- **--junit-prefix=str** Prepend prefix to classnames in junit-xml output

**pytest-warnings:**

- **-W PYTHONWARNINGS, --pythonwarnings=PYTHONWARNINGS** Set which warnings to report, see -W option of Python itself
- **--maxfail=num** Exit after first num failures or errors
- **--strict-config** Any warnings encountered while parsing the `pytest` section of the configuration file raise errors
- **--strict-markers** Markers not registered in the 'markers' section of the configuration file raise errors
- **--strict** (Deprecated) alias to --strict-markers
- **-c FILE, --config-file=FILE** Load configuration from 'FILE' instead of trying to locate one of the implicit configuration files.
- **--continue-on-collection-errors** Force test execution even if collection errors occur
- **--rootdir=ROOTDIR** Define root directory for tests. Can be relative path: 'root_dir', './root_dir', 'root_dir/another_dir/'; absolute path: '/home/user/root_dir'; path with variables: '$HOME/root_dir'.
collection:
--collect-only, --co Only collect tests, don’t execute them
--pyargs Try to interpret all arguments as Python packages
--ignore path Ignore path during collection (multi-allowed)
--ignore-glob=path Ignore path pattern during collection (multi-
allowed)
--deselect=nodeid_prefix Deselect item (via node id prefix) during collection
(multi-allowed)
--confcutdir=dir Only load conftest.py’s relative to specified dir
--noconftest Don’t load any conftest.py files
--keep-duplicates Keep duplicate tests
--collect-in-virtualenv Don’t ignore tests in a local virtualenv directory
--import-mode=(prepend, append, importlib) Prepend/append to sys.path when importing test
modules and conftest files. Default: prepend.
--doctest-modules Run doctests in all .py modules
--doctest-report={none, cdiff, ndiff, udiff, only_first_failure} Choose another output format for diffs on doctest failure
--doctest-glob=pat Doctests file matching pattern, default: test*.txt
--doctest-ignore-import-errors Ignore doctest collection errors
--doctest-continue-on-failure For a given doctest, continue to run after the first failure

test session debugging and configuration:
--basetemp=dir Base temporary directory for this test run. (Warning: this directory is removed if it exists.)
-V, --version Display pytest version and information about plugins. When given twice, also display information about plugins.
-h, --help Show help message and configuration info
-p name Early-load given plugin module name or entry point (multi-allowed). To avoid loading of plugins, use the 'no:' prefix, e.g. 'no:doctest'.
--trace-config Trace considerations of conftest.py files
--debug=[DEBUG_FILE_NAME] Store internal tracing debug information in this log file. This file is opened with 'w' and truncated as a result, care advised. Default: pytestdebug.log.
-o OVERRIDE_INI, --override-ini=OVERRIDE_INI Override ini option with "option=value" style, e.g. 'o xfail_strict=True -o cache_dir=cache'.
--assert=MODE Control assertion debugging tools. 'plain' performs no assertion debugging. 'rewrite' (the default) rewrites assert statements in test modules on import to provide assert expression information.
--setup-only Only setup fixtures, do not execute tests
--setup-show Show setup of fixtures while executing tests
--setup-plan Show what fixtures and tests would be executed but don't execute anything
logging:

`--log-level=LEVEL`  Level of messages to catch/display. Not set by default, so it depends on the root/parent log handler's effective level, where it is "WARNING" by default.

`--log-format=LOG_FORMAT`  Log format used by the logging module

`--log-date-format=LOG_DATE_FORMAT`  Log date format used by the logging module

`--log-cli-level=LOG_CLI_LEVEL`  CLI logging level

`--log-cli-format=LOG_CLI_FORMAT`  Log format used by the logging module

`--log-cli-date-format=LOG_CLI_DATE_FORMAT`  Log date format used by the logging module

`--log-file=LOG_FILE`  Path to a file when logging will be written to

`--log-file-mode={w,a}`  Log file open mode

`--log-file-level=LOG_FILE_LEVEL`  Log file logging level

`--log-file-format=LOG_FILE_FORMAT`  Log format used by the logging module

`--log-file-date-format=LOG_FILE_DATE_FORMAT`  Log date format used by the logging module

`--log-auto-indent=LOG_AUTO_INDENT`  Auto-indent multiline messages passed to the logging module. Accepts true|on, false|off or an integer.

`--log-disable=LOGGER_DISABLE`  Disable a logger by name. Can be passed multiple times.

[pystest] ini-options in the first pytest.ini|tox.ini|setup.cfg|pyproject.toml file--found:

markers (linelist):  Register new markers for test functions

empty_parameter_set_mark (string):  Default marker for empty parameters sets

norecursedirs (args):  Directory patterns to avoid for recursion

testpaths (args):  Directories to search for tests when no files or directories are given on the command line

consider_namespace_packages (bool):  Consider namespace packages when resolving module names during import

usefixtures (args):  List of default fixtures to be used with this project

python_files (args):  Glob-style file patterns for Python test module discovery

python_classes (args):  Prefixes or glob names for Python test class discovery

python_functions (args):  Prefixes or glob names for Python test function and method discovery
disable_test_id_escaping_and_forfeit_all_rights_to_community_support (bool):
Disable string escape non-ASCII characters, might cause unwanted side effects (use at your own risk)

c console_output_style (string):
Console output: "classic", or with additional progress information ("progress" (percentage) | "count" | "progress-even-when-capture-no" (forces progress even when capture=no)

verbosity_test_cases (string):
Specify a verbosity level for test case execution, overriding the main level. Higher levels will provide more detailed information about each test case executed.

xfail_strict (bool): Default for the strict parameter of xfail markers when not given explicitly (default: False)

tmp_path_retention_count (string):
How many sessions should we keep the `tmp_path` directories, according to `tmp_path_retention_policy`

tmp_path_retention_policy (string):
Controls which directories created by the `tmp_path` fixture are kept around, based on test outcome. (all/failed/none)

enable_assertion_pass_hook (bool):
Enables the pytest_assertion_pass hook. Make sure to delete any previously generated pyc cache files.

verbosity_assertions (string):
Specify a verbosity level for assertions, overriding the main level. Higher levels will provide more detailed explanation when an assertion fails.

junit_suite_name (string):
Test suite name for JUnit report

junit_logging (string):
Write captured log messages to JUnit report: one of no|log|system-out|system-err|out-err|all

junit_log_passing_tests (bool):
Capture log information for passing tests to JUnit report:

junit_duration_report (string):
Duration time to report: one of total|call

junit_family (string):
Emit XML for schema: one of legacy|xunit1|xunit2

doctest_optionflags (args):
Option flags for doctests

doctest_encoding (string):
Encoding used for doctest files

cache_dir (string):
Cache directory path

log_level (string):
Default value for --log-level

log_format (string):
Default value for --log-format

log_date_format (string):
Default value for --log-date-format

log_cli (bool):
Enable log display during test run (also known as "live logging")

log_cli_level (string):
Default value for --log-cli-level

log_cli_format (string):
Default value for --log-cli-format
log_cli_date_format (string):
    Default value for --log-cli-date-format
log_file (string):
    Default value for --log-file
log_file_mode (string):
    Default value for --log-file-mode
log_file_level (string):
    Default value for --log-file-level
log_file_format (string):
    Default value for --log-file-format
log_file_date_format (string):
    Default value for --log-file-date-format
log_auto_indent (string):
    Default value for --log-auto-indent
pythonpath (paths):
    Add paths to sys.path
faulthandler_timeout (string):
    Dump the traceback of all threads if a test takes
    more than TIMEOUT seconds to finish
addopts (args):
    Extra command line options
minversion (string):
    Minimally required pytest version
required_plugins (args):
    Plugins that must be present for pytest to run

Environment variables:
    PYTEST_ADDOPTS Extra command line options
    PYTEST_PLUGINS Comma-separated plugins to load during startup
    PYTEST_DISABLE_PLUGIN_AUTOLOAD Set to disable plugin auto-loading
    PYTEST_DEBUG Set to enable debug tracing of pytest's internals

to see available markers type: pytest --markers
to see available fixtures type: pytest --fixtures
(shown according to specified file_or_dir or current dir if not specified; fixtures
with leading '_' are only shown with the '-v' option)
4.1 Anatomy of a test

In the simplest terms, a test is meant to look at the result of a particular behavior, and make sure that result aligns with what you would expect. Behavior is not something that can be empirically measured, which is why writing tests can be challenging.

“Behavior” is the way in which some system acts in response to a particular situation and/or stimuli. But exactly how or why something is done is not quite as important as what was done.

You can think of a test as being broken down into four steps:

1. Arrange
2. Act
3. Assert
4. Cleanup

Arrange is where we prepare everything for our test. This means pretty much everything except for the “act”. It’s lining up the dominoes so that the act can do its thing in one, state-changing step. This can mean preparing objects, starting/killing services, entering records into a database, or even things like defining a URL to query, generating some credentials for a user that doesn’t exist yet, or just waiting for some process to finish.

Act is the singular, state-changing action that kicks off the behavior we want to test. This behavior is what carries out the changing of the state of the system under test (SUT), and it’s the resulting changed state that we can look at to make a judgement about the behavior. This typically takes the form of a function/method call.

Assert is where we look at that resulting state and check if it looks how we’d expect after the dust has settled. It’s where we gather evidence to say the behavior does or does not align with what we expect. The assert in our test is where we take that measurement/observation and apply our judgement to it. If something should be green, we’d say assert thing == "green".

Cleanup is where the test picks up after itself, so other tests aren’t being accidentally influenced by it.

At its core, the test is ultimately the act and assert steps, with the arrange step only providing the context. Behavior exists between act and assert.
4.2 About fixtures

See also:

*How to use fixtures*

See also:

*Fixtures reference*

pytest fixtures are designed to be explicit, modular and scalable.

4.2.1 What fixtures are

In testing, a fixture provides a defined, reliable and consistent context for the tests. This could include environment (for example a database configured with known parameters) or content (such as a dataset).

Fixtures define the steps and data that constitute the *arrange* phase of a test (see *Anatomy of a test*). In pytest, they are functions you define that serve this purpose. They can also be used to define a test's *act* phase; this is a powerful technique for designing more complex tests.

The services, state, or other operating environments set up by fixtures are accessed by test functions through arguments. For each fixture used by a test function there is typically a parameter (named after the fixture) in the test function's definition.

We can tell pytest that a particular function is a fixture by decorating it with `@pytest.fixture`. Here's a simple example of what a fixture in pytest might look like:

```python
import pytest

class Fruit:
    def __init__(self, name):
        self.name = name

    def __eq__(self, other):
        return self.name == other.name

@pytest.fixture
def my_fruit():
    return Fruit("apple")

@pytest.fixture
def fruit_basket(my_fruit):
    return [Fruit("banana"), my_fruit]

def test_my_fruit_in_basket(my_fruit, fruit_basket):
    assert my_fruit in fruit_basket
```

Tests don't have to be limited to a single fixture, either. They can depend on as many fixtures as you want, and fixtures can use other fixtures, as well. This is where pytest's fixture system really shines.
4.2.2 Improvements over xUnit-style setup/teardown functions

pytest fixtures offer dramatic improvements over the classic xUnit style of setup/teardown functions:

- fixtures have explicit names and are activated by declaring their use from test functions, modules, classes or whole projects.
- fixtures are implemented in a modular manner, as each fixture name triggers a fixture function which can itself use other fixtures.
- fixture management scales from simple unit to complex functional testing, allowing to parametrize fixtures and tests according to configuration and component options, or to re-use fixtures across function, class, module or whole test session scopes.
- teardown logic can be easily, and safely managed, no matter how many fixtures are used, without the need to carefully handle errors by hand or micromanage the order that cleanup steps are added.

In addition, pytest continues to support How to implement xunit-style set-up. You can mix both styles, moving incrementally from classic to new style, as you prefer. You can also start out from existing unittest.TestCase style.

4.2.3 Fixture errors

pytest does its best to put all the fixtures for a given test in a linear order so that it can see which fixture happens first, second, third, and so on. If an earlier fixture has a problem, though, and raises an exception, pytest will stop executing fixtures for that test and mark the test as having an error.

When a test is marked as having an error, it doesn’t mean the test failed, though. It just means the test couldn’t even be attempted because one of the things it depends on had a problem.

This is one reason why it’s a good idea to cut out as many unnecessary dependencies as possible for a given test. That way a problem in something unrelated isn’t causing us to have an incomplete picture of what may or may not have issues.

Here’s a quick example to help explain:

```python
import pytest

@pytest.fixture
def order():
    return []

@pytest.fixture
def append_first(order):
    order.append(1)

@pytest.fixture
def append_second(order, append_first):
    order.extend([2])

@pytest.fixture(autouse=True)
def append_third(order, append_second):
    order += [3]

def test_order(order):
    assert order == [1, 2, 3]
```
If, for whatever reason, `order.append(1)` had a bug and it raises an exception, we wouldn't be able to know if `order.extend([2])` or `order += [3]` would also have problems. After `append_first` throws an exception, pytest won't run any more fixtures for `test_order`, and it won't even try to run `test_order` itself. The only things that would've run would be `order` and `append_first`.

### 4.2.4 Sharing test data

If you want to make test data from files available to your tests, a good way to do this is by loading these data in a fixture for use by your tests. This makes use of the automatic caching mechanisms of pytest.

Another good approach is by adding the data files in the `tests` folder. There are also community plugins available to help to manage this aspect of testing, e.g. `pytest-datadir` and `pytest-datafiles`.

### 4.2.5 A note about fixture cleanup

pytest does not do any special processing for `SIGTERM` and `SIGQUIT` signals (`SIGINT` is handled naturally by the Python runtime via `KeyboardInterrupt`), so fixtures that manage external resources which are important to be cleared when the Python process is terminated (by those signals) might leak resources.

The reason pytest does not handle those signals to perform fixture cleanup is that signal handlers are global, and changing them might interfere with the code under execution.

If fixtures in your suite need special care regarding termination in those scenarios, see this comment in the issue tracker for a possible workaround.

### 4.3 Good Integration Practices

#### 4.3.1 Install package with pip

For development, we recommend you use `venv` for virtual environments and `pip` for installing your application and any dependencies, as well as the `pytest` package itself. This ensures your code and dependencies are isolated from your system Python installation.

Create a `pyproject.toml` file in the root of your repository as described in `Packaging Python Projects`. The first few lines should look like this:

```toml
[build-system]
requires = ["hatchling"]
build-backend = "hatchling.build"

[project]
name = "PACKAGENAME"
version = "PACKAGEVERSION"
```

where `PACKAGENAME` and `PACKAGEVERSION` are the name and version of your package respectively.

You can then install your package in “editable” mode by running from the same directory:

```bash
pip install -e .
```

which lets you change your source code (both tests and application) and rerun tests at will.
4.3.2 Conventions for Python test discovery

`pytest` implements the following standard test discovery:

- If no arguments are specified then collection starts from `testpaths` (if configured) or the current directory. Alternatively, command line arguments can be used in any combination of directories, file names or node ids.
- Recurse into directories, unless they match `norecursedirs`.
- In those directories, search for `test_*` or `*_test` files, imported by their `test package name`.
- From those files, collect test items:
  - `test` prefixed test functions or methods outside of class.
  - `test` prefixed test functions or methods inside `Test` prefixed test classes (without an `__init__` method). Methods decorated with `@staticmethod` and `@classmethod` are also considered.

For examples of how to customize your test discovery [Changing standard (Python) test discovery](#).

Within Python modules, `pytest` also discovers tests using the standard `unittest.TestCase` subclassing technique.

4.3.3 Choosing a test layout

`pytest` supports two common test layouts:

Tests outside application code

Putting tests into an extra directory outside your actual application code might be useful if you have many functional tests or for other reasons want to keep tests separate from actual application code (often a good idea):

```
[tool.pytest.ini_options]
addopts = 
   "--import-mode=importlib",
```

This has the following benefits:

- Your tests can run against an installed version after executing `pip install ..`
- Your tests can run against the local copy with an editable install after executing `pip install --editable ..`

For new projects, we recommend to use `importlib import mode` (see `which-import-mode` for a detailed explanation). To this end, add the following to your `pyproject.toml`:

```
[tool.pytest.ini_options]
addopts = 
   "--import-mode=importlib",
```
Generally, but especially if you use the default import mode `prepend`, it is strongly suggested to use a `src` layout. Here, your application root package resides in a sub-directory of your root, i.e. `src/mypkg/` instead of `mypkg`. This layout prevents a lot of common pitfalls and has many benefits, which are better explained in this excellent blog post by Ionel Cristian Mărieș.

**Note:** If you do not use an editable install and use the `src` layout as above you need to extend the Python's search path for module files to execute the tests against the local copy directly. You can do it in an ad-hoc manner by setting the `PYTHONPATH` environment variable:

```
PYTHONPATH=src pytest
```

or in a permanent manner by using the `pythonpath` configuration variable and adding the following to your `pyproject.toml`:

```
[tool.pytest.ini_options]
pythonpath = "src"
```

**Note:** If you do not use an editable install and not use the `src` layout (`mypkg` directly in the root directory) you can rely on the fact that Python by default puts the current directory in `sys.path` to import your package and run `python -m pytest` to execute the tests against the local copy directly. See Invoking pytest versus python -m pytest for more information about the difference between calling `pytest` and `python -m pytest`.

### Tests as part of application code

Inlining test directories into your application package is useful if you have direct relation between tests and application modules and want to distribute them along with your application:

```
pyproject.toml
[src/]
mypkg/
  __init__.py
  app.py
  view.py
  tests/
    __init__.py
    test_app.py
    test_view.py
    ...
```

In this scheme, it is easy to run your tests using the `--pyargs` option:

```
pytest --pyargs mypkg
```

`pytest` will discover where `mypkg` is installed and collect tests from there.

Note that this layout also works in conjunction with the `src` layout mentioned in the previous section.

**Note:** You can use namespace packages (PEP420) for your application but pytest will still perform `test package name` discovery based on the presence of `__init__.py` files. If you use one of the two recommended file system layouts
above but leave away the __init__.py files from your directories, it should just work. From “inlined tests”, however, you will need to use absolute imports for getting at your application code.

Note: In prepend and append import-modes, if pytest finds a "a/b/test_module.py" test file while recursing into the filesystem it determines the import name as follows:

- determine basedir: this is the first “upward” (towards the root) directory not containing an __init__.py. If e.g. both a and b contain an __init__.py file then the parent directory of a will become the basedir.
- perform sys.path.insert(0, basedir) to make the test module importable under the fully qualified import name.
- import a.b.test_module where the path is determined by converting path separators / into “.” characters.
This means you must follow the convention of having directory and file names map directly to the import names.

The reason for this somewhat evolved importing technique is that in larger projects multiple test modules might import from each other and thus deriving a canonical import name helps to avoid surprises such as a test module getting imported twice.

With --import-mode=importlib things are less convoluted because pytest doesn’t need to change sys.path or sys.modules, making things much less surprising.

Choosing an import mode

For historical reasons, pytest defaults to the prepend import mode instead of the importlib import mode we recommend for new projects. The reason lies in the way the prepend mode works:

Since there are no packages to derive a full package name from, pytest will import your test files as top-level modules. The test files in the first example (src layout) would be imported as test_app and test_view top-level modules by adding tests/ to sys.path.

This results in a drawback compared to the import mode importlib: your test files must have unique names.

If you need to have test modules with the same name, as a workaround you might add __init__.py files to your tests folder and subfolders, changing them to packages:

```toml
pyproject.toml
mypkg/
...tests/
  __init__.py
  foo/
    __init__.py
test_view.py
  bar/
    __init__.py
test_view.py
```

Now pytest will load the modules as tests.foo.test_view and tests.bar.test_view, allowing you to have modules with the same name. But now this introduces a subtle problem: in order to load the test modules from the tests directory, pytest prepends the root of the repository to sys.path, which adds the side-effect that now mypkg is also importable.

This is problematic if you are using a tool like tox to test your package in a virtual environment, because you want to test the installed version of your package, not the local code from the repository.

4.3. Good Integration Practices
The `importlib` import mode does not have any of the drawbacks above, because `sys.path` is not changed when importing test modules.

### 4.3.4 tox

Once you are done with your work and want to make sure that your actual package passes all tests you may want to look into tox, the virtualenv test automation tool. tox helps you to setup virtualenv environments with pre-defined dependencies and then executing a pre-configured test command with options. It will run tests against the installed package and not against your source code checkout, helping to detect packaging glitches.

### 4.3.5 Do not run via setuptools

Integration with setuptools is not recommended, i.e. you should not be using `python setup.py test` or `pytest-runner`, and may stop working in the future.

This is deprecated since it depends on deprecated features of setuptools and relies on features that break security mechanisms in pip. For example ‘setup_requires’ and ‘tests_require’ bypass `pip --require-hashes`. For more information and migration instructions, see the pytest-runner notice. See also pypa/setuptools#1684.

setuptools intends to remove the test command.

### 4.3.6 Checking with flake8-pytest-style

In order to ensure that pytest is being used correctly in your project, it can be helpful to use the flake8-pytest-style flake8 plugin.

flake8-pytest-style checks for common mistakes and coding style violations in pytest code, such as incorrect use of fixtures, test function names, and markers. By using this plugin, you can catch these errors early in the development process and ensure that your pytest code is consistent and easy to maintain.

A list of the lints detected by flake8-pytest-style can be found on its PyPI page.

**Note:** flake8-pytest-style is not an official pytest project. Some of the rules enforce certain style choices, such as using `@pytest.fixture()` over `@pytest.fixture`, but you can configure the plugin to fit your preferred style.

### 4.4 Flaky tests

A “flaky” test is one that exhibits intermittent or sporadic failure, that seems to have non-deterministic behaviour. Sometimes it passes, sometimes it fails, and it’s not clear why. This page discusses pytest features that can help and other general strategies for identifying, fixing or mitigating them.
4.4.1 Why flaky tests are a problem

Flaky tests are particularly troublesome when a continuous integration (CI) server is being used, so that all tests must pass before a new code change can be merged. If the test result is not a reliable signal – that a test failure means the code change broke the test – developers can become mistrustful of the test results, which can lead to overlooking genuine failures. It is also a source of wasted time as developers must re-run test suites and investigate spurious failures.

4.4.2 Potential root causes

System state

Broadly speaking, a flaky test indicates that the test relies on some system state that is not being appropriately controlled - the test environment is not sufficiently isolated. Higher level tests are more likely to be flaky as they rely on more state. Flaky tests sometimes appear when a test suite is run in parallel (such as use of `pytest-xdist`). This can indicate a test is reliant on test ordering.

- Perhaps a different test is failing to clean up after itself and leaving behind data which causes the flaky test to fail.
- The flaky test is reliant on data from a previous test that doesn't clean up after itself, and in parallel runs that previous test is not always present
- Tests that modify global state typically cannot be run in parallel.

Overly strict assertion

Overly strict assertions can cause problems with floating point comparison as well as timing issues. `pytest.approx()` is useful here.

Thread safety

pytest is single-threaded, executing its tests always in the same thread, sequentially, never spawning any threads itself. Even in case of plugins which run tests in parallel, for example `pytest-xdist`, usually work by spawning multiple processes and running tests in batches, without using multiple threads.

It is of course possible (and common) for tests and fixtures to spawn threads themselves as part of their testing workflow (for example, a fixture that starts a server thread in the background, or a test which executes production code that spawns threads), but some care must be taken:

- Make sure to eventually wait on any spawned threads – for example at the end of a test, or during the teardown of a fixture.
- Avoid using primitives provided by pytest (`pytest.warns()`, `pytest.raises()`, etc) from multiple threads, as they are not thread-safe.

If your test suite uses threads and you are seeing flaky test results, do not discount the possibility that the test is implicitly using global state in pytest itself.
4.4.3 Related features

Xfail strict

`pytest.mark.xfail` with `strict=False` can be used to mark a test so that its failure does not cause the whole build to break. This could be considered like a manual quarantine, and is rather dangerous to use permanently.

`PYTEST_CURRENT_TEST`

`PYTEST_CURRENT_TEST` may be useful for figuring out “which test got stuck”. See `PYTEST_CURRENT_TEST` environment variable for more details.

Plugins

Rerunning any failed tests can mitigate the negative effects of flaky tests by giving them additional chances to pass, so that the overall build does not fail. Several pytest plugins support this:

- `pytest-rerunfailures`
- `pytest-replay`: This plugin helps to reproduce locally crashes or flaky tests observed during CI runs.
- `pytest-flakefinder` - blog post

Plugins to deliberately randomize tests can help expose tests with state problems:

- `pytest-random-order`
- `pytest-randomly`

4.4.4 Other general strategies

Split up test suites

It can be common to split a single test suite into two, such as unit vs integration, and only use the unit test suite as a CI gate. This also helps keep build times manageable as high level tests tend to be slower. However, it means it does become possible for code that breaks the build to be merged, so extra vigilance is needed for monitoring the integration test results.

Video/screenshot on failure

For UI tests these are important for understanding what the state of the UI was when the test failed. pytest-splinter can be used with plugins like pytest-bdd and can save a screenshot on test failure, which can help to isolate the cause.
Delete or rewrite the test

If the functionality is covered by other tests, perhaps the test can be removed. If not, perhaps it can be rewritten at a lower level which will remove the flakiness or make its source more apparent.

Quarantine

Mark Lapierre discusses the Pros and Cons of Quarantined Tests in a post from 2018.

CI tools that rerun on failure

Azure Pipelines (the Azure cloud CI/CD tool, formerly Visual Studio Team Services or VSTS) has a feature to identify flaky tests and rerun failed tests.

4.4. Flaky tests
4.5 pytest import mechanisms and sys.path/PYTHONPATH

4.5.1 Import modes

pytest as a testing framework that needs to import test modules and conftest.py files for execution.

Importing files in Python is a non-trivial process, so aspects of the import process can be controlled through the --import-mode command-line flag, which can assume these values:

- **prepend** (default): The directory path containing each module will be inserted into the beginning of sys.path if not already there, and then imported with the importlib.import_module function.

  It is highly recommended to arrange your test modules as packages by adding __init__.py files to your directories containing tests. This will make the tests part of a proper Python package, allowing pytest to resolve their full name (for example tests.core.test_core for test_core.py inside the tests.core package).

  If the test directory tree is not arranged as packages, then each test file needs to have a unique name compared to the other test files, otherwise pytest will raise an error if it finds two tests with the same name.

  This is the classic mechanism, dating back from the time Python 2 was still supported.

- **append**: the directory containing each module is appended to the end of sys.path if not already there, and imported with importlib.import_module.

  This better allows users to run test modules against installed versions of a package even if the package under test has the same import root. For example:

  ```
  testing/__init__.py
  testing/test_pkg_under_test.py
  pkg_under_test/
  ```

  the tests will run against the installed version of pkg_under_test when --import-mode=append is used whereas with prepend, they would pick up the local version. This kind of confusion is why we advocate for using src-layouts.

  Same as prepend, requires test module names to be unique when the test directory tree is not arranged in packages, because the modules will put in sys.modules after importing.

- **importlib**: this mode uses more fine control mechanisms provided by importlib to import test modules, without changing sys.path.

  Advantages of this mode:

  - pytest will not change sys.path at all.
  - Test module names do not need to be unique – pytest will generate a unique name automatically based on the rootdir.

  Disadvantages:

  - Test modules can’t import each other.
  - Testing utility modules in the tests directories (for example a tests.helpers module containing test-related functions/classes) are not importable. The recommendation in this case it to place testing utility modules together with the application/library code, for example app.testing.helpers.

    Important: by “test utility modules”, we mean functions/classes which are imported by other tests directly; this does not include fixtures, which should be placed in conftest.py files, along with the test modules, and are discovered automatically by pytest.

It works like this:
1. Given a certain module path, for example `tests/core/test_models.py`, derives a canonical name like `tests.core.test_models` and tries to import it.

   For non-test modules, this will work if they are accessible via `sys.path`. So for example, `.env/lib/site-packages/app/core.py` will be importable as `app.core`. This is happens when plugins import non-test modules (for example doctesting).

   If this step succeeds, the module is returned.

   For test modules, unless they are reachable from `sys.path`, this step will fail.

2. If the previous step fails, we import the module directly using `importlib` facilities, which lets us import it without changing `sys.path`.

   Because Python requires the module to also be available in `sys.modules`, pytest derives a unique name for it based on its relative location from the `rootdir`, and adds the module to `sys.modules`.

   For example, `tests/core/test_models.py` will end up being imported as the module `tests.core.test_models`.

   Added in version 6.0.

---

**Note:** Initially we intended to make `importlib` the default in future releases, however it is clear now that it has its own set of drawbacks so the default will remain `prepend` for the foreseeable future.

---

**Note:** By default, pytest will not attempt to resolve namespace packages automatically, but that can be changed via the `consider_namespace_packages` configuration variable.

---

**See also:**

The `pythonpath` configuration variable.

The `consider_namespace_packages` configuration variable.

*Choosing a test layout.*

### 4.5.2 `prepend` and `append` import modes scenarios

Here’s a list of scenarios when using `prepend` or `append` import modes where pytest needs to change `sys.path` in order to import test modules or `conftest.py` files, and the issues users might encounter because of that.

**Test modules / `conftest.py` files inside packages**

Consider this file and directory layout:

```
root/
|-- foo/
|   |-- __init__.py
|   |-- conftest.py
|   |-- bar/
|       |-- __init__.py
|       |-- tests/
|             |-- __init__.py
|             |-- test_foo.py
```

When executing:
pytest will find `foo/bar/tests/test_foo.py` and realize it is part of a package given that there's an `__init__.py` file in the same folder. It will then search upwards until it can find the last folder which still contains an `__init__.py` file in order to find the package `root` (in this case `foo/`). To load the module, it will insert `root/` to the front of `sys.path` (if not there already) in order to load `test_foo.py` as the module `foo.bar.tests.test_foo`.

The same logic applies to the `conftest.py` file: it will be imported as `foo.conftest` module.

Preserving the full package name is important when tests live in a package to avoid problems and allow test modules to have duplicated names. This is also discussed in details in *Conventions for Python test discovery*.

### Standalone test modules / `conftest.py` files

Consider this file and directory layout:

```
root/
  |- foo/
    |- conftest.py
  |- bar/
      |- tests/
      |- test_foo.py
```

When executing:

```
pytest root/
```

pytest will find `foo/bar/tests/test_foo.py` and realize it is NOT part of a package given that there's no `__init__.py` file in the same folder. It will then add `root/foo/bar/tests` to `sys.path` in order to import `test_foo.py` as the module `test_foo`. The same is done with the `conftest.py` file by adding `root/foo` to `sys.path` to import it as `conftest`.

For this reason this layout cannot have test modules with the same name, as they all will be imported in the global import namespace.

This is also discussed in details in *Conventions for Python test discovery*.

### 4.5.3 Invoking `pytest` versus `python -m pytest`

Running `pytest` with `pytest [...]` instead of `python -m pytest [...]` yields nearly equivalent behaviour, except that the latter will add the current directory to `sys.path`, which is standard `python` behavior.

See also *Calling pytest through python -m pytest*. 
5.1 Examples and customization tricks

Here is a (growing) list of examples. Contact us if you need more examples or have questions. Also take a look at the comprehensive documentation which contains many example snippets as well. Also, pytest on stackoverflow.com often comes with example answers.

For basic examples, see

- Get Started for basic introductory examples
- How to write and report assertions in tests for basic assertion examples
- Fixtures for basic fixture/setup examples
- How to parametrize fixtures and test functions for basic test function parametrization
- How to use unittest-based tests with pytest for basic unittest integration

The following examples aim at various use cases you might encounter.

5.1.1 Demo of Python failure reports with pytest

Here is a nice run of several failures and how pytest presents things:

```
assertion $ pytest failure_demo.py
================================================ test session starts ===============
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project/assertion

5.1.2 Basic patterns and examples

How to change command line options defaults

It can be tedious to type the same series of command line options every time you use pytest. For example, if you always want to see detailed info on skipped and xfailed tests, as well as have terser “dot” progress output, you can write it into a configuration file:

```ini
# content of pytest.ini
[pytest]
addopts = -ra -q
```

Alternatively, you can set a PYTEST_ADDOPTS environment variable to add command line options while the environment is in use:

```bash
export PYTEST_ADDOPTS="-v"
```

Here's how the command-line is built in the presence of addopts or the environment variable:

```bash
<pytest.ini:addopts> $PYTEST_ADDOPTS <extra command-line arguments>
```

So if the user executes in the command-line:
The actual command line executed is:

```
pytest -ra -q -v -m slow
```

Note that as usual for other command-line applications, in case of conflicting options the last one wins, so the example above will show verbose output because `-v` overwrites `-q`.

**Pass different values to a test function, depending on command line options**

Suppose we want to write a test that depends on a command line option. Here is a basic pattern to achieve this:

```python
# content of test_sample.py

def test_answer(cmdopt):
    if cmdopt == "type1":
        print("first")
    elif cmdopt == "type2":
        print("second")
    assert 0  # to see what was printed
```

For this to work we need to add a command line option and provide the `cmdopt` through a fixture function:

```python
# content of conftest.py

import pytest

def pytest_addoption(parser):
    parser.addoption("--cmdopt", action="store", default="type1", help="my option: type1 or type2")

@ pytest.fixture
def cmdopt(request):
    return request.config.getoption("--cmdopt")
```

Let's run this without supplying our new option:

```
$ pytest -q test_sample.py
F [100%]
_______________________________ test_answer ________________________________
cmdopt = 'type1'

    def test_answer(cmdopt):
        if cmdopt == "type1":
            print("first")
        elif cmdopt == "type2":
            print("second")
    > assert 0  # to see what was printed
E    assert 0
```

5.1. Examples and customization tricks
And now with supplying a command line option:

```bash
$ pytest -q --cmdopt=type2
F [100%]
======================================================================
Test Failed. 1 of 1 in test_answer

cmdopt = 'type2'

def test_answer(cmdopt):
    if cmdopt == "type1":
        print("first")
    elif cmdopt == "type2":
        print("second")
> assert 0  # to see what was printed
E assert 0

test_sample.py:6: AssertionError
```

You can see that the command line option arrived in our test.

We could add simple validation for the input by listing the choices:

```python
# content of conftest.py
import pytest

def pytest_addoption(parser):
    parser.addoption("--cmdopt",
                    action="store",
                    default="type1",
                    help="my option: type1 or type2",
                    choices=('type1', 'type2'),
                    )
```

Now we'll get feedback on a bad argument:

```bash
$ pytest -q --cmdopt=type3
ERROR: usage: pytest [options] [file_or_dir] [file_or_dir] [...]
pytest: error: argument --cmdopt: invalid choice: 'type3' (choose from 'type1', 'type2')
```

If you need to provide more detailed error messages, you can use the type parameter and raise `pytest.UsageError`:

```python
# content of conftest.py
import pytest

def pytest_addoption(parser):
    parser.addoption("--cmdopt",
                    action="store",
                    default="type1",
                    help="my option: type1 or type2",
                    choices=('type1', 'type2'),
                    )
```

(continues on next page)
def type_checker(value):
    msg = "cmdopt must specify a numeric type as typeNNN"
    if not value.startswith("type"):
        raise pytest.UsageError(msg)
    try:
        int(value[4:])
    except ValueError:
        raise pytest.UsageError(msg)
    return value

def pytest_addoption(parser):
    parser.addoption("--cmdopt",
                    action="store",
                    default="type1",
                    help="my option: type1 or type2",
                    type=type_checker,
    )

This completes the basic pattern. However, one often rather wants to process command line options outside of the test and rather pass in different or more complex objects.

Dynamically adding command line options

Through addopts you can statically add command line options for your project. You can also dynamically modify the command line arguments before they get processed:

# installable external plugin
import sys

def pytest_load_initial_conftests(args):
    if "xdist" in sys.modules:  # pytest-xdist plugin
        import multiprocessing
        num = max(multiprocessing.cpu_count() / 2, 1)
        args[:] = ["-n", str(num)] + args

If you have the xdist plugin installed you will now always perform test runs using a number of subprocesses close to your CPU. Running in an empty directory with the above conftest.py:

$ pytest
============== test session starts ===============
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 0 items

============== no tests ran in 0.12s ===============
Control skipping of tests according to command line option

Here is a conftest.py file adding a --runslow command line option to control skipping of pytest.mark.slow marked tests:

```python
# content of conftest.py
import pytest

def pytest_addoption(parser):
    parser.addoption(
        "--runslow", action="store_true", default=False, help="run slow tests"
    )

def pytest_configure(config):
    config.addinivalue_line("markers", "slow: mark test as slow to run")

def pytest_collection_modifyitems(config, items):
    if config.getoption("--runslow"):
        # --runslow given in cli: do not skip slow tests
        return
    skip_slow = pytest.mark.skip(reason="need --runslow option to run")
    for item in items:
        if "slow" in item.keywords:
            item.add_marker(skip_slow)
```

We can now write a test module like this:

```python
# content of test_module.py
import pytest

def test_func_fast():
    pass

@pytest.mark.slow
def test_func_slow():
    pass
```

and when running it will see a skipped “slow” test:

```
$ pytest -rs  # "-rs" means report details on the little 's'
================================================ test session starts ===============
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items

test_module.py .s [100%]

================================ short test summary info =============================
SKIPPED [1] test_module.py:8: need --runslow option to run

1 passed, 1 skipped in 0.12s
```

Or run it including the slow marked test:

```
```

Orrunitincludingtheslow
markedtest:
Writing well integrated assertion helpers

If you have a test helper function called from a test you can use the `pytest.fail` marker to fail a test with a certain message. The test support function will not show up in the traceback if you set the `__tracebackhide__` option somewhere in the helper function. Example:

```python
# content of test_checkconfig.py
import pytest

def checkconfig(x):
    __tracebackhide__ = True
    if not hasattr(x, "config"):
        pytest.fail(f"not configured: {x}"

def test_something():
    checkconfig(42)
```

The `__tracebackhide__` setting influences pytest showing of backtraces: the checkconfig function will not be shown unless the `--full-trace` command line option is specified. Let's run our little function:

```bash
$ pytest -q test_checkconfig.py
F [100%]
------------------------ FAILURES ------------------------
____________________ test_something ________________
> checkconfig(42)
E Failed: not configured: 42
```

If you only want to hide certain exceptions, you can set `__tracebackhide__` to a callable which gets the `ExceptionInfo` object. You can for example use this to make sure unexpected exception types aren't hidden:

```python
import operator

class ConfigException(Exception):
```

(continues on next page)
pass

```python
def checkconfig(x):
    __tracebackhide__ = operator.methodcaller("errisinstance", ConfigException)
    if not hasattr(x, "config"):
        raise ConfigException(f"not configured: {x}")

def test_something():
    checkconfig(42)
```

This will avoid hiding the exception traceback on unrelated exceptions (i.e. bugs in assertion helpers).

### Detect if running from within a pytest run

Usually it is a bad idea to make application code behave differently if called from a test. But if you absolutely must find out if your application code is running from a test you can do this:

```python
import os

if os.environ.get("PYTEST_VERSION") is not None:
    # Things you want to to do if your code is called by pytest.
    ...
else:
    # Things you want to to do if your code is not called by pytest.
    ...
```

### Adding info to test report header

It’s easy to present extra information in a pytest run:

```python
# content of conftest.py

def pytest_report_header(config):
    return "project deps: mylib-1.1"
```

which will add the string to the test header accordingly:

```
$ pytest
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
project deps: mylib-1.1
rootdir: /home/sweet/project
collected 0 items

========================== no tests ran in 0.12s ===========================
```

It is also possible to return a list of strings which will be considered as several lines of information. You may consider `config.getoption('verbose')` in order to display more information if applicable:
# content of conftest.py

def pytest_report_header(config):
    if config.getoption("verbose") > 0:
        return ["info1: did you know that ...", "did you?"]

which will add info only when run with “-v”:

$ pytest -v
===================================================================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
->python
cachedir: .pytest_cache
info1: did you know that ... 
did you?
rootdir: /home/sweet/project
collecting ... collected 0 items
=================================================================== no tests ran in 0.12s ============

and nothing when run plainly:

$ pytest
===================================================================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 0 items
=================================================================== no tests ran in 0.12s ============

Profiling test duration

If you have a slow running large test suite you might want to find out which tests are the slowest. Let’s make an artificial test suite:

# content of test_some_are_slow.py
import time

def test_funcfast():
    time.sleep(0.1)

def test_funcslow1():
    time.sleep(0.2)

def test_funcslow2():
    time.sleep(0.3)

Now we can profile which test functions execute the slowest:

$ pytest --durations=3
===================================================================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
(continues on next page)
Incremental testing - test steps

Sometimes you may have a testing situation which consists of a series of test steps. If one step fails it makes no sense to execute further steps as they are all expected to fail anyway and their tracebacks add no insight. Here is a simple conftest.py file which introduces an incremental marker which is to be used on classes:

```python
# content of conftest.py

from typing import Dict, Tuple
import pytest

# store history of failures per test class name and per index in parametrize (if parametrize used)
_test_failed_incremental: Dict[str, Dict[Tuple[int, ...], str]] = {}

def pytest_runtest_makereport(item, call):
    if "incremental" in item.keywords:
        # incremental marker is used
        if call.excinfo is not None:
            # the test has failed
            # retrieve the class name of the test
            cls_name = str(item.cls)
            # retrieve the index of the test (if parametrize is used in combination)
            # with incremental)
            parametrize_index = (tuple(item.callspec.indices.values())
                if hasattr(item, "callspec")
                else ()
            )
            # retrieve the name of the test function
            test_name = item.originalname or item.name
            # store in _test_failed_incremental the original name of the failed test
            _test_failed_incremental.setdefault(cls_name, {}).setdefault(parametrize_index, test_name)

def pytest_runtest_setup(item):
    if "incremental" in item.keywords:
        # retrieve the class name of the test
        cls_name = str(item.cls)
        # check if a previous test has failed for this class
```

(continues on next page)
These two hook implementations work together to abort incremental-marked tests in a class. Here is a test module example:

```python
# content of test_step.py

import pytest

@pytest.mark.incremental
class TestUserHandling:
    def test_login(self):
        pass

    def test_modification(self):
        assert 0

    def test_deletion(self):
        pass

def test_normal():
    pass
```

If we run this:

```
$ pytest -rx
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items

test_step.py .Fx. [100%]

================================== FAILURES =================================
____________________ TestUserHandling.test_modification ____________________
self = <test_step.TestUserHandling object at 0xdeadbeef0001>
> def test_modification(self):
      assert 0
```

(continues on next page)
We'll see that `test_deletion` was not executed because `test_modification` failed. It is reported as an “expected failure”.

**Package/Directory-level fixtures (setups)**

If you have nested test directories, you can have per-directory fixture scopes by placing fixture functions in a `conftest.py` file in that directory. You can use all types of fixtures including `autouse fixtures` which are the equivalent of xUnit's setup/teardown concept. It's however recommended to have explicit fixture references in your tests or test classes rather than relying on implicitly executing setup/teardown functions, especially if they are far away from the actual tests.

Here is an example for making a `db` fixture available in a directory:

```python
# content of a/conftest.py
import pytest

class DB:
    pass
```

(continues on next page)
@pytest.fixture(scope="package")
def db():
    return DB()

and then a test module in that directory:

```python
# content of a/test_db.py
def test_a1(db):
    assert 0, db  # to show value
```

another test module:

```python
# content of a/test_db2.py
def test_a2(db):
    assert 0, db  # to show value
```

and then a module in a sister directory which will not see the db fixture:

```python
# content of b/test_error.py
def test_root(db):
    # no db here, will error out
    pass
```

We can run this:

```
$ pytest
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 7 items

a/test_db.py F [ 14%]
a/test_db2.py F [ 28%]
b/test_error.py E [ 42%]
test_step.py .Fx. [100%]

ERROR b/test_error.py::test_root

============= 3 failed, 2 passed, 1 xfailed, 1 error in 0.12s ==============

The two test modules in the a directory see the same db fixture instance while the one test in the sister-directory b doesn’t see it. We could of course also define a db fixture in that sister directory’s conftest.py file. Note that each fixture is only instantiated if there is a test actually needing it (unless you use “autouse” fixture which are always executed ahead of the first test executing).

Post-process test reports / failures

If you want to postprocess test reports and need access to the executing environment you can implement a hook that gets called when the test “report” object is about to be created. Here we write out all failing test calls and also access a fixture (if it was used by the test) in case you want to query/look at it during your post processing. In our case we just write some information out to a failures file:

```python
# content of conftest.py
import os.path
import pytest

@pytest.hookimpl(wrapper=True, tryfirst=True)
def pytest_runtest_makereport(item, call):
    # execute all other hooks to obtain the report object
    rep = yield

    # we only look at actual failing test calls, not setup/teardown
    if rep.when == "call" and rep.failed:
```

(continues on next page)
mode = "a" if os.path.exists("failures") else "w"
with open("failures", mode, encoding="utf-8") as f:
    # let's also access a fixture for the fun of it
    if "tmp_path" in item.fixturenames:
        extra = " {{}}".format(item.funcargs["tmp_path"])
    else:
        extra = ""
    f.write(rep.nodeid + extra + "\n")

    return rep

if you then have failing tests:

    # content of test_module.py
    def test_fail1(tmp_path):
        assert 0

    def test_fail2():
        assert 0

and run them:

    $ pytest test_module.py
    ============================ test session starts ============================

    FAILED test_module.py::test_fail1 - assert 0
    FAILED test_module.py::test_fail2 - assert 0
    ============================================================== 2 failed in 0.12s

you will have a “failures” file which contains the failing test ids:

5.1. Examples and customization tricks
Making test result information available in fixtures

If you want to make test result reports available in fixture finalizers here is a little example implemented via a local plugin:

```python
# content of conftest.py
from typing import Dict
import pytest
from pytest import StashKey, CollectReport

phase_report_key = StashKey[Dict[str, CollectReport]]()

@pytest.hookimpl(wrapper=True, tryfirst=True)
def pytest_runtest_makereport(item, call):
    # execute all other hooks to obtain the report object
    rep = yield

    # store test results for each phase of a call, which can
    # be "setup", "call", "teardown"
    item.stash.setdefault(phase_report_key, {})[rep.when] = rep
    return rep

@ pytest.fixture
def something(request):
    yield
    # request.node is an "item" because we use the default
    # "function" scope
    report = request.node.stash[phase_report_key]
    if report["setup"].failed:
        print("setting up a test failed or skipped", request.node.nodeid)
    elif ("call" not in report) or report["call"].failed:
        print("executing test failed or skipped", request.node.nodeid)
```

if you then have failing tests:

```python
# content of test_module.py
import pytest

@ pytest.fixture
def other():
    assert 0

def test_setup_fails(something, other):
    pass

def test_call_fails(something):
    pass
```

(continues on next page)
and run it:

```bash
$ pytest -s test_module.py
```

You'll see that the fixture finalizers could use the precise reporting information.

---

5.1. Examples and customization tricks 397
PYTEST_CURRENT_TEST environment variable

Sometimes a test session might get stuck and there might be no easy way to figure out which test got stuck, for example if pytest was run in quiet mode (-q) or you don’t have access to the console output. This is particularly a problem if the problem happens only sporadically, the famous “flaky” kind of tests.

pytest sets the PYTEST_CURRENT_TEST environment variable when running tests, which can be inspected by process monitoring utilities or libraries like psutil to discover which test got stuck if necessary:

```python
import psutil

for pid in psutil.pids():
    environ = psutil.Process(pid).environ()
    if "PYTEST_CURRENT_TEST" in environ:
        print(f'pytest process {pid} running: {environ["PYTEST_CURRENT_TEST"]}')
```

During the test session pytest will set PYTEST_CURRENT_TEST to the current test nodeid and the current stage, which can be setup, call, or teardown.

For example, when running a single test function named test_foo from foo_module.py, PYTEST_CURRENT_TEST will be set to:

1. foo_module.py::test_foo (setup)
2. foo_module.py::test_foo (call)
3. foo_module.py::test_foo (teardown)

In that order.

**Note:** The contents of PYTEST_CURRENT_TEST is meant to be human readable and the actual format can be changed between releases (even bug fixes) so it shouldn't be relied on for scripting or automation.

Freezing pytest

If you freeze your application using a tool like PyInstaller in order to distribute it to your end-users, it is a good idea to also package your test runner and run your tests using the frozen application. This way packaging errors such as dependencies not being included into the executable can be detected early while also allowing you to send test files to users so they can run them in their machines, which can be useful to obtain more information about a hard to reproduce bug.

Fortunately recent PyInstaller releases already have a custom hook for pytest, but if you are using another tool to freeze executables such as cx_freeze or py2exe, you can use pytest.freeze_includes() to obtain the full list of internal pytest modules. How to configure the tools to find the internal modules varies from tool to tool, however.

Instead of freezing the pytest runner as a separate executable, you can make your frozen program work as the pytest runner by some clever argument handling during program startup. This allows you to have a single executable, which is usually more convenient. Please note that the mechanism for plugin discovery used by pytest (entry points) doesn't work with frozen executables so pytest can't find any third party plugins automatically. To include third party plugins like pytest-timeout they must be imported explicitly and passed on to pytest.main.

```python
# contents of app_main.py
import sys
import pytest_timeout  # Third party plugin

if len(sys.argv) > 1 and sys.argv[1] == "--pytest":
    # (continues on next page)
```
import pytest

sys.exit(pytest.main(sys.argv[2:], plugins=[pytest_timeout]))
else:
    # normal application execution: at this point argv can be parsed
    # by your argument-parsing library of choice as usual
    ...

This allows you to execute tests using the frozen application with standard pytest command-line options:

```bash
./app_main --pytest --verbose --tb=long --junit=xml=results.xml test-suite/
```

### 5.1.3 Parametrizing tests

pytest allows to easily parametrize test functions. For basic docs, see *How to parametrize fixtures and test functions*. In the following we provide some examples using the built-in mechanisms.

**Generating parameters combinations, depending on command line**

Let's say we want to execute a test with different computation parameters and the parameter range shall be determined by a command line argument. Let's first write a simple (do-nothing) computation test:

```python
# content of test_compute.py
def test_compute(param1):
    assert param1 < 4
```

Now we add a test configuration like this:

```python
# content of conftest.py
def pytest_addoption(parser):
    parser.addoption("--all", action="store_true", help="run all combinations")

def pytest_generate_tests(metafunc):
    if "param1" in metafunc.fixturenames:
        if metafunc.config.getoption("all"):
            end = 5
        else:
            end = 2
        metafunc.parametrize("param1", range(end))
```

This means that we only run 2 tests if we do not pass `--all`:

```bash
$ pytest -q test_compute.py
...
2 passed in 0.12s  [100%]
```

We run only two computations, so we see two dots. Let's run the full monty:
As expected when running the full range of param1 values we'll get an error on the last one.

**Different options for test IDs**

pytest will build a string that is the test ID for each set of values in a parametrized test. These IDs can be used with `-k` to select specific cases to run, and they will also identify the specific case when one is failing. Running pytest with `--collect-only` will show the generated IDs.

Numbers, strings, booleans and None will have their usual string representation used in the test ID. For other objects, pytest will make a string based on the argument name:

```python
# content of test_time.py

from datetime import datetime, timedelta
import pytest

testdata = [
    (datetime(2001, 12, 12), datetime(2001, 12, 11), timedelta(1)),
    (datetime(2001, 12, 11), datetime(2001, 12, 12), timedelta(-1)),
]  

@pytest.mark.parametrize("a,b,expected", testdata)
def test_timedistance_v0(a, b, expected):
    diff = a - b
    assert diff == expected

@pytest.mark.parametrize("a,b,expected", testdata, ids=["forward", "backward"])
def test_timedistance_v1(a, b, expected):
    diff = a - b
    assert diff == expected

def idfn(val):
    if isinstance(val, (datetime,)):
        # note this wouldn't show any hours/minutes/seconds
        return val.strftime("%Y%m%d")
```

(continues on next page)
@pytest.mark.parametrize("a,b,expected", testdata, ids=idfn)
def test_timedistance_v2(a, b, expected):
    diff = a - b
    assert diff == expected

@ pytest.mark.parametrize(
    "a,b,expected",
    [
        pytest.param(
            datetime(2001, 12, 12), datetime(2001, 12, 11), timedelta(1), id="forward"
        ),
        pytest.param(
            datetime(2001, 12, 11), datetime(2001, 12, 12), timedelta(-1), id="backward"
        ),
    ],
)

def test_timedistance_v3(a, b, expected):
    diff = a - b
    assert diff == expected

In test_timedistance_v0, we let pytest generate the test IDs.

In test_timedistance_v1, we specified ids as a list of strings which were used as the test IDs. These are succinct, but can be a pain to maintain.

In test_timedistance_v2, we specified ids as a function that can generate a string representation to make part of the test ID. So our datetime values use the label generated by idfn, but because we didn't generate a label for timedelta objects, they are still using the default pytest representation:

```
$ pytest test_time.py --collect-only
================================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 8 items

<Dir parametrize.rst-200>
  <Module test_time.py>
    <Function test_timedistance_v0[a0-b0-expected0]>
    <Function test_timedistance_v0[a1-b1-expected1]>
    <Function test_timedistance_v1[forward]>
    <Function test_timedistance_v1[backward]>
    <Function test_timedistance_v2[20011212-20011211-expected0]>
    <Function test_timedistance_v2[20011211-20011212-expected1]>
    <Function test_timedistance_v3[forward]>
    <Function test_timedistance_v3[backward]>

================================== 8 tests collected in 0.12s ============================
```

In test_timedistance_v3, we used pytest.param to specify the test IDs together with the actual data, instead of listing them separately.
A quick port of “testscenarios”

Here is a quick port to run tests configured with testscenarios, an add-on from Robert Collins for the standard unittest framework. We only have to work a bit to construct the correct arguments for pytest’s `Metafunc.parametrize`:

```python
# content of test_scenarios.py

def pytest_generate_tests(metafunc):
    idlist = []
    argvalues = []
    for scenario in metafunc.cls.scenarios:
        idlist.append(scenario[0])
        items = scenario[1].items()
        argnames = [x[0] for x in items]
        argvalues.append([x[1] for x in items])
    metafunc.parametrize(argnames, argvalues, ids=idlist, scope="class")

scenario1 = ("basic", {"attribute": "value"})
scenario2 = ("advanced", {"attribute": "value2"})

class TestSampleWithScenarios:
    scenarios = [scenario1, scenario2]

    def test_demo1(self, attribute):
        assert isinstance(attribute, str)
    
    def test_demo2(self, attribute):
        assert isinstance(attribute, str)
```

this is a fully self-contained example which you can run with:

```bash
$ pytest test_scenarios.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items

test_scenarios.py .... [100%]
============================ 4 passed in 0.12s =============================
```

If you just collect tests you’ll also nicely see ‘advanced’ and ‘basic’ as variants for the test function:

```bash
$ pytest --collect-only test_scenarios.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items

<Dir parametrize.rst-200>
<Module test_scenarios.py>
   <Class TestSampleWithScenarios>
      <Function test_demo1[basic]>
      <Function test_demo2[basic]>
      <Function test_demo1[advanced]>
(continues on next page)
```
Note that we told `metaclass.parametrize()` that your scenario values should be considered class-scoped. With pytest-2.3 this leads to a resource-based ordering.

### Deferring the setup of parametrized resources

The parametrization of test functions happens at collection time. It is a good idea to setup expensive resources like DB connections or subprocess only when the actual test is run. Here is a simple example how you can achieve that. This test requires a `db` object fixture:

```python
# content of test_backends.py
import pytest

def test_db_initialized(db):
    # a dummy test
    if db.__class__.__name__ == "DB2":
        pytest.fail("deliberately failing for demo purposes")
```

We can now add a test configuration that generates two invocations of the `test_db_initialized` function and also implements a factory that creates a database object for the actual test invocations:

```python
# content of conftest.py
import pytest

def pytest_generate_tests(metafunc):
    if "db" in metafunc.fixturenames:
        metafunc.parametrize("db", ["d1", "d2"], indirect=True)

class DB1:
    "one database object"

class DB2:
    "alternative database object"

@fixture
def db(request):
    if request.param == "d1":
        return DB1()
    elif request.param == "d2":
        return DB2()
    else:
        raise ValueError("invalid internal test config")
```

Let's first see how it looks like at collection time:
$ pytest test_backends.py --collect-only
================================= test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items

<Dir parametrize.rst-200>
  <Module test_backends.py>
    <Function test_db_initialized[d1]>
    <Function test_db_initialized[d2]>

================================= 2 tests collected in 0.12s ========================

And then when we run the test:

$ pytest -q test_backends.py
.F
[100%]

================================= FAILURES =================================
_________________________ test_db_initialized[d2] __________________________
db = <conftest.DB2 object at 0xdeadbeef0001>

    def test_db_initialized(db):
        # a dummy test
        if db.__class__.__name__ == "DB2":
            pytest.fail("deliberately failing for demo purposes")
E Failed: deliberately failing for demo purposes

The first invocation with db == "DB1" passed while the second with db == "DB2" failed. Our db fixture function has instantiated each of the DB values during the setup phase while the pytest_generate_tests generated two according calls to the test_db_initialized during the collection phase.

**Indirect parametrization**

Using the indirect=True parameter when parametrizing a test allows to parametrize a test with a fixture receiving the values before passing them to a test:

```python
import pytest

@pytest.fixture
def fixt(request):
    return request.param * 3

@ pytest.mark.parametrize("fixt", ["a", "b"], indirect=True)
def test_indirect(fixt):
    assert len(fixt) == 3
```

This can be used, for example, to do more expensive setup at test run time in the fixture, rather than having to run those setup steps at collection time.
Apply indirect on particular arguments

Very often parametrization uses more than one argument name. There is opportunity to apply indirect parameter on particular arguments. It can be done by passing list or tuple of arguments’ names to indirect. In the example below there is a function test_indirect which uses two fixtures: x and y. Here we give to indirect the list, which contains the name of the fixture x. The indirect parameter will be applied to this argument only, and the value a will be passed to respective fixture function:

```python
# content of test_indirect_list.py
import pytest

@pytest.fixture(scope="function")
def x(request):
    return request.param * 3

@pytest.fixture(scope="function")
def y(request):
    return request.param * 2

@pytest.mark.parametrize("x, y", [("a", "b")], indirect=["x"])
def test_indirect(x, y):
    assert x == "aaa"
    assert y == "b"
```

The result of this test will be successful:

```
$ pytest -v test_indirect_list.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
→python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 1 item
test_indirect_list.py::test_indirect[a-b] PASSED [100%]
============================ 1 passed in 0.12s =============================
```

Parametrizing test methods through per-class configuration

Here is an example pytest_generate_tests function implementing a parametrization scheme similar to Michael Foord’s unittest parametrizer but in a lot less code:

```python
# content of ./test_parametrize.py
import pytest

def pytest_generate_tests(metafunc):
    # called once per each test function
    funcarglist = metafunc.cls.params[metafunc.function.__name__]
    argnames = sorted(funcarglist[0])
    metafunc.parametrize(
```

(continues on next page)
class TestClass:
    # a map specifying multiple argument sets for a test method
    params = {
        "test_equals": [dict(a=1, b=2), dict(a=3, b=3)],
        "test_zerodivision": [dict(a=1, b=0)],
    }

    def test_equals(self, a, b):
        assert a == b

    def test_zerodivision(self, a, b):
        with pytest.raises(ZeroDivisionError):
            a / b

Our test generator looks up a class-level definition which specifies which argument sets to use for each test function. Let's run it:

```bash
$ pytest -q
F.. [100%]
================================= FAILURES =================================
________________________ TestClass.test_equals[1-2] ________________________
self = <test_parametrize.TestClass object at 0xdeadbeef0002>, a = 1, b = 2

    def test_equals(self, a, b):
>       assert a == b
E       assert 1 == 2

test_parametrize.py:21: AssertionError
```

Parametrization with multiple fixtures

Here is a stripped down real-life example of using parametrized testing for testing serialization of objects between different python interpreters. We define a `test_basic_objects` function which is to be run with different sets of arguments for its three arguments:

- **python1**: first python interpreter, run to pickle-dump an object to a file
- **python2**: second interpreter, run to pickle-load an object from a file
- **obj**: object to be dumped/loaded

```python
"""
Module containing a parametrized tests testing cross-python serialization via the pickle module.""

from __future__ import annotations

import shutil
import subprocess
```

(continues on next page)
import textwrap
import pytest

pythonlist = ["python3.9", "python3.10", "python3.11"]

@ pytest.fixture(params=pythonlist)
def python1(request, tmp_path):
    picklefile = tmp_path / "data.pickle"
    return Python(request.param, picklefile)

@ pytest.fixture(params=pythonlist)
def python2(request, python1):
    return Python(request.param, python1.picklefile)

class Python:
    def __init__(self, version, picklefile):
        self.pythonpath = shutil.which(version)
        if not self.pythonpath:
            pytest.skip(f"{version!r} not found")
        self.picklefile = picklefile

    def dumps(self, obj):
        dumpfile = self.picklefile.with_name("dump.py")
        dumpfile.write_text(textwrap.dedent(  
            rf""""  
            import pickle  
            f = open(\{str(self.picklefile)!r\}, 'wb')  
            s = pickle.dump(\{obj!r\}, f, protocol=2)  
            f.close()  
            """
        )
        subprocess.run((self.pythonpath, str(dumpfile)), check=True)

    def load_and_is_true(self, expression):
        loadfile = self.picklefile.with_name("load.py")
        loadfile.write_text(textwrap.dedent(  
            rf""""  
            import pickle  
            f = open(\{str(self.picklefile)!r\}, 'rb')  
            obj = pickle.load(f)  
            f.close()  
            res = eval(\{expression!r\})  
            if not res:  
                raise SystemExit(1)  
            """
        )
        print(loadfile)
        subprocess.run((self.pythonpath, str(loadfile)), check=True)
@pytest.mark.parametrize("obj", [42, {}, {1: 3}])
def test_basic_objects(python1, python2, obj):
    python1.dumps(obj)
    python2.load_and_is_true(f"obj == {obj}")

Running it results in some skips if we don't have all the python interpreters installed and otherwise runs all combinations
(3 interpreters times 3 interpreters times 3 objects to serialize/deserialize):

$ pytest -rs -q multipython.py

------------------------- short test summary info -------------------------
SKIPPED [12] multipython.py:65: 'python3.9' not found
SKIPPED [12] multipython.py:65: 'python3.11' not found
3 passed, 24 skipped in 0.12s

Parametrization of optional implementations/imports

If you want to compare the outcomes of several implementations of a given API, you can write test functions that receive
the already imported implementations and get skipped in case the implementation is not importable/available. Let's say
we have a “base” implementation and the other (possibly optimized ones) need to provide similar results:

# content of conftest.py

import pytest

@ pytest.fixture(scope="session")
def basemod(request):
    return pytest.importorskip("base")

@ pytest.fixture(scope="session", params=["opt1", "opt2")
def optmod(request):
    return pytest.importorskip(request.param)

And then a base implementation of a simple function:

# content of base.py

def func1():
    return 1

And an optimized version:

# content of opt1.py

def func1():
    return 1.0001

And finally a little test module:

# content of test_module.py

(continues on next page)
def test_func1(basemod, optmod):
    assert round(basemod.func1(), 3) == round(optmod.func1(), 3)

If you run this with reporting for skips enabled:

```
$ pytest -rs test_module.py
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 2 items
test_module.py .s [100%]
========================= short test summary info ==========================
SKIPPED [1] test_module.py:3: could not import 'opt2': No module named 'opt2'
======================= 1 passed, 1 skipped in 0.12s =======================
```

You'll see that we don't have an `opt2` module and thus the second test run of our `test_func1` was skipped. A few notes:

- the fixture functions in the `conftest.py` file are “session-scoped” because we don’t need to import more than once
- if you have multiple test functions and a skipped import, you will see the [1] count increasing in the report
- you can put `@pytest.mark.parametrize` style parametrization on the test functions to parametrize input/output values as well.

### Set marks or test ID for individual parametrized test

Use `pytest.param` to apply marks or set test ID to individual parametrized test. For example:

```
# content of test_pytest_param_example.py
import pytest

@pytest.mark.parametrize(
    "test_input, expected",
    [(
        "3+5", 8),
        pytest.param("1+7", 8, marks=pytest.mark.basic),
        pytest.param("2+4", 6, marks=pytest.mark.basic, id="basic_2+4"),
        pytest.param("6*9", 42, marks=[pytest.mark.basic, pytest.mark.xfail], id="basic_6*9"
    ],
)
def test_eval(test_input, expected):
    assert eval(test_input) == expected
```

In this example, we have 4 parametrized tests. Except for the first test, we mark the rest three parametrized tests with the custom marker `basic`, and for the fourth test we also use the built-in mark `xfail` to indicate this test is expected to fail. For explicitness, we set test ids for some tests.

Then run `pytest` with verbose mode and with only the `basic` marker:
As the result:

- Four tests were collected
- One test was deselected because it doesn’t have the `basic` mark.
- Three tests with the `basic` mark were selected.
- The test `test_eval[1+7-8]` passed, but the name is autogenerated and confusing.
- The test `test_eval[basic_2+4]` passed.
- The test `test_eval[basic_6*9]` was expected to fail and did fail.

### Parametrizing conditional raising

Use `pytest.raises()` with the `pytest.mark.parametrize` decorator to write parametrized tests in which some tests raise exceptions and others do not.

`contextlib.nullcontext` can be used to test cases that are not expected to raise exceptions but that should result in some value. The value is given as the `enter_result` parameter, which will be available as the `with` statement’s target (`e` in the example below).

For example:

```python
from contextlib import nullcontext

import pytest

@pytest.mark.parametrize(
    "example_input,expectation",
    [
        (3, nullcontext(2)),
        (2, nullcontext(3)),
        (1, nullcontext(6)),
        (0, pytest.raises(ZeroDivisionError)),
    ],
)
def test_division(example_input, expectation):
    """Test how much I know division."""
    with expectation as e:
        assert (6 / example_input) == e
```
In the example above, the first three test cases should run without any exceptions, while the fourth should raise a “ZeroDivisionError” exception, which is expected by pytest.

5.1.4 Working with custom markers

Here are some examples using the How to mark test functions with attributes mechanism.

Marking test functions and selecting them for a run

You can “mark” a test function with custom metadata like this:

```python
# content of test_server.py
import pytest

@pytest.mark.webtest
def test_send_http():
    pass  # perform some webtest test for your app

@pytest.mark.device(serial="123")
def test_something_quick():
    pass

@pytest.mark.device(serial="abc")
def test_another():
    pass

class TestClass:
    def test_method(self):
        pass
```

You can then restrict a test run to only run tests marked with webtest:

```
$ pytest -v -m webtest
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
→python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 4 items / 3 deselected / 1 selected

test_server.py::test_send_http PASSED [100%]

======================== 1 passed, 3 deselected in 0.12s =========================
```

Or the inverse, running all tests except the webtest ones:

```
$ pytest -v -m "not webtest"
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
→python

(continues on next page)
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 4 items / 1 deselected / 3 selected

test_server.py::test_something_quick PASSED [33%]
test_server.py::test_another PASSED [66%]
test_server.py::TestClass::test_method PASSED [100%]

====================== 3 passed, 1 deselected in 0.12s ======================

Additionally, you can restrict a test run to only run tests matching one or multiple marker keyword arguments, e.g. to run only tests marked with `device` and the specific `serial="123"`:

```
$ pytest -v -m "device(serial='123')"
```

Note: Only keyword argument matching is supported in marker expressions.

Note: Only `int`, `(unescape) str`, `bool`, & `None` values are supported in marker expressions.

Selecting tests based on their node ID

You can provide one or more `node IDs` as positional arguments to select only specified tests. This makes it easy to select tests based on their module, class, method, or function name:

```
$ pytest -v test_server.py::TestClass::test_method
```

You can also select on the class:

```
$ pytest -v test_server.py::TestClass
```
Or select multiple nodes:

```
$ pytest -v test_server.py::TestClass test_server.py::test_send_http
```

Platform:

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
```

CACHEDIR:

```
cachedir: .pytest_cache
```

ROOTDIR:

```
rootdir: /home/sweet/project
```

Collecting:

```
collecting ... collected 2 items
```

Test Results:

```
test_server.py::TestClass::test_method PASSED [ 50%]
test_server.py::test_send_http PASSED [100%]
```

Summary:

```
2 passed in 0.12s
```

Note:

Node IDs are of the form `module.py::class::method` or `module.py::function`. Node IDs control which tests are collected, so `module.py::class` will select all test methods on the class. Nodes are also created for each parameter of a parametrized fixture or test, so selecting a parametrized test must include the parameter value, e.g. `module.py::function[param]`.

Node IDs for failing tests are displayed in the test summary info when running pytest with the `-rf` option. You can also construct Node IDs from the output of `pytest --collect-only`.

Using `-k expr` to select tests based on their name

Added in version 2.0/2.3.4.

You can use the `-k` command line option to specify an expression which implements a substring match on the test names instead of the exact match on markers that `-m` provides. This makes it easy to select tests based on their names:

```
$ pytest -v -k http # running with the above defined example module
```

Summary:

```
1 passed, 3 deselected in 0.12s
```
And you can also run all tests except the ones that match the keyword:

```
$ pytest -k "not send_http" -v
```

```
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
  → python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 4 items / 1 deselected / 3 selected

test_server.py::test_something_quick PASSED [ 33%]
test_server.py::test_another PASSED [ 66%]
test_server.py::TestClass::test_method PASSED [100%]

===================== 3 passed, 1 deselected in 0.12s ======================
```

Or to select “http” and “quick” tests:

```
$ pytest -k "http or quick" -v
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
  → python
cachedir: .pytest_cache
rootdir: /home/sweet/project
collecting ... collected 4 items / 2 deselected / 2 selected

test_server.py::test_send_http PASSED [ 50%]
test_server.py::test_something_quick PASSED [100%]

===================== 2 passed, 2 deselected in 0.12s ======================
```

You can use and, or, not and parentheses.

In addition to the test’s name, –k also matches the names of the test’s parents (usually, the name of the file and class it’s in), attributes set on the test function, markers applied to it or its parents and any extra keywords explicitly added to it or its parents.

### Registering markers

Registering markers for your test suite is simple:

```
# content of pytest.ini
[pytest]
markers =
  webtest: mark a test as a webtest.
  slow: mark test as slow.
```

Multiple custom markers can be registered, by defining each one in its own line, as shown in above example.

You can ask which markers exist for your test suite - the list includes our just defined webtest and slow markers:

```
$ pytest --markers
@pytest.mark.webtest: mark a test as a webtest.
@pytest.mark.slow: mark test as slow.
@pytest.mark.filterwarnings(warning): add a warning filter to the given test. see...
```

(continues on next page)
pytest Documentation, Release 8.3

(continued from previous page)

@pytest.mark.skip(reason=None): skip the given test function with an optional reason.
Example: skip(reason="no way of currently testing this") skips the test.

@pytest.mark.skipif(condition, ..., *, reason=...): skip the given test function if any of the conditions evaluate to True. Example: skipif(sys.platform == 'win32') skips the test if we are on the win32 platform. See https://docs.pytest.org/en/stable/reference/reference.html#pytest-mark-skipif

@ pytest.mark.xfail(condition, ..., *, reason=..., run=True, raises=None, strict=xfail_strict): mark the test function as an expected failure if any of the conditions evaluate to True. Optionally specify a reason for better reporting and run=False if you don't even want to execute the test function. If only specific exception(s) are expected, you can list them in raises, and if the test fails in other ways, it will be reported as a true failure. See https://docs.pytest.org/en/stable/reference/reference.html#pytest-mark-xfail

@ pytest.mark.parametrize(argnames, argvalues): call a test function multiple times passing in different arguments in turn. argvalues generally needs to be a list of values if argnames specifies only one name or a list of tuples of values if argnames specifies multiple names. Example: @parametrize('arg1', [1,2]) would lead to two calls of the decorated test function, one with arg1=1 and another with arg1=2. See https://docs.pytest.org/en/stable/how-to/parametrize.html for more info and examples.

@ pytest.mark.usefixtures(fixturename1, fixturename2, ...): mark tests as needing all of the specified fixtures. See https://docs.pytest.org/en/stable/explanation/fixtures.html#usefixtures

@ pytest.mark.tryfirst: mark a hook implementation function such that the plugin machinery will try to call it first/as early as possible. DEPRECATED, use @pytest.hookimpl(tryfirst=True) instead.

@ pytest.mark.trylast: mark a hook implementation function such that the plugin machinery will try to call it last/as late as possible. DEPRECATED, use @pytest.hookimpl(trylast=True) instead.

For an example on how to add and work with markers from a plugin, see Custom marker and command line option to control test runs.

Note: It is recommended to explicitly register markers so that:

- There is one place in your testsuite defining your markers
- Asking for existing markers via pytest --markers gives good output
- Typos in function markers are treated as an error if you use the --strict-markers option.

5.1. Examples and customization tricks
Marking whole classes or modules

You may use pytest.mark decorators with classes to apply markers to all of its test methods:

```python
def test_startup(self):
    pass
def test_startup_and_more(self):
    pass
```

This is equivalent to directly applying the decorator to the two test functions.

To apply marks at the module level, use the pytestmark global variable:

```python
import pytest
pytestmark = pytest.mark.webtest
```

or multiple markers:

```python
pytestmark = [pytest.mark.webtest, pytest.mark.slowtest]
```

Due to legacy reasons, before class decorators were introduced, it is possible to set the pytestmark attribute on a test class like this:

```python
import pytest
class TestClass:
    pytestmark = pytest.mark.webtest
```

Marking individual tests when using parametrize

When using parametrize, applying a mark will make it apply to each individual test. However it is also possible to apply a marker to an individual test instance:

```python
import pytest

@pytest.mark.foo
@pytest.mark.parametrize(
    ("n", "expected"), [(1, 2), pytest.param(1, 3, marks=pytest.mark.bar), (2, 3)]
)
def test_increment(n, expected):
    assert n + 1 == expected
```

In this example the mark “foo” will apply to each of the three tests, whereas the “bar” mark is only applied to the second test. Skip and xfail marks can also be applied in this way, see Skip/xfail with parametrize.
Custom marker and command line option to control test runs

Plugins can provide custom markers and implement specific behaviour based on it. This is a self-contained example which adds a command line option and a parametrized test function marker to run tests specified via named environments:

```python
# content of conftest.py
import pytest

def pytest_addoption(parser):
    parser.addoption("-E",
                    action="store",
                    metavar="NAME",
                    help="only run tests matching the environment NAME.",
                   )

def pytest_configure(config):
    # register an additional marker
    config.addinivalue_line("
        "markers", "env(name): mark test to run only on named environment"
    )

def pytest_runtest_setup(item):
    envnames = [mark.args[0] for mark in item.iter_markers(name="env")]
    if envnames:
        if item.config.getoption("-E") not in envnames:
            pytest.skip(f"test requires env in {envnames!r}"

A test file using this local plugin:

```python
# content of test_someenv.py
import pytest

@ pytest.mark.env("stage1")
def test_basic_db_operation():
    pass
```

and an example invocations specifying a different environment than what the test needs:

```
$ pytest -E stage2
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 1 item

test_someenv.py s [100%]

============================ 1 skipped in 0.12s ============================
```

and here is one that specifies exactly the environment needed:

```
```
$ pytest --markers

The `--markers` option always gives you a list of available markers:

- `@pytest.mark.env(name)`: mark test to run only on named environment
- `@pytest.mark.filterwarnings(warning)`: add a warning filter to the given test. See https://docs.pytest.org/en/stable/how-to/capture-warnings.html#pytest-mark-filterwarnings
- `@pytest.mark.skip(reason=None)`: skip the given test function with an optional reason. Example: `skip(reason="no way of currently testing this")` skips the test.
- `@pytest.mark.skipif(condition, ..., *, reason=...)`: skip the given test function if any of the conditions evaluate to True. Example: `skipif(sys.platform == 'win32')` skips the test if we are on the win32 platform. See https://docs.pytest.org/en/stable/reference/reference.html#pytest-mark-skipif
- `@pytest.mark.xfail(condition, ..., *, reason=..., run=True, raises=None, strict=xfail_)`: mark the test function as an expected failure if any of the conditions evaluate to True. Optionally specify a reason for better reporting and run=False if you don't even want to execute the test function. If only specific exception(s) are expected, you can list them in raises, and if the test fails in other ways, it will be reported as a true failure. See https://docs.pytest.org/en/stable/reference/reference.html#pytest-mark-xfail
- `@pytest.mark.parametrize(argnames, argvalues)`: call a test function multiple times, passing in different arguments in turn. argvalues generally needs to be a list of values if argnames specifies only one name or a list of tuples of values if argnames specifies multiple names. Example: `@parametrize('arg1', [1,2])` would lead to two calls of the decorated test function, one with arg1=1 and another with arg1=2. See https://docs.pytest.org/en/stable/how-to/parametrize.html for more info and examples.
- `@pytest.mark.usefixtures(fixturename1, fixturename2, ...)`: mark tests as needing all of the specified fixtures. See https://docs.pytest.org/en/stable/explanation/fixtures.html#usefixtures
- `@pytest.mark.tryfirst`: mark a hook implementation function such that the plugin machinery will try to call it first/as early as possible. DEPRECATED, use @pytest.hookimpl(tryfirst=True) instead.
- `@pytest.mark.trylast`: mark a hook implementation function such that the plugin machinery will try to call it last/as late as possible. DEPRECATED, use @pytest.hookimpl(trylast=True) instead.
Passing a callable to custom markers

Below is the config file that will be used in the next examples:

```
# content of conftest.py
import sys

def pytest_runtest_setup(item):
    for marker in item.iter_markers(name="my_marker"):
        print(marker)
        sys.stdout.flush()
```

A custom marker can have its argument set, i.e. `args` and `kwargs` properties, defined by either invoking it as a callable or using `pytest.mark.MARKER_NAME.with_args`. These two methods achieve the same effect most of the time.

However, if there is a callable as the single positional argument with no keyword arguments, using the `pytest.mark.MARKER_NAME(c)` will not pass `c` as a positional argument but decorate `c` with the custom marker (see `MarkDecorator`). Fortunately, `pytest.mark.MARKER_NAME.with_args` comes to the rescue:

```
# content of test_custom_marker.py
import pytest

def hello_world(*args, **kwargs):
    return "Hello World"

@pytest.mark.my_marker.with_args(hello_world)
def test_with_args():
    pass
```

The output is as follows:

```
$ pytest -q -s
Mark(name='my_marker', args=('<function hello_world at 0xdeadbeef0001>,'), kwargs={})
1 passed in 0.12s
```

We can see that the custom marker has its argument set extended with the function `hello_world`. This is the key difference between creating a custom marker as a callable, which invokes `__call__` behind the scenes, and using `with_args`.

Reading markers which were set from multiple places

If you are heavily using markers in your test suite you may encounter the case where a marker is applied several times to a test function. From plugin code you can read over all such settings. Example:

```
# content of test_mark_three_times.py
import pytest

pytestmark = pytest.mark.glob("module", x=1)

@ pytest.mark.glob("class", x=2)
class TestClass:
```

(continues on next page)
Here we have the marker “glob” applied three times to the same test function. From a conftest file we can read it like this:

```python
import sys

def pytest_runtest_setup(item):
    supported_platforms = ALL.intersection(mark.name for mark in item.iter_markers())
    plat = sys.platform
    if supported_platforms and plat not in supported_platforms:
        pytest.skip(f"cannot run on platform {plat}"
```

Let's run this without capturing output and see what we get:

```
$ pytest -q -s
glob args=('function',) kwargs={'x': 3}
glob args=('class',) kwargs={'x': 2}
glob args=('module',) kwargs={'x': 1}
.
1 passed in 0.12s
```

## Marking platform specific tests with pytest

Consider you have a test suite which marks tests for particular platforms, namely `pytest.mark.darwin`, `pytest.mark.win32` etc. and you also have tests that run on all platforms and have no specific marker. If you now want to have a way to only run the tests for your particular platform, you could use the following plugin:

```python
import sys
import pytest

ALL = set("darwin linux win32".split())

def pytest_runtest_setup(item):
    supported_platforms = ALL.intersection(mark.name for mark in item.iter_markers())
    plat = sys.platform
    if supported_platforms and plat not in supported_platforms:
        pytest.skip(f"cannot run on platform {plat}"
```

then tests will be skipped if they were specified for a different platform. Let's do a little test file to show how this looks like:

```python
import pytest

@pytest.mark.darwin
def test_if_apple_is_evil():
```
then you will see two tests skipped and two executed tests as expected:

```bash
$ pytest -rs # this option reports skip reasons
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items

test_plat.py s.s. [100%]

==================================== short test summary info =====================================
==================================== 2 passed, 2 skipped in 0.12s ======================================
```

Note that if you specify a platform via the marker-command line option like this:

```bash
$ pytest -m linux
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items / 3 deselected / 1 selected

test_plat.py . [100%]

==================================== 1 passed, 3 deselected in 0.12s ======================================
```

then the unmarked-tests will not be run. It is thus a way to restrict the run to the specific tests.

### Automatically adding markers based on test names

If you have a test suite where test function names indicate a certain type of test, you can implement a hook that automatically defines markers so that you can use the `-m` option with it. Let's look at this test module:

```python
# content of test_module.py

def test_interface_simple():
    assert 0
```

5.1. Examples and customization tricks
We want to dynamically define two markers and can do it in a `conftest.py` plugin:

```python
import pytest

def pytest_collection_modifyitems(items):
    for item in items:
        if "interface" in item.nodeid:
            item.add_marker(pytest.mark.interface)
        elif "event" in item.nodeid:
            item.add_marker(pytest.mark.event)
```

We can now use the `-m` option to select one set:

```
$ pytest -m interface --tb=short
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items / 2 deselected / 2 selected

test_module.py FF [100%]

========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items / 2 deselected / 2 selected

test_module.py FF

test_module.py::test_interface_simple FF
  test_module.py:4: in test_interface_simple
    assert 0
  E   assert 0

  test_module.py::test_interface_complex FF
  test_module.py:8: in test_interface_complex
    assert 0
  E   assert 0

```

or to select both “event” and “interface” tests:

```
$ pytest -m "interface or event" --tb=short
```

```
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
collected 4 items / 1 deselected / 3 selected

test_module.py::test_interface_simple FF
  test_module.py:4: in test_interface_simple
    assert 0
  E   assert 0

  test_module.py::test_interface_complex FF
  test_module.py:8: in test_interface_complex
    assert 0
  E   assert 0

```

(continues on next page)
5.1.5 A session-fixture which can look at all collected tests

A session-scoped fixture effectively has access to all collected test items. Here is an example of a fixture function which walks all collected tests and looks if their test class defines a `callme` method and calls it:

```python
# content of conftest.py
import pytest

@pytest.fixture(scope="session", autouse=True)
def callattr_ahead_of_alltests(request):
    print("callattr_ahead_of_alltests called")
    seen = {None}
    session = request.node
    for item in session.items:
        cls = item.getparent(pytest.Class)
        if cls not in seen:
            if hasattr(cls.obj, "callme"):
                cls.obj.callme()
            seen.add(cls)
```

test classes may now define a `callme` method which will be called ahead of running any tests:

```python
# content of test_module.py

class TestHello:
    @classmethod
    def callme(cls):
        print("callme called!")

    def test_method1(self):
```

(continues on next page)
print("test_method1 called")

def test_method2(self):
    print("test_method2 called")

class TestOther:
    @classmethod
    def callme(cls):
        print("callme other called")

    def test_other(self):
        print("test other")

# works with unittest as well ...
import unittest

class SomeTest(unittest.TestCase):
    @classmethod
    def callme(self):
        print("SomeTest callme called")

    def test_unit1(self):
        print("test_unit1 method called")

If you run this without output capturing:

$ pytest -q -s test_module.py
callattr-ahead-of-all-tests called
callme called!
callme other called
SomeTest callme called
test_method1 called
.test_method2 called
.test other
.test_unit1 method called
.
4 passed in 0.12s

5.1.6 Changing standard (Python) test discovery

Ignore paths during test collection

You can easily ignore certain test directories and modules during collection by passing the --ignore=path option on the cli. pytest allows multiple --ignore options. Example:

tests/
|-- example
 | -- test_example_01.py
 | -- test_example_02.py
 | '-- test_example_03.py
|-- foobar
Now if you invoke pytest with `--ignore=tests/foobar/test_foobar_03.py --ignore=tests/hello/`, you will see that pytest only collects test-modules, which do not match the patterns specified:

```
platform linux -- Python 3.x.y, pytest-5.x.y, py-1.x.y, pluggy-0.x.y
rootdir: $REGENDOC_TMPDIR, inifile:
collected 5 items
tests/example/test_example_01.py . [ 20%]
tests/example/test_example_02.py . [ 40%]
tests/example/test_example_03.py . [ 60%]
tests/foobar/test_foobar_01.py . [ 80%]
tests/foobar/test_foobar_02.py . [100%]
```

The `--ignore-glob` option allows to ignore test file paths based on Unix shell-style wildcards. If you want to exclude test-modules that end with `_01.py`, execute pytest with `--ignore-glob='*_01.py'`.

**Deselect tests during test collection**

Tests can individually be deselected during collection by passing the `--deselect=item` option. For example, say tests/foobar/test_foobar_01.py contains test_a and test_b. You can run all of the tests within tests/ except for tests/foobar/test_foobar_01.py::test_a by invoking pytest with `--deselect tests/foobar/test_foobar_01.py::test_a`. pytest allows multiple `--deselect` options.

**Keeping duplicate paths specified from command line**

Default behavior of pytest is to ignore duplicate paths specified from the command line. Example:

```
pytest path_a path_a
...
collected 1 item
...
```

Just collect tests once.

To collect duplicate tests, use the `--keep-duplicates` option on the cli. Example:

```
pytest --keep-duplicates path_a path_a
...
collected 2 items
...
```
As the collector just works on directories, if you specify twice a single test file, `pytest` will still collect it twice, no matter if the `--keep-duplicates` is not specified. Example:

```bash
pytest test_a.py test_a.py
...
collected 2 items
...```

**Changing directory recursion**

You can set the `norecursedirs` option in an ini-file, for example your `pytest.ini` in the project root directory:

```ini
# content of pytest.ini
[pytest]
norecursedirs = .svn _build tmp*
```

This would tell `pytest` to not recurse into typical subversion or sphinx-build directories or into any `tmp` prefixed directory.

**Changing naming conventions**

You can configure different naming conventions by setting the `python_files`, `python_classes` and `python_functions` in your configuration file. Here is an example:

```ini
# content of pytest.ini
# Example 1: have pytest look for "check" instead of "test"
[pytest]
python_files = check_*.py
python_classes = Check
python_functions = *_check
```

This would make `pytest` look for tests in files that match the `check_*.py` glob-pattern, `Check` prefixes in classes, and functions and methods that match `*_check`. For example, if we have:

```python
# content of check_myapp.py
class CheckMyApp:
    def simple_check(self):
        pass

    def complex_check(self):
        pass
```

The test collection would look like this:

```bash
$ pytest --collect-only
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
configfile: pytest.ini
collected 2 items

<Dir pythoncollection.rst-201>
 <Module check_myapp.py>
    <Class CheckMyApp>
```

(continues on next page)
You can check for multiple glob patterns by adding a space between the patterns:

```python
# Example 2: have pytest look for files with "test" and "example"
# content of pytest.ini
[pytest]
python_files = test_*.py example_*.py
```

**Note:** the `python_functions` and `python_classes` options has no effect for `unittest.TestCase` test discovery because pytest delegates discovery of test case methods to unittest code.

### Interpreting cmdline arguments as Python packages

You can use the `--pyargs` option to make pytest try interpreting arguments as python package names, deriving their filesystem path and then running the test. For example if you have unittest2 installed you can type:

```
pytest --pyargs unittest2.test.test_skipping -q
```

which would run the respective test module. Like with other options, through an ini-file and the `addopts` option you can make this change more permanently:

```ini
# content of pytest.ini
[pytest]
addopts = --pyargs
```

Now a simple invocation of pytest `NAME` will check if NAME exists as an importable package/module and otherwise treat it as a filesystem path.

### Finding out what is collected

You can always peek at the collection tree without running tests like this:

```
. $ pytest --collect-only pythoncollection.py
=================================================================== test session starts ==
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
configfile: pytest.ini
collected 3 items

<Dir pythoncollection.rst-201>
  <Dir CWD>
    <Module pythoncollection.py>
      <Function test_function>
      <Class TestClass>
        <Function test_method>
        <Function test_anothermethod>

=================================================================== 3 tests collected in 0.12s ==
```
Customizing test collection

You can easily instruct pytest to discover tests from every Python file:

```ini
# content of pytest.ini
[pytest]
python_files = *.py
```

However, many projects will have a `setup.py` which they don’t want to be imported. Moreover, there may files only importable by a specific python version. For such cases you can dynamically define files to be ignored by listing them in a `conftest.py` file:

```python
# content of conftest.py
import sys

collect_ignore = ['setup.py']
if sys.version_info[0] > 2:
    collect_ignore.append('pkg/module_py2.py')
```

and then if you have a module file like this:

```python
# content of pkg/module_py2.py
def test_only_on_python2():
    try:
        assert 0
    except Exception, e:
        pass
```

and a `setup.py` dummy file like this:

```python
# content of setup.py
0 / 0 # will raise exception if imported
```

If you run with a Python 2 interpreter then you will find the one test and will leave out the `setup.py` file:

```
$ pytest --collect-only
======= test session starts ======
platform linux2 -- Python 2.7.10, pytest-2.9.1, py-1.4.31, pluggy-0.3.1
rootdir: $REGENDOC_TMPDIR, inifile: pytest.ini
collected 1 items
<Module 'pkg/module_py2.py'>
 <Function 'test_only_on_python2'>

======= 1 tests found in 0.04 seconds ======
```

If you run with a Python 3 interpreter both the one test and the `setup.py` file will be left out:

```
$ pytest --collect-only
=========================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project
cfgfile: pytest.ini
collected 0 items

======================= no tests collected in 0.12s ========================
```

It’s also possible to ignore files based on Unix shell-style wildcards by adding patterns to `collect_ignore_glob`. 

Chapter 5. Further topics
The following example `conftest.py` ignores the file `setup.py` and in addition all files that end with `*_py2.py` when executed with a Python 3 interpreter:

```python
# content of conftest.py
import sys

collect_ignore = ["setup.py"]
if sys.version_info[0] > 2:
    collect_ignore_glob = ["*_py2.py"]
```

Since Pytest 2.6, users can prevent pytest from discovering classes that start with `Test` by setting a boolean `__test__` attribute to `False`.

```python
# Will not be discovered as a test
class TestClass:
    __test__ = False
```

## 5.1.7 Working with non-python tests

### A basic example for specifying tests in Yaml files

Here is an example `conftest.py` (extracted from Ali Afshar’s special purpose `pytest-yamlwsgi` plugin). This `conftest.py` will collect `test*.yaml` files and will execute the yaml-formatted content as custom tests:

```python
# content of conftest.py
from __future__ import annotations
import pytest

def pytest_collect_file(parent, file_path):
    if file_path.suffix == ".yaml" and file_path.name.startswith("test"):
        return YamlFile.from_parent(parent, path=file_path)

class YamlFile(pytest.File):
    def collect(self):
        # We need a yaml parser, e.g. PyYAML.
        import yaml

        raw = yaml.safe_load(self.path.open(encoding="utf-8"))
        for name, spec in sorted(raw.items()):
            yield YamlItem.from_parent(self, name=name, spec=spec)

class YamlItem(pytest.Item):
    def __init__(self, *, spec, **kwargs):
        super().__init__(**kwargs)
        self.spec = spec

    def runtest(self):
        for name, value in sorted(self.spec.items()):
            # Some custom test execution (dumb example follows).
            if name != value:
                raise YamlException(self, name, value)
```

(continues on next page)
def repr_failure(self, excinfo):
    """Called when self.runtest() raises an exception."""
    if isinstance(excinfo.value, YamlException):
        return "\n        " +
        "usecase execution failed",
        " spec failed: {1!r}: {2!r}": "no further details known at this point.",
    ]
    return super().repr_failure(excinfo)

def reportinfo(self):
    return self.path, 0, f"usecase: {self.name}"

class YamlException(Exception):
    """Custom exception for error reporting."""

You can create a simple example file:

```yaml
# test_simple.yaml
ok:
    sub1: sub1

hello:
    world: world
    some: other
```

and if you installed PyYAML or a compatible YAML-parser you can now execute the test specification:

```
nonpython $ pytest test_simple.yaml
==================================== test session starts ============================
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project/nonpython
collected 2 items
test_simple.yaml F. [100%]

================================== FAILURES ================================
______________________________ usecase: hello _____________________________
usecase execution failed
    spec failed: 'some': 'other'
    no further details known at this point.
------------------------------- short test summary info --------------------------
FAILED test_simple.yaml::hello
---------------------------- 1 failed, 1 passed in 0.12s -------------------------
```

You get one dot for the passing `sub1: sub1` check and one failure. Obviously in the above `conftest.py` you'll want to implement a more interesting interpretation of the yaml-values. You can easily write your own domain specific testing language this way.

**Note:** `repr_failure(excinfo)` is called for representing test failures. If you create custom collection nodes you can return an error representation string of your choice. It will be reported as a (red) string.

`reportinfo()` is used for representing the test location and is also consulted when reporting in verbose mode:
nonpython $ pytest -v
==================================================================== test session starts ============
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y -- $PYTHON_PREFIX/bin/
   → python
cachedir: .pytest_cache
rootdir: /home/sweet/project/nonpython
collecting ... collected 2 items

test_simple.yaml::hello FAILED [ 50%]
test_simple.yaml::ok PASSED [100%]
==================================================================== FAILURES ============
usecase execution failed
   spec failed: 'some': 'other'
   no further details known at this point.
==================================================================== short test summary info ===========
FAILED test_simple.yaml::hello
1 failed, 1 passed in 0.12s

While developing your custom test collection and execution it’s also interesting to just look at the collection tree:

nonpython $ pytest --collect-only
==================================================================== test session starts ============
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project/nonpython
collected 2 items

<Package nonpython>
   <YamlFile test_simple.yaml>
      <YamlItem hello>
      <YamlItem ok>

2 tests collected in 0.12s

5.1.8 Using a custom directory collector

By default, pytest collects directories using pytest.Package, for directories with __init__.py files, and pytest.Dir for other directories. If you want to customize how a directory is collected, you can write your own pytest.Directory collector, and use pytest_collect_directory to hook it up.

A basic example for a directory manifest file

Suppose you want to customize how collection is done on a per-directory basis. Here is an example conftest.py plugin that allows directories to contain a manifest.json file, which defines how the collection should be done for the directory. In this example, only a simple list of files is supported, however you can imagine adding other keys, such as exclusions and globs.

```
# content of conftest.py
from __future__ import annotations

import json

import pytest

(continues on next page)```
class ManifestDirectory(pytest.Directory):
    def collect(self):
        # The standard pytest behavior is to loop over all `test_*.py` files and
        # call `pytest_collect_file` on each file. This collector instead reads
        # the `manifest.json` file and only calls `pytest_collect_file` for the
        # files defined there.
        manifest_path = self.path / "manifest.json"
        manifest = json.loads(manifest_path.read_text(encoding="utf-8"))
        ihook = self.ihook
        for file in manifest["files"]:
            yield from ihook.pytest_collect_file(
                file_path=self.path / file, parent=self
            )

@pytest.hookimpl
def pytest_collect_directory(path, parent):
    # Use our custom collector for directories containing a `manifest.json` file.
    if path.joinpath("manifest.json").is_file():
        return ManifestDirectory.from_parent(parent=parent, path=path)
    # Otherwise fallback to the standard behavior.
    return None

You can create a manifest.json file and some test files:

```json
{
    "files": [
        "test_first.py",
        "test_second.py"
    ]
}
```

# content of test_first.py
from __future__ import annotations

def test_1():
    pass

# content of test_second.py
from __future__ import annotations

def test_2():
    pass

# content of test_third.py
from __future__ import annotations

def test_3():
    pass

An you can now execute the test specification:
Notice how test_three.py was not executed, because it is not listed in the manifest.

You can verify that your custom collector appears in the collection tree:

```
customdirectory $ pytest --collect-only
platform linux -- Python 3.x.y, pytest-8.x.y, pluggy-1.x.y
rootdir: /home/sweet/project/customdirectory
configfile: pytest.ini
collected 2 items
<Dir customdirectory>
  <ManifestDirectory tests>
    <Module test_first.py>
      <Function test_1>
    <Module test_second.py>
      <Function test_2>
```

### 5.2 Backwards Compatibility Policy

Pytest is an actively evolving project that has been decades in the making. We keep learning about new and better structures to express different details about testing.

While we implement those modifications, we try to ensure an easy transition and don’t want to impose unnecessary churn on our users and community/plugin authors.

As of now, pytest considers multiple types of backward compatibility transitions:

a) trivial: APIs that trivially translate to the new mechanism and do not cause problematic changes.

   We try to support those indefinitely while encouraging users to switch to newer or better mechanisms through documentation.

b) transitional: the old and new APIs don’t conflict, and we can help users transition by using warnings while supporting both for a prolonged period of time.

   We will only start the removal of deprecated functionality in major releases (e.g., if we deprecate something in 3.0, we will start to remove it in 4.0), and keep it around for at least two minor releases (e.g., if we deprecate something in 3.9 and 4.0 is the next release, we start to remove it in 5.0, not in 4.0).

   A deprecated feature scheduled to be removed in major version X will use the warning class PytestRemoved-InXWarning (a subclass of PytestDeprecationWarning).
When the deprecation expires (e.g., 4.0 is released), we won’t remove the deprecated functionality immediately but will use the standard warning filters to turn `PytestRemovedInXWarning` (e.g., `PytestRemovedIn4Warning`) into errors by default. This approach makes it explicit that removal is imminent and still gives you time to turn the deprecated feature into a warning instead of an error so it can be dealt with in your own time. In the next minor release (e.g., 4.1), the feature will be effectively removed.

c) True breakages should only be considered when a normal transition is unreasonably unsustainable and would offset important developments or features by years. In addition, they should be limited to APIs where the number of actual users is very small (for example, only impacting some plugins) and can be coordinated with the community in advance.

Examples for such upcoming changes:

- removal of `pytest_runtest_protocol/nextitem` - #895
- rearranging of the node tree to include `FunctionDefinition`
- rearranging of `SetupState` #895

True breakages must be announced first in an issue containing:

- Detailed description of the change
- Rationale
- Expected impact on users and plugin authors (example in #895)

After there’s no hard `-I` on the issue it should be followed up by an initial proof-of-concept Pull Request.

This POC serves as both a coordination point to assess impact and potential inspiration to come up with a transitional solution after all.

After a reasonable amount of time the PR can be merged to base a new major release.

For the PR to mature from POC to acceptance, it must contain: * Setup of deprecation errors/warnings that help users fix and port their code. If it is possible to introduce a deprecation period under the current series, before the true breakage, it should be introduced in a separate PR and be part of the current release stream. * Detailed description of the rationale and examples on how to port code in `doc/en/deprecations.rst`.

## 5.3 History

### 5.3.1 Focus primary on smooth transition - stance (pre 6.0)

Keeping backwards compatibility has a very high priority in the pytest project. Although we have deprecated functionality over the years, most of it is still supported. All deprecations in pytest were done because simpler or more efficient ways of accomplishing the same tasks have emerged, making the old way of doing things unnecessary.

With the pytest 3.0 release, we introduced a clear communication scheme for when we will actually remove the old busted joint and politely ask you to use the new hotness instead, while giving you enough time to adjust your tests or raise concerns if there are valid reasons to keep deprecated functionality around.

To communicate changes, we issue deprecation warnings using a custom warning hierarchy (see `Internal pytest warnings`). These warnings may be suppressed using the standard means: `-W` command-line flag or `filterwarnings.ini` options (see `How to capture warnings`), but we suggest to use these sparingly and temporarily, and heed the warnings when possible.

We will only start the removal of deprecated functionality in major releases (e.g. if we deprecate something in 3.0, we will start to remove it in 4.0), and keep it around for at least two minor releases (e.g. if we deprecate something in 3.9 and 4.0 is the next release, we start to remove it in 5.0, not in 4.0).
When the deprecation expires (e.g. 4.0 is released), we won’t remove the deprecated functionality immediately, but will use the standard warning filters to turn them into errors by default. This approach makes it explicit that removal is imminent, and still gives you time to turn the deprecated feature into a warning instead of an error so it can be dealt with in your own time. In the next minor release (e.g. 4.1), the feature will be effectively removed.

Deprecation Roadmap

Features currently deprecated and removed in previous releases can be found in Deprecations and Removals.

We track future deprecation and removal of features using milestones and the deprecation and removal labels on GitHub.

5.4 Python version support

Released pytest versions support all Python versions that are actively maintained at the time of the release:

<table>
<thead>
<tr>
<th>pytest version</th>
<th>min. Python version</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0+</td>
<td>3.8+</td>
</tr>
<tr>
<td>7.1+</td>
<td>3.7+</td>
</tr>
<tr>
<td>6.2 - 7.0</td>
<td>3.6+</td>
</tr>
<tr>
<td>5.0 - 6.1</td>
<td>3.5+</td>
</tr>
<tr>
<td>3.3 - 4.6</td>
<td>2.7, 3.4+</td>
</tr>
</tbody>
</table>

Status of Python Versions.

5.5 Deprecations and Removals

This page lists all pytest features that are currently deprecated or have been removed in past major releases. The objective is to give users a clear rationale why a certain feature has been removed, and what alternatives should be used instead.

5.5.1 Deprecated Features

Below is a complete list of all pytest features which are considered deprecated. Using those features will issue Pytest-Warning or subclasses, which can be filtered using standard warning filters.

pytest.importorskip default behavior regarding ImportError

Deprecated since version 8.2.

Traditionally pytest.importorskip() will capture ImportError, with the original intent being to skip tests where a dependent module is not installed, for example testing with different dependencies.

However some packages might be installed in the system, but are not importable due to some other issue, for example, a compilation error or a broken installation. In those cases pytest.importorskip() would still silently skip the test, but more often than not users would like to see the unexpected error so the underlying issue can be fixed.

In 8.2 the exc_type parameter has been added, giving users the ability of passing ModuleNotFounedError to skip tests only if the module cannot really be found, and not because of some other error.
Catching only ModuleNotFoundError by default (and letting other errors propagate) would be the best solution, however for backward compatibility, pytest will keep the existing behavior but raise an warning if:

1. The captured exception is of type ImportError, and:
2. The user does not pass exc_type explicitly.

If the import attempt raises ModuleNotFoundError (the usual case), then the module is skipped and no warning is emitted.

This way, the usual cases will keep working the same way, while unexpected errors will now issue a warning, with users being able to suppress the warning by passing exc_type=ImportError explicitly.

In 9.0, the warning will turn into an error, and in 9.1 pytest.importorskip() will only capture ModuleNotFoundError by default and no warnings will be issued anymore – but users can still capture ImportError by passing it to exc_type.

**fspath argument for Node constructors replaced with pathlib.Path**

Deprecated since version 7.0.

In order to support the transition from py.path.local to pathlib, the fspath argument to Node constructors like pytest.Function.from_parent() and pytest.Class.from_parent() is now deprecated.

Plugins which construct nodes should pass the path argument, of type pathlib.Path, instead of the fspath argument.

Plugins which implement custom items and collectors are encouraged to replace fspath parameters (py.path.local) with path parameters (pathlib.Path), and drop any other usage of the py library if possible.

If possible, plugins with custom items should use cooperative constructors to avoid hardcoding arguments they only pass on to the superclass.

---

**Note:** The name of the Node arguments and attributes (the new attribute being path) is the opposite of the situation for hooks, outlined below (the old argument being path).

This is an unfortunate artifact due to historical reasons, which should be resolved in future versions as we slowly get rid of the py dependency (see #9283 for a longer discussion).

Due to the ongoing migration of methods like reportinfo() which still is expected to return a py.path.local object, nodes still have both fspath (py.path.local) and path (pathlib.Path) attributes, no matter what argument was used in the constructor. We expect to deprecate the fspath attribute in a future release.

**Configuring hook specs/impls using markers**

Before pluggy, pytest’s plugin library, was its own package and had a clear API, pytest just used pytest.mark to configure hooks.

The pytest.hookimpl() and pytest.hookspec() decorators have been available since years and should be used instead.

```python
@pytest.mark.tryfirst
def pytest_runtest_call(): ...
```

# or

```python
def pytest_runtest_call(): ...
```

(continues on next page)
pytest runtest_call.tryfirst = True

should be changed to:

```python
@pytest.hookimpl(tryfirst=True)
def pytest_runtest_call(): ...
```

Changed hookimpl attributes:
- tryfirst
- trylast
- optionalhook
- hookwrapper

Changed hookwrapper attributes:
- firstresult
- historic

**py.path.local arguments for hooks replaced with pathlib.Path**

Deprecated since version 7.0.

In order to support the transition from py.path.local to pathlib, the following hooks now receive additional arguments:

- `pytest_ignore_collect(collection_path: pathlib.Path)` as equivalent to `path`  
- `pytest_collect_file(file_path: pathlib.Path)` as equivalent to `path`  
- `pytest_pycollect_makemodule(module_path: pathlib.Path)` as equivalent to `path`  
- `pytest_report_header(start_path: pathlib.Path)` as equivalent to `startdir`  
- `pytest_report_collectionfinish(start_path: pathlib.Path)` as equivalent to `startdir`

The accompanying py.path.local based paths have been deprecated: plugins which manually invoke those hooks should only pass the new pathlib.Path arguments, and users should change their hook implementations to use the new pathlib.Path arguments.

**Note:** The name of the Node arguments and attributes, *outlined above* (the new attribute being path) is the opposite of the situation for hooks (the old argument being path).

This is an unfortunate artifact due to historical reasons, which should be resolved in future versions as we slowly get rid of the py dependency (see #9283 for a longer discussion).
### Directly constructing internal classes

Deprecated since version 7.0.

Directly constructing the following classes is now deprecated:

- `_pytest.mark.structures.Mark`
- `_pytest.mark.structures.MarkDecorator`
- `_pytest.mark.structures.MarkGenerator`
- `_pytest.python.Metafunc`
- `_pytest.runner.CallInfo`
- `_pytest._code.ExceptionInfo`
- `_pytest.config.argparsing.Parser`
- `_pytest.config.argparsing.OptionGroup`
- `_pytest.pytester.HookRecorder`

These constructors have always been considered private, but now issue a deprecation warning, which may become a hard error in pytest 8.

### Diamond inheritance between `pytest.Collector` and `pytest.Item`

Deprecated since version 7.0.

Defining a custom pytest node type which is both an `Item` and a `Collector` (e.g. `File`) now issues a warning. It was never sanely supported and triggers hard to debug errors.

Some plugins providing linting/code analysis have been using this as a hack. Instead, a separate collector node should be used, which collects the item. See `Working with non-python tests` for an example, as well as an example pr fixing inheritance.

### Constructors of custom Node subclasses should take **kwargs

Deprecated since version 7.0.

If custom subclasses of nodes like `pytest.Item` override the `__init__` method, they should take `**kwargs`. Thus,

```python
class CustomItem(pytest.Item):
    def __init__(self, name, parent, additional_arg):
        super().__init__(name, parent)
        self.additional_arg = additional_arg
```

should be turned into:

```python
class CustomItem(pytest.Item):
    def __init__(self, *, additional_arg, **kwargs):
        super().__init__(**kwargs)
        self.additional_arg = additional_arg
```

to avoid hard-coding the arguments pytest can pass to the superclass. See `Working with non-python tests` for a full example.

For cases without conflicts, no deprecation warning is emitted. For cases with conflicts (such as `pytest.File` now taking `path` instead of `fspath`, as outlined above), a deprecation warning is now raised.
Applying a mark to a fixture function

Deprecated since version 7.4.

Applying a mark to a fixture function never had any effect, but it is a common user error.

```python
@ pytest.mark.usefixtures("clean_database")
@ pytest.fixture
def user() -> User: ...
```

Users expected in this case that the `usefixtures` mark would have its intended effect of using the `clean_database` fixture when `user` was invoked, when in fact it has no effect at all.

Now pytest will issue a warning when it encounters this problem, and will raise an error in the future versions.

Returning non-None value in test functions

Deprecated since version 7.2.

A `pytest.PytestReturnNotNoneWarning` is now emitted if a test function returns something other than `None`.

This prevents a common mistake among beginners that expect that returning a `bool` would cause a test to pass or fail, for example:

```python
@ pytest.mark.parametrize(  
    ["a", "b", "result"],  
    [  
        [1, 2, 5],  
        [2, 3, 8],  
        [5, 3, 18],  
    ],  
)
def test_foo(a, b, result):
    return foo(a, b) == result
```

Given that pytest ignores the return value, this might be surprising that it will never fail.

The proper fix is to change the `return` to an `assert`:

```python
@ pytest.mark.parametrize(  
    ["a", "b", "result"],  
    [  
        [1, 2, 5],  
        [2, 3, 8],  
        [5, 3, 18],  
    ],  
)
def test_foo(a, b, result):
    assert foo(a, b) == result
```
The `yield_fixture` function/decorator

Deprecated since version 6.2.

`pytest.yield_fixture` is a deprecated alias for `pytest.fixture()`.

It has been so for a very long time, so can be search/replaced safely.

5.5.2 Removed Features and Breaking Changes

As stated in our Backwards Compatibility Policy policy, deprecated features are removed only in major releases after an appropriate period of deprecation has passed.

Some breaking changes which could not be deprecated are also listed.

Support for tests written for nose

Deprecated since version 7.2.

Removed in version 8.0.

Support for running tests written for `nose` is now deprecated.

`nose` has been in maintenance mode-only for years, and maintaining the plugin is not trivial as it spills over the code base (see #9886 for more details).

setup/teardown

One thing that might catch users by surprise is that plain `setup` and `teardown` methods are not pytest native, they are in fact part of the `nose` support.

```python
class Test:
    def setup(self):
        self.resource = make_resource()

    def teardown(self):
        self.resource.close()

    def test_foo(self): ...

    def test_bar(self): ...
```

Native pytest support uses `setup_method` and `teardown_method` (see Method and function level setup/teardown), so the above should be changed to:

```python
class Test:
    def setup_method(self):
        self.resource = make_resource()

    def teardown_method(self):
        self.resource.close()

    def test_foo(self): ...

    def test_bar(self): ...
```
This is easy to do in an entire code base by doing a simple find/replace.

@with_setup

Code using @with_setup such as this:

```python
from nose.tools import with_setup

def setup_some_resource(): ...

def teardown_some_resource(): ...

@with_setup(setup_some_resource, teardown_some_resource)
def test_foo(): ...
```

Will also need to be ported to a supported pytest style. One way to do it is using a fixture:

```python
import pytest

def setup_some_resource(): ...

def teardown_some_resource(): ...

@pytest.fixture
def some_resource():
    setup_some_resource()
    yield
    teardown_some_resource()

def test_foo(some_resource): ...
```

The compat_co_firstlineno attribute

Nose inspects this attribute on function objects to allow overriding the function's inferred line number. Pytest no longer respects this attribute.

Passing msg= to pytest.skip, pytest.fail or pytest.exit

Deprecated since version 7.0.

Removed in version 8.0.

Passing the keyword argument msg to pytest.skip(), pytest.fail() or pytest.exit() is now deprecated and reason should be used instead. This change is to bring consistency between these functions and the @pytest.mark.skip and @pytest.mark.xfail markers which already accept a reason argument.

5.5. Deprecations and Removals
def test_fail_example():
    # old
    pytest.fail(msg="foo")
    # new
    pytest.fail(reason="bar")

def test_skip_example():
    # old
    pytest.skip(msg="foo")
    # new
    pytest.skip(reason="bar")

def test_exit_example():
    # old
    pytest.exit(msg="foo")
    # new
    pytest.exit(reason="bar")

The pytest.Instance collector

Removed in version 7.0.

The pytest.Instance collector type has been removed.

Previously, Python test methods were collected as Class -> Instance -> Function. Now Class collects the test methods directly.

Most plugins which reference Instance do so in order to ignore or skip it, using a check such as if isinstance(node, Instance): return. Such plugins should simply remove consideration of Instance on pytest>=7. However, to keep such uses working, a dummy type has been instanced in pytest.Instance and _pytest.python.Instance, and importing it emits a deprecation warning. This was removed in pytest 8.

Using pytest.warns(None)

Deprecated since version 7.0.

Removed in version 8.0.

pytest.warns(None) is now deprecated because it was frequently misused. Its correct usage was checking that the code emits at least one warning of any type - like pytest.warns() or pytest.warns(Warning).

See Additional use cases of warnings in tests for examples.

Backward compatibilities in Parser.addoption

Deprecated since version 2.4.

Removed in version 8.0.

Several behaviors of Parser.addoption are now removed in pytest 8 (deprecated since pytest 2.4.0):

- parser.addoption(..., help=".. %default ..") - use %{default}s instead.
- parser.addoption(..., type="int/string/float/complex") - use type=int etc. instead.
The \texttt{--strict} command-line option

Deprecated since version 6.2.

Removed in version 8.0.

The \texttt{--strict} command-line option has been deprecated in favor of \texttt{--strict-markers}, which better conveys what the option does.

We have plans to maybe in the future to reintroduce \texttt{--strict} and make it an encompassing flag for all strictness related options (\texttt{--strict-markers} and \texttt{--strict-config} at the moment, more might be introduced in the future).

Implementing the \texttt{pytest_cmdline_preparse} hook

Deprecated since version 7.0.

Removed in version 8.0.

Implementing the \texttt{pytest_cmdline_preparse} hook has been officially deprecated. Implement the \texttt{pytest_load_initial_conftests} hook instead.

```python
def pytest_cmdline_preparse(config: Config, args: List[str]) -> None: ...

# becomes:

def pytest_load_initial_conftests(
    early_config: Config, parser: Parser, args: List[str]
) -> None: ...
```

Collection changes in pytest 8

Added a new \texttt{pytest.Directory} base collection node, which all collector nodes for filesystem directories are expected to subclass. This is analogous to the existing \texttt{pytest.File} for file nodes.

Changed \texttt{pytest.Package} to be a subclass of \texttt{pytest.Directory}. A Package represents a filesystem directory which is a Python package, i.e. contains an \texttt{__init__.py} file.

\texttt{pytest.Package} now only collects files in its own directory; previously it collected recursively. Sub-directories are collected as sub-collector nodes, thus creating a collection tree which mirrors the filesystem hierarchy.

\texttt{session.name} is now ";"; previously it was the rootdir directory name. This matches \texttt{session.nodeid} which has always been ";".

Added a new \texttt{pytest.Dir} concrete collection node, a subclass of \texttt{pytest.Directory}. This node represents a filesystem directory, which is not a \texttt{pytest.Package}, i.e. does not contain an \texttt{__init__.py} file. Similarly to Package, it only collects the files in its own directory, while collecting sub-directories as sub-collector nodes.

Files and directories are now collected in alphabetical order jointly, unless changed by a plugin. Previously, files were collected before directories.

The collection tree now contains directories/packages up to the \texttt{rootdir}, for initial arguments that are found within the rootdir. For files outside the rootdir, only the immediate directory/package is collected – note however that collecting from outside the rootdir is discouraged.

As an example, given the following filesystem tree:
the collection tree, as shown by `pytest --collect-only top/` but with the otherwise-hidden `Session` node added for clarity, is now the following:

Previously, it was:

Code/plugins which rely on a specific shape of the collection tree might need to update.
pytest Documentation, Release 8.3

pytest.Package is no longer a pytest.Module or pytest.File

Changed in version 8.0.

The Package collector node designates a Python package, that is, a directory with an __init__.py file. Previously Package was a subtype of pytest.Module (which represents a single Python module), the module being the __init__.py file. This has been deemed a design mistake (see #11137 and #7777 for details).

The path property of Package nodes now points to the package directory instead of the __init__.py file.

Note that a Module node for __init__.py (which is not a Package) may still exist, if it is picked up during collection (e.g. if you configured python_files to include __init__.py files).

Collecting __init__.py files no longer collects package

Removed in version 8.0.

Running pytest pkg/__init__.py now collects the pkg/__init__.py file (module) only. Previously, it collected the entire pkg package, including other test files in the directory, but excluding tests in the __init__.py file itself (unless python_files was changed to allow __init__.py file).

To collect the entire package, specify just the directory: pytest pkg.

The pytest.collect module

Deprecated since version 6.0.

Removed in version 7.0.

The pytest.collect module is no longer part of the public API, all its names should now be imported from pytest directly instead.

The pytest_warning_captured hook

Deprecated since version 6.0.

Removed in version 7.0.

This hook has an item parameter which cannot be serialized by pytest-xdist.

Use the pytest_warning_recorded hook instead, which replaces the item parameter by a nodeid parameter.

The pytest._fillfuncargs function

Deprecated since version 6.0.

Removed in version 7.0.

This function was kept for backward compatibility with an older plugin.

It's functionality is not meant to be used directly, but if you must replace it, use function._request._fillfixtures() instead, though note this is not a public API and may break in the future.

5.5. Deprecations and Removals 445
**--no-print-logs command-line option**

Deprecated since version 5.4.

Removed in version 6.0.

The `--no-print-logs` option and `log_print` ini setting are removed. If you used them, please use `--show-capture` instead.

A `--show-capture` command-line option was added in pytest 3.5.0 which allows to specify how to display captured output when tests fail: `no, stdout, stderr, log` or `all` (the default).

**Result log (--result-log)**

Deprecated since version 4.0.

Removed in version 6.0.

The `--result-log` option produces a stream of test reports which can be analysed at runtime, but it uses a custom format which requires users to implement their own parser.

The pytest-reportlog plugin provides a `--report-log` option, a more standard and extensible alternative, producing one JSON object per-line, and should cover the same use cases. Please try it out and provide feedback.

The pytest-reportlog plugin might even be merged into the core at some point, depending on the plans for the plugins and number of users using it.

**pytest_collect_directory hook**

Removed in version 6.0.

The `pytest_collect_directory` hook has not worked properly for years (it was called but the results were ignored). Users may consider using `pytest_collection_modifyitems` instead.

**TerminalReporter.writer**

Removed in version 6.0.

The `TerminalReporter.writer` attribute has been deprecated and should no longer be used. This was inadvertently exposed as part of the public API of that plugin and ties it too much with `py.io.TerminalWriter`.

Plugins that used `TerminalReporter.writer` directly should instead use `TerminalReporter` methods that provide the same functionality.

**junit_family default value change to “xunit2”**

Changed in version 6.0.

The default value of `junit_family` option will change to `xunit2` in pytest 6.0, which is an update of the old `xunit1` format and is supported by default in modern tools that manipulate this type of file (for example, Jenkins, Azure Pipelines, etc.).

Users are recommended to try the new `xunit2` format and see if their tooling that consumes the JUnit XML file supports it.

To use the new format, update your `pytest.ini`:
If you discover that your tooling does not support the new format, and want to keep using the legacy version, set the option to `legacy` instead:

```
[pytest]
junit_family=legacy
```

By using `legacy` you will keep using the legacy/xunit1 format when upgrading to pytest 6.0, where the default format will be `xunit2`.

In order to let users know about the transition, pytest will issue a warning in case the `--junit-xml` option is given in the command line but `junit_family` is not explicitly configured in `pytest.ini`.

Services known to support the `xunit2` format:

- Jenkins with the JUnit plugin.
- Azure Pipelines.

**Node Construction changed to Node.from_parent**

Changed in version 6.0.

The construction of nodes now should use the named constructor `from_parent`. This limitation in api surface intends to enable better/simpler refactoring of the collection tree.

This means that instead of `MyItem(name="foo", parent=collector, obj=42)` one now has to invoke `MyItem.from_parent(collector, name="foo")`.

Plugins that wish to support older versions of pytest and suppress the warning can use `hasattr` to check if `from_parent` exists in that version:

```python
def pytest_pycollect_makeitem(collector, name, obj):
    if hasattr(MyItem, "from_parent"):
        item = MyItem.from_parent(collector, name="foo")
        item.obj = 42
        return item
    else:
        return MyItem(name="foo", parent=collector, obj=42)
```

Note that `from_parent` should only be called with keyword arguments for the parameters.

**pytest.fixture arguments are keyword only**

Removed in version 6.0.

Passing arguments to `pytest.fixture()` as positional arguments has been removed - pass them by keyword instead.
funcargnames alias for fixturenames

Removed in version 6.0.

The FixtureRequest, Metafunc, and Function classes track the names of their associated fixtures, with the aptly-named fixturenames attribute.

Prior to pytest 2.3, this attribute was named funcargnames, and we have kept that as an alias since. It is finally due for removal, as it is often confusing in places where we or plugin authors must distinguish between fixture names and names supplied by non-fixture things such as pytest.mark.parametrized.

pytest.config global

Removed in version 5.0.

The pytest.config global object is deprecated. Instead use request.config (via the request fixture) or if you are a plugin author use the pytest_configure(config) hook. Note that many hooks can also access the config object indirectly, through session.config or item.config for example.

"message" parameter of pytest.raises

Removed in version 5.0.

It is a common mistake to think this parameter will match the exception message, while in fact it only serves to provide a custom message in case the pytest.raises check fails. To prevent users from making this mistake, and because it is believed to be little used, pytest is deprecating it without providing an alternative for the moment.

If you have a valid use case for this parameter, consider that to obtain the same results you can just call pytest.fail manually at the end of the with statement.

For example:

```python
with pytest.raises(TimeoutError, message="Client got unexpected message"):
    wait_for(websocket.recv(), 0.5)
```

 Becomes:

```python
with pytest.raises(TimeoutError):
    wait_for(websocket.recv(), 0.5)
    pytest.fail("Client got unexpected message")
```

If you still have concerns about this deprecation and future removal, please comment on #3974.

raises / warns with a string as the second argument

Removed in version 5.0.

Use the context manager form of these instead. When necessary, invoke exec directly.

Example:

```python
pytest.raises(ZeroDivisionError, "1 / 0")
pytest.raises(SyntaxError, "a $ b")
pytest.warns(DeprecationWarning, "my_function()")
pytest.warns(SyntaxWarning, "assert(1, 2)"
```
Becomes:

```python
with pytest.raises(ZeroDivisionError):
    1 / 0
with pytest.raises(SyntaxError):
    exec("a $ b")  # exec is required for invalid syntax

with pytest.warns(DeprecationWarning):
    my_function()
with pytest.warns(SyntaxWarning):
    exec(\"assert(1, 2)\")  # exec is used to avoid a top-level warning
```

**Using `Class` in custom Collectors**

Removed in version 4.0.

Using objects named "Class" as a way to customize the type of nodes that are collected in Collector subclasses has been deprecated. Users instead should use `pytest_pycollect_makeitem` to customize node types during collection.

This issue should affect only advanced plugins who create new collection types, so if you see this warning message please contact the authors so they can change the code.

**marks in `pytest.mark.parametrize`**

Removed in version 4.0.

Applying marks to values of a `pytest.mark.parametrize` call is now deprecated. For example:

```python
@_pytest.mark.parametrize(
    "a, b",
    [
        (3, 9),
        pytest.mark.xfail(reason="flaky") (6, 36),
        (10, 100),
        (20, 200),
        (40, 400),
        (50, 500),
    ],
)
def test_foo(a, b): ...
```

This code applies the `pytest.mark.xfail(reason="flaky")` mark to the (6, 36) value of the above parametrization call.

This was considered hard to read and understand, and also its implementation presented problems to the code preventing further internal improvements in the marks architecture.

To update the code, use `pytest.param`:

```python
@_pytest.mark.parametrize(
    "a, b",
    [
        (3, 9),
        pytest.param(6, 36, marks=pytest.mark.xfail(reason="flaky")),
        (10, 100),
    ],
)
def test_foo(a, b): ...
```

(continues on next page)
def test_foo(a, b):
    ...

pytest_funcarg__ prefix

Removed in version 4.0.

In very early pytest versions fixtures could be defined using the `pytest_funcarg__` prefix:

```python
def pytest_funcarg__data():
    return SomeData()
```

Switch over to the `@pytest.fixture` decorator:

```python
@ pytest.fixture
def data():
    return SomeData()
```

[pytest] section in setup.cfg files

Removed in version 4.0.

[pytest] sections in `setup.cfg` files should now be named `[tool:pytest]` to avoid conflicts with other distutils commands.

Metafunc.addcall

Removed in version 4.0.

`Metafunc.addcall` was a precursor to the current parametrized mechanism. Users should use `pytest.Metafunc.parametrize()` instead.

Example:

```python
def pytest_generate_tests(metafunc):
    metafunc.addcall({"i": 1}, id="1")
    metafunc.addcall({"i": 2}, id="2")
```

Becomes:

```python
def pytest_generate_tests(metafunc):
    metafunc.parametrize("i", [1, 2], ids=["1", "2"])
```
cached_setup

Removed in version 4.0.

request.cached_setup was the precursor of the setup/teardown mechanism available to fixtures.

Example:

```python
@pytest.fixture
def db_session():
    return request.cached_setup(
        setup=Session.create, teardown=lambda session: session.close(), scope="module"
    )
```

This should be updated to make use of standard fixture mechanisms:

```python
@ pytest. fixture (scope="module")
def db_session():
    session = Session.create()
    yield session
    session.close()
```

You can consult funcarg comparison section in the docs for more information.

pytest_plugins in non-top-level conftest files

Removed in version 4.0.

Defining pytest_plugins is now deprecated in non-top-level conftest.py files because they will activate referenced plugins globally, which is surprising because for all other pytest features conftest.py files are only active for tests at or below it.

Config.warn and Node.warn

Removed in version 4.0.

Those methods were part of the internal pytest warnings system, but since 3.8 pytest is using the builtin warning system for its own warnings, so those two functions are now deprecated.

Config.warn should be replaced by calls to the standard warnings.warn, example:

```python
config.warn("C1", "some warning")
```

Becomes:

```python
warnings.warn(pytest.PytestWarning("some warning"))
```

Node.warn now supports two signatures:

- node.warn(PytestWarning("some message")): is now the recommended way to call this function. The warning instance must be a PytestWarning or subclass.

- node.warn("CI", "some message"): this code/message form has been removed and should be converted to the warning instance form above.
record_xml_property

Removed in version 4.0.

The `record_xml_property` fixture is now deprecated in favor of the more generic `record_property`, which can be used by other consumers (for example pytest-html) to obtain custom information about the test run.

This is just a matter of renaming the fixture as the API is the same:

```python
def test_foo(record_xml_property): ...
```

Change to:

```python
def test_foo(record_property): ...
```

Passing command-line string to `pytest.main()`

Removed in version 4.0.

Passing a command-line string to `pytest.main()` is deprecated:

```bash
pytest.main("-v -s")
```

Pass a list instead:

```bash
pytest.main(["-v", "-s"])
```

By passing a string, users expect that pytest will interpret that command-line using the shell rules they are working on (for example bash or Powershell), but this is very hard/impossible to do in a portable way.

Calling fixtures directly

Removed in version 4.0.

Calling a fixture function directly, as opposed to request them in a test function, is deprecated.

For example:

```python
@ pytest.fixture
def cell():
    return ...

@ pytest.fixture
def full_cell():
    cell = cell()
    cell.make_full()
    return cell
```

This is a great source of confusion to new users, which will often call the fixture functions and request them from test functions interchangeably, which breaks the fixture resolution model.

In those cases just request the function directly in the dependent fixture:
@pytest.fixture
def cell():
    return ...

@ pytest.fixture
def full_cell(cell):
    cell.make_full()
    return cell

Alternatively if the fixture function is called multiple times inside a test (making it hard to apply the above pattern) or if you would like to make minimal changes to the code, you can create a fixture which calls the original function together with the name parameter:

def cell():
    return ...

@ pytest.fixture(name="cell")
def cell_fixture():
    return cell()

yield tests

Removed in version 4.0.

pytest supported yield-style tests, where a test function actually yield functions and values that are then turned into proper test methods. Example:

def check(x, y):
    assert x**x == y

def test_squared():
    yield check, 2, 4
    yield check, 3, 9

This would result into two actual test functions being generated.

This form of test function doesn’t support fixtures properly, and users should switch to pytest.mark.parametrize:

@ pytest.mark.parametrize("x, y", [(2, 4), (3, 9)])
def test_squared(x, y):
    assert x**x == y

Internal classes accessed through Node

Removed in version 4.0.

Access of Module, Function, Class, Instance, File and Item through Node instances now issue this warning:

usage of Function.Module is deprecated, please use pytest.Module instead

Users should just import pytest and access those objects using the pytest module.

This has been documented as deprecated for years, but only now we are actually emitting deprecation warnings.
Untagged text
5.6.1 Feature requests and feedback

Do you like pytest? Share some love on Twitter or in your blog posts!

We'd also like to hear about your propositions and suggestions. Feel free to submit them as issues and:

- Explain in detail how they should work.
- Keep the scope as narrow as possible. This will make it easier to implement.

5.6.2 Report bugs

Report bugs for pytest in the issue tracker.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting, specifically the Python interpreter version, installed libraries, and pytest version.
- Detailed steps to reproduce the bug.

If you can write a demonstration test that currently fails but should pass (xfail), that is a very useful commit to make as well, even if you cannot fix the bug itself.

5.6.3 Fix bugs

Look through the GitHub issues for bugs. See also the “good first issue” issues that are friendly to new contributors.

Talk to developers to find out how you can fix specific bugs. To indicate that you are going to work on a particular issue, add a comment to that effect on the specific issue.

Don't forget to check the issue trackers of your favourite plugins, too!

5.6.4 Implement features

Look through the GitHub issues for enhancements.

Talk to developers to find out how you can implement specific features.

5.6.5 Write documentation

Pytest could always use more documentation. What exactly is needed?

- More complementary documentation. Have you perhaps found something unclear?
- Documentation translations. We currently have only English.
- Docstrings. There can never be too many of them.
- Blog posts, articles and such – they're all very appreciated.

You can also edit documentation files directly in the GitHub web interface, without using a local copy. This can be convenient for small fixes.

Note: Build the documentation locally with the following command:
$ tox -e docs

The built documentation should be available in `doc/en/_build/html`, where 'en' refers to the documentation language.

Pytest has an API reference which in large part is generated automatically from the docstrings of the documented items. Pytest uses the Sphinx docstring format. For example:

```python
def my_function(arg: ArgType) -> Foo:
    """Do important stuff.
    More detailed info here, in separate paragraphs from the subject line. Use proper sentences -- start sentences with capital letters and end with periods.
    Can include annotated documentation:
    :param short_arg: An argument which determines stuff.
    :param long_arg:
        A long explanation which spans multiple lines, overflows like this.
    :returns: The result.
    :raises ValueError:
        Detailed information when this can happen.
    .. versionadded:: 6.0
    Including types into the annotations above is not necessary when
type-hinting is being used (as in this example).
    """
```

## 5.6.6 Submitting Plugins to pytest-dev

Development of the pytest core, support code, and some plugins happens in repositories living under the `pytest-dev` organisations:

- **pytest-dev on GitHub**

All pytest-dev Contributors team members have write access to all contained repositories. Pytest core and plugins are generally developed using pull requests to respective repositories.

The objectives of the pytest-dev organisation are:

- Having a central location for popular pytest plugins
- Sharing some of the maintenance responsibility (in case a maintainer no longer wishes to maintain a plugin)

You can submit your plugin by subscribing to the pytest-dev mail list and writing a mail pointing to your existing pytest plugin repository which must have the following:

- PyPI presence with packaging metadata that contains a pytest- prefixed name, version number, authors, short and long description.
- A tox configuration for running tests using tox.
- A README describing how to use the plugin and on which platforms it runs.
- A LICENSE file containing the licensing information, with matching info in its packaging metadata.
• an issue tracker for bug reports and enhancement requests.
• a changelog.

If no contributor strongly objects and two agree, the repository can then be transferred to the pytest-dev organisation. Here’s a rundown of how a repository transfer usually proceeds (using a repository named joedoe/pytest-xyz as example):

• joedoe transfers repository ownership to pytest-dev administrator calvin.
• calvin creates pytest-xyz-admin and pytest-xyz-developers teams, inviting joedoe to both as maintainer.
• calvin transfers repository to pytest-dev and configures team access:
  - pytest-xyz-admin admin access;
  - pytest-xyz-developers write access;

The pytest-dev/Contributors team has write access to all projects, and every project administrator is in it. We recommend that each plugin has at least three people who have the right to release to PyPI.

Repository owners can rest assured that no pytest-dev administrator will ever make releases of your repository or take ownership in any way, except in rare cases where someone becomes unresponsive after months of contact attempts. As stated, the objective is to share maintenance and avoid “plugin-abandon”.

### 5.6.7 Preparing Pull Requests

**Short version**

1. Fork the repository.
2. Fetch tags from upstream if necessary (if you cloned only main git fetch --tags https://github.com/pytest-dev/pytest).
3. Enable and install pre-commit to ensure style-guides and code checks are followed.
4. Follow PEP-8 for naming.
5. Tests are run using tox:

   ```bash
   tox -e linting,py39
   ```

   The test environments above are usually enough to cover most cases locally.
6. Write a changelog entry: changelog/2574.bugfix.rst, use issue id number and one of feature, improvement, bugfix, doc, deprecation, breaking, vendor or trivial for the issue type.
7. Unless your change is a trivial or a documentation fix (e.g., a typo or reword of a small section) please add yourself to the AUTHORS file, in alphabetical order.
**Long version**

What is a “pull request”? It informs the project’s core developers about the changes you want to review and merge. Pull requests are stored on GitHub servers. Once you send a pull request, we can discuss its potential modifications and even add more commits to it later on. There’s an excellent tutorial on how Pull Requests work in the GitHub Help Center.

Here is a simple overview, with pytest-specific bits:

1. Fork the pytest GitHub repository. It’s fine to use `pytest` as your fork repository name because it will live under your user.

2. Clone your fork locally using `git` and create a branch:

   ```bash
   $ git clone git@github.com:YOUR_GITHUB_USERNAME/pytest.git
   $ cd pytest
   $ git fetch --tags https://github.com/pytest-dev/pytest
   # now, create your own branch off "main":
   $ git checkout -b your-bugfix-branch-name main
   ```

   Given we have “major.minor.micro” version numbers, bug fixes will usually be released in micro releases whereas features will be released in minor releases and incompatible changes in major releases.

   You will need the tags to test locally, so be sure you have the tags from the main repository. If you suspect you don’t, set the main repository as upstream and fetch the tags:

   ```bash
   $ git remote add upstream https://github.com/pytest-dev/pytest
   $ git fetch upstream --tags
   ```

   If you need some help with Git, follow this quick start guide: https://git.wiki.kernel.org/index.php/QuickStart

3. Install pre-commit and its hook on the pytest repo:

   ```bash
   $ pip install --user pre-commit
   $ pre-commit install
   ```

   Afterwards `pre-commit` will run whenever you commit.

   https://pre-commit.com/ is a framework for managing and maintaining multi-language pre-commit hooks to ensure code-style and code formatting is consistent.

4. Install tox

   Tox is used to run all the tests and will automatically setup virtualenvs to run the tests in. (will implicitly use https://virtualenv.pypa.io/en/latest/):

   ```bash
   $ pip install tox
   ```

5. Run all the tests

   You need to have Python 3.8 or later available in your system. Now running tests is as simple as issuing this command:

   ```bash
   $ tox -e linting,py39
   ```

   This command will run tests via the “tox” tool against Python 3.9 and also perform “lint” coding-style checks.

6. You can now edit your local working copy and run the tests again as necessary. Please follow PEP-8 for naming.

   You can pass different options to `tox`. For example, to run tests on Python 3.9 and pass options to `pytest` (e.g. enter `pdir` on failure) to `pytest` you can do:
$ tox -e py39 -- --pdb

Or to only run tests in a particular test module on Python 3.9:

$ tox -e py39 -- testing/test_config.py

When committing, `pre-commit` will re-format the files if necessary.

7. If instead of using `tox` you prefer to run the tests directly, then we suggest to create a virtual environment and use an editable install with the `dev` extra:

```bash
$ python3 -m venv .venv
$ source .venv/bin/activate  # Linux
$ .venv/Scripts/activate.bat  # Windows
$ pip install -e ".[dev]"
```

Afterwards, you can edit the files and run pytest normally:

```bash
$ pytest testing/test_config.py
```

8. Create a new changelog entry in `changelog`. The file should be named `<issueid>.<type>.rst`, where `issueid` is the number of the issue related to the change and `type` is one of `feature`, `improvement`, `bugfix`, `doc`, `deprecation`, `breaking`, `vendor` or `trivial`. You may skip creating the changelog entry if the change doesn’t affect the documented behaviour of pytest.

9. Add yourself to `AUTHORS` file if not there yet, in alphabetical order.

10. Commit and push once your tests pass and you are happy with your change(s):

```bash
$ git commit -a -m "<commit message>"
$ git push -u
```

11. Finally, submit a pull request through the GitHub website using this data:

```
head-fork: YOUR_GITHUB_USERNAME/pytest
compare: your-branch-name
base-fork: pytest-dev/pytest
base: main
```

### Writing Tests

Writing tests for plugins or for pytest itself is often done using the `pytester` fixture, as a “black-box” test.

For example, to ensure a simple test passes you can write:

```python
def test_true_assertion(pytester):
    pytester.makepyfile(
        """""""test_foo():
            assert True
        """
    )
    result = pytester.runpytest()
    result.assert_outcomes(failed=0, passed=1)
```

Alternatively, it is possible to make checks based on the actual output of the terminal using `glob-like` expressions:
When choosing a file where to write a new test, take a look at the existing files and see if there's one file which looks like a good fit. For example, a regression test about a bug in the --lf option should go into test_cacheprovider.py, given that this option is implemented in cacheprovider.py. If in doubt, go ahead and open a PR with your best guess and we can discuss this over the code.

5.6.8 Joining the Development Team

Anyone who has successfully seen through a pull request which did not require any extra work from the development team to merge will themselves gain commit access if they so wish (if we forget to ask please send a friendly reminder). This does not mean there is any change in your contribution workflow: everyone goes through the same pull-request-and-review process and no-one merges their own pull requests unless already approved. It does however mean you can participate in the development process more fully since you can merge pull requests from other contributors yourself after having reviewed them.

5.6.9 Backporting bug fixes for the next patch release

Pytest makes a feature release every few weeks or months. In between, patch releases are made to the previous feature release, containing bug fixes only. The bug fixes usually fix regressions, but may be any change that should reach users before the next feature release.

Suppose for example that the latest release was 1.2.3, and you want to include a bug fix in 1.2.4 (check https://github.com/pytest-dev/pytest/releases for the actual latest release). The procedure for this is:

1. First, make sure the bug is fixed in the main branch, with a regular pull request, as described above. An exception to this is if the bug fix is not applicable to main anymore.

Automatic method:

Add a backport 1.2.x label to the PR you want to backport. This will create a backport PR against the 1.2.x branch.

Manual method:

1. git checkout origin/1.2.x -b backport-XXXX # use the main PR number here
2. Locate the merge commit on the PR, in the merged message, for example:
   nicodemius merged commit 0f8b462 into pytest-dev:main
3. git cherry-pick -x -m1 REVISION # use the revision you found above (0f8b462).
4. Open a PR targeting 1.2.x:
   - Prefix the message with [1.2.x].
   - Delete the PR body, it usually contains a duplicate commit message.
Who does the backporting

As mentioned above, bugs should first be fixed on `main` (except in rare occasions that a bug only happens in a previous release). So, who should do the backport procedure described above?

1. If the bug was fixed by a core developer, it is the main responsibility of that core developer to do the backport.

2. However, often the merge is done by another maintainer, in which case it is nice of them to do the backport procedure if they have the time.

3. For bugs submitted by non-maintainers, it is expected that a core developer will do the backport, normally the one that merged the PR on `main`.

4. If a non-maintainer notices a bug which is fixed on `main` but has not been backported (due to maintainers forgetting to apply the `needs backport` label, or just plain missing it), they are also welcome to open a PR with the backport. The procedure is simple and really helps with the maintenance of the project.

All the above are not rules, but merely some guidelines/suggestions on what we should expect about backports.

### 5.6.10 Handling stale issues/PRs

Stale issues/PRs are those where pytest contributors have asked for questions/changes and the authors didn’t get around to answer/implement them yet after a somewhat long time, or the discussion simply died because people seemed to lose interest.

There are many reasons why people don't answer questions or implement requested changes: they might get busy, lose interest, or just forget about it, but the fact is that this is very common in open source software.

The pytest team really appreciates every issue and pull request, but being a high-volume project with many issues and pull requests being submitted daily, we try to reduce the number of stale issues and PRs by regularly closing them. When an issue/pull request is closed in this manner, it is by no means a dismissal of the topic being tackled by the issue/pull request, but it is just a way for us to clear up the queue and make the maintainers’ work more manageable. Submitters can always reopen the issue/pull request in their own time later if it makes sense.

#### When to close

Here are a few general rules the maintainers use deciding when to close issues/PRs because of lack of inactivity:

- **Issues labeled question or needs information**: closed after 14 days inactive.
- **Issues labeled proposal**: closed after six months inactive.
- **Pull requests**: after one month, consider pinging the author, update linked issue, or consider closing. For pull requests which are nearly finished, the team should consider finishing it up and merging it.

The above are not hard rules, but merely guidelines, and can be (and often are!) reviewed on a case-by-case basis.

#### Closing pull requests

When closing a Pull Request, it needs to be acknowledging the time, effort, and interest demonstrated by the person which submitted it. As mentioned previously, it is not the intent of the team to dismiss a stalled pull request entirely but to merely to clear up our queue, so a message like the one below is warranted when closing a pull request that went stale:

```
Hi <contributor>,

First of all, we would like to thank you for your time and effort on working on this, the pytest team deeply appreciates it.
```
We noticed it has been awhile since you have updated this PR, however. pytest is a high activity project, with many issues/PRs being opened daily, so it is hard for us maintainers to track which PRs are ready for merging, for review, or need more attention.

So for those reasons we, think it is best to close the PR for now, but with the only intention to clean up our queue, it is by no means a rejection of your changes. We still encourage you to re-open this PR (it is just a click of a button away) when you are ready to get back to it.

Again we appreciate your time for working on this, and hope you might get back to this at a later time!

<bye>

5.6.11 Closing Issues

When a pull request is submitted to fix an issue, add text like `closes #XYZW` to the PR description and/or commits (where `#XYZW` is the issue number). See the GitHub docs for more information.

When an issue is due to user error (e.g. misunderstanding of a functionality), please politely explain to the user why the issue raised is really a non-issue and ask them to close the issue if they have no further questions. If the original requestor is unresponsive, the issue will be handled as described in the section `Handling stale issues/PRs` above.

5.7 Development Guide

The contributing guidelines are to be found [here](#). The release procedure for pytest is documented on GitHub.

5.8 Sponsor

pytest is maintained by a team of volunteers from all around the world in their free time. While we work on pytest because we love the project and use it daily at our daily jobs, monetary compensation when possible is welcome to justify time away from friends, family and personal time.

Money is also used to fund local sprints, merchandising (stickers to distribute in conferences for example) and every few years a large sprint involving all members.

5.8.1 OpenCollective

Open Collective is an online funding platform for open and transparent communities. It provide tools to raise money and share your finances in full transparency.

It is the platform of choice for individuals and companies that want to make one-time or monthly donations directly to the project.

See more details in the pytest collective.
5.9 pytest for enterprise

Tidelift is working with the maintainers of pytest and thousands of other open source projects to deliver commercial support and maintenance for the open source dependencies you use to build your applications. Save time, reduce risk, and improve code health, while paying the maintainers of the exact dependencies you use.

Get more details

The Tidelift Subscription is a managed open source subscription for application dependencies covering millions of open source projects across JavaScript, Python, Java, PHP, Ruby, .NET, and more.

Your subscription includes:

- **Security updates**
  - Tidelift's security response team coordinates patches for new breaking security vulnerabilities and alerts immediately through a private channel, so your software supply chain is always secure.

- **Licensing verification and indemnification**
  - Tidelift verifies license information to enable easy policy enforcement and adds intellectual property indemnification to cover creators and users in case something goes wrong. You always have a 100% up-to-date bill of materials for your dependencies to share with your legal team, customers, or partners.

- **Maintenance and code improvement**
  - Tidelift ensures the software you rely on keeps working as long as you need it to work. Your managed dependencies are actively maintained and we recruit additional maintainers where required.

- **Package selection and version guidance**
  - Tidelift helps you choose the best open source packages from the start—and then guide you through updates to stay on the best releases as new issues arise.

- **Roadmap input**
  - Take a seat at the table with the creators behind the software you use. Tidelift's participating maintainers earn more income as their software is used by more subscribers, so they're interested in knowing what you need.

- **Tooling and cloud integration**
  - Tidelift works with GitHub, GitLab, BitBucket, and every cloud platform (and other deployment targets, too).

The end result? All of the capabilities you expect from commercial-grade software, for the full breadth of open source you use. That means less time grappling with esoteric open source trivia, and more time building your own applications—and your business.

5.11 Contact channels

- pytest issue tracker to report bugs or suggest features (for version 2.0 and above).
- pytest discussions at github for general questions.
- pytest discord server for pytest development visibility and general assistance.
- pytest on stackoverflow.com to post precise questions with the tag pytest. New Questions will usually be seen by pytest users or developers and answered quickly.
- Testing In Python: a mailing list for Python testing tools and discussion.
- pytest-dev at python.org (mailing list) pytest specific announcements and discussions.
- contribution guide for help on submitting pull requests to GitHub.
- #pytest on irc.libera.chat IRC channel for random questions (using an IRC client, or via webchat <https://web.libera.chat/#pytest>)

5.12 History

pytest has a long and interesting history. The first commit in this repository is from January 2007, and even that commit alone already tells a lot: The repository originally was from the py library (later split off to pytest), and it originally was a SVN revision, migrated to Mercurial, and finally migrated to git.

However, the commit says “create the new development trunk” and is already quite big: 435 files changed, 58640 insertions(+). This is because pytest originally was born as part of PyPy, to make it easier to write tests for it. Here's how it evolved from there to its own project:

- Late 2002 / early 2003, PyPy was born.
- Like that blog post mentioned, from very early on, there was a big focus on testing. There were various testsupport files on top of unittest.py, and as early as June 2003, Holger Krekel (@hpk42) refactored its test framework to clean things up (pypy.tool.test, but still on top of unittest.py, with nothing pytest-like yet).
- In December 2003, there was another iteration at improving their testing situation, by Stefan Schwarzer, called pypy.tool.newtest.
• However, it didn’t seem to be around for long, as around June/July 2004, efforts started on a thing called uetest, offering plain assertions. This seems like the start of something pytest-like, but unfortunately, it’s unclear where the test runner’s code was at the time. The closest thing still around is this file, but that doesn’t seem like a complete test runner at all. What can be seen is that there were various efforts by Laura Creighton and Samuele Pedroni (@pedronis) at automatically converting existing tests to the new uetest framework.

• Around the same time, for Europython 2004, @hpk42 started a project originally called “std”, intended to be a “complementary standard library” - already laying out the principles behind what later became pytest:
  – current “batteries included” are very useful, but
    • some of them are written in a pretty much java-like style, especially the unittest-framework
    • […]
    • the best API is one that doesn’t exist
  […]
  – a testing package should require as few boilerplate code as possible and offer much flexibility
  – it should provide premium quality tracebacks and debugging aid
  […]
  – first of all … forget about limited “assertXYZ APIs” and use the real thing, e.g.:

  ```python
  assert x == y
  ```
  – this works with plain python but you get unhelpful “assertion failed” errors with no information
  – std.utest (magic!) actually reinterprets the assertion expression and offers detailed information about underlying values

• In September 2004, the py-dev mailinglist gets born, which is now pytest-dev, but thankfully with all the original archives still intact.

• Around September/October 2004, the std project was renamed to py and std.utest became py.test. This is also the first time the entire source code, seems to be available, with much of the API still being around today:
  – py.path.local, which is being phased out of pytest (in favour of pathlib) some 16-17 years later
  – The idea of the collection tree, including Collector, FSCollector, Directory, PyCollector, Module, Class
  – Arguments like --exitfirst, --showlocals, --fulltrace, --pdb, -S/--nocapture (-s/--capture=off today), --collectonly (--collect-only today)

• In the same month, the py library gets split off from PyPy

• It seemed to get rather quiet for a while, and little seemed to happen between October 2004 (removing py from PyPy) and January 2007 (first commit in the now-pytest repository). However, there were various discussions about features/ideas on the mailinglist, and a couple of releases every couple of months:
  – March 2006: py 0.8.0-alpha2
  – May 2007: py 0.9.0
  – March 2008: py 0.9.1 (first release to be found in the pytest changelog!)
  – August 2008: py 0.9.2

• In August 2009, py 1.0.0 was released, introducing a lot of fundamental features:
  – funcargs/fixtures
  – A plugin architecture which still looks very much the same today!
Various default plugins, including monkeypatch

Even back there, the FAQ said:

Clearly, [a second standard library] was ambitious and the naming has maybe haunted the project rather than helping it. There may be a project name change and possibly a split up into different projects sometime.

and that finally happened in November 2010, when pytest 2.0.0 was released as a package separate from py (but still called py.test).

In August 2016, pytest 3.0.0 was released, which adds pytest (rather than py.test) as the recommended command-line entry point

Due to this history, it's difficult to answer the question when pytest was started. It depends what point should really be seen as the start of it all. One possible interpretation is to pick Europython 2004, i.e. around June/July 2004.

5.13 Historical Notes

This page lists features or behavior from previous versions of pytest which have changed over the years. They are kept here as a historical note so users looking at old code can find documentation related to them.

5.13.1 Marker revamp and iteration

Changed in version 3.6.

pytest's marker implementation traditionally worked by simply updating the __dict__ attribute of functions to cumulatively add markers. As a result, markers would unintentionally be passed along class hierarchies in surprising ways. Further, the API for retrieving them was inconsistent, as markers from parameterization would be stored differently than markers applied using the @pytest.mark decorator and markers added via node.add_marker.

This state of things made it technically next to impossible to use data from markers correctly without having a deep understanding of the internals, leading to subtle and hard to understand bugs in more advanced usages.

Depending on how a marker got declared/changed one would get either a MarkerInfo which might contain markers from sibling classes, MarkDecorators when marks came from parameterization or from a node.add_marker call, discarding prior marks. Also MarkerInfo acts like a single mark, when it in fact represents a merged view on multiple marks with the same name.

On top of that markers were not accessible in the same way for modules, classes, and functions/methods. In fact, markers were only accessible in functions, even if they were declared on classes/modules.

A new API to access markers has been introduced in pytest 3.6 in order to solve the problems with the initial design, providing the _pytest.nodes.Node.iter_markers() method to iterate over markers in a consistent manner and reworking the internals, which solved a great deal of problems with the initial design.
Updating code

The old `Node.get_marker(name)` function is considered deprecated because it returns an internal `MarkerInfo` object which contains the merged name, *args and **kwargs of all the markers which apply to that node.

In general there are two scenarios on how markers should be handled:

1. Marks overwrite each other. Order matters but you only want to think of your mark as a single item. E.g. `log_level('info')` at a module level can be overwritten by `log_level('debug')` for a specific test.

   In this case, use `Node.get_closest_marker(name)`:

   ```python
   # replace this:
   marker = item.get_marker("log_level")
   if marker:
       level = marker.args[0]
   
   # by this:
   marker = item.get_closest_marker("log_level")
   if marker:
       level = marker.args[0]
   ```

2. Marks compose in an additive manner. E.g. `skipif(condition)` marks mean you just want to evaluate all of them, order doesn't even matter. You probably want to think of your marks as a set here.

   In this case iterate over each mark and handle their *args and **kwargs individually.

   ```python
   # replace this
   skipif = item.get_marker("skipif")
   if skipif:
       for condition in skipif.args:
           # eval condition
           ...
   
   # by this:
   for skipif in item.iter_markers("skipif"):
       condition = skipif.args[0]
       # eval condition
   ```

If you are unsure or have any questions, please consider opening an issue.

Related issues

Here is a non-exhaustive list of issues fixed by the new implementation:

- Marks don't pick up nested classes (#199).
- Markers stain on all related classes (#568).
- Combining marks - args and kwargs calculation (#2897).
- `request.node.get_marker('name')` returns None for markers applied in classes (#902).
- Marks applied in parametrize are stored as markdecorator (#2400).
- Fix marker interaction in a backward incompatible way (#1670).
- Refactor marks to get rid of the current “marks transfer” mechanism (#2363).
- Introduce FunctionDefinition node, use it in generate_tests (#2522).
- Remove named marker attributes and collect markers in items (#891).
• skipif mark from parametrize hides module level skipif mark (#1540).
• skipif + parametrize not skipping tests (#1296).
• Marker transfer incompatible with inheritance (#535).

More details can be found in the original PR.

Note: in a future major release of pytest we will introduce class based markers, at which point markers will no longer be limited to instances of `Mark`.

5.13.2 cache plugin integrated into the core

The functionality of the core cache plugin was previously distributed as a third party plugin named `pytest-cache`. The core plugin is compatible regarding command line options and API usage except that you can only store/receive data between test runs that is json-serializable.

5.13.3 funcargs and pytest_funcarg_

In versions prior to 2.3 there was no `@pytest.fixture` marker and you had to use a magic `pytest_funcarg__NAME` prefix for the fixture factory. This remains and will remain supported but is not anymore advertised as the primary means of declaring fixture functions.

5.13.4 `@pytest.yield_fixture` decorator

Prior to version 2.10, in order to use a yield statement to execute teardown code one had to mark a fixture using the `yield_fixture` marker. From 2.10 onward, normal fixtures can use yield directly so the `yield_fixture` decorator is no longer needed and considered deprecated.

5.13.5 `[pytest] header in setup.cfg

Prior to 3.0, the supported section name was `[pytest]`. Due to how this may collide with some distutils commands, the recommended section name for `setup.cfg` files is now `[tool:pytest]`. Note that for `pytest.ini` and `tox.ini` files the section name is `[pytest]`.

5.13.6 Applying marks to `@pytest.mark.parametrize` parameters

Prior to version 3.1 the supported mechanism for marking values used the syntax:

```python
import pytest

@pytest.mark.parametrize(
    "test_input,expected", 
    ["3+5", 8], ["2+4", 6], pytest.mark.xfail(["6*9", 42])
)
def test_eval(test_input, expected):
    assert eval(test_input) == expected
```
This was an initial hack to support the feature but soon was demonstrated to be incomplete, broken for passing functions or applying multiple marks with the same name but different parameters.

The old syntax is planned to be removed in pytest-4.0.

5.13.7 @pytest.mark.parametrize argument names as a tuple

In versions prior to 2.4 one needed to specify the argument names as a tuple. This remains valid but the simpler "name1, name2,..." comma-separated-string syntax is now advertised first because it's easier to write and produces less line noise.

5.13.8 setup: is now an “autouse fixture”

During development prior to the pytest-2.3 release the name pytest.setup was used but before the release it was renamed and moved to become part of the general fixture mechanism, namely Autouse fixtures (fixtures you don’t have to request)

5.13.9 Conditions as strings instead of booleans

Prior to pytest-2.4 the only way to specify skipif/xfail conditions was to use strings:

```python
import sys

@pytest.mark.skipif("sys.version_info >= (3,3)")
def test_function(): ...
```

During test function setup the skipif condition is evaluated by calling `eval('sys.version_info >= (3,0)', namespace)`. The namespace contains all the module globals, and os and sys as a minimum.

Since pytest-2.4 boolean conditions are considered preferable because markers can then be freely imported between test modules. With strings you need to import not only the marker but all variables used by the marker, which violates encapsulation.

The reason for specifying the condition as a string was that pytest can report a summary of skip conditions based purely on the condition string. With conditions as booleans you are required to specify a reason string.

Note that string conditions will remain fully supported and you are free to use them if you have no need for cross-importing markers.

The evaluation of a condition string in `pytest.mark.skipif(conditionstring) or pytest.mark.xfail(conditionstring)` takes place in a namespace dictionary which is constructed as follows:

- the namespace is initialized by putting the `sys` and `os` modules and the pytest config object into it.
- updated with the module globals of the test function for which the expression is applied.

The pytest `config` object allows you to skip based on a test configuration value which you might have added:

```python
@pytest.mark.skipif("not config.getvalue('db')")
def test_function(): ...
```

The equivalent with “boolean conditions” is:
```python
@fixture

def test_function():
    pass

Note: You cannot use `pytest.config.getvalue()` in code imported before pytest’s argument parsing takes place. For example, `conftest.py` files are imported before command line parsing and thus `config.getvalue()` will not execute correctly.

### 5.13.10 `pytest.set_trace()`

Previous to version 2.4 to set a break point in code one needed to use `pytest.set_trace()`:

```python
import pytest

def test_function():
    ...
    pytest.set_trace()  # invoke PDB debugger and tracing
```

This is no longer needed and one can use the native `import pdb; pdb.set_trace()` call directly.

For more details see breakpoints.

### 5.13.11 “compat” properties

Access of `Module`, `Function`, `Class`, `Instance`, `File` and `Item` through `Node` instances have long been documented as deprecated, but started to emit warnings from pytest 3.9 and onward.

Users should just import `pytest` and access those objects using the `pytest` module.

### 5.14 Talks and Tutorials

#### 5.14.1 Books
