### **Overview**

docs	
tests	
package	

This is an implementation OMEMO Multi-End Message and Object Encryption in Python.

# 1.1 Installation

pip install python-omemo

# **1.2 Documentation**

https://python-omemo.readthedocs.org/

### **1.3 Development**

To set up python-omemo for local development:

- 1. Fork python-omemo on GitHub.
- 2. Clone your fork locally:

git clone git@github.com:your\_name\_here/python-omemo.git

3. Create a branch for local development:

git checkout -b name-of-your-bugfix-or-feature

Now you can make your changes locally.

4. Run all the checks, doc builder and spell checker with tox one command:

tox

### 1.3.1 Tips

To run a subset of tests:

```
tox -e envname -- py.test -k test_myfeature
```

To run all the test environments in *parallel* (you need to pip install detox):

detox

# **1.4 Contributing**

The **Python OMEMO** project direction is the sum of documented problems: everybody is invited to describe and discuss a problem in the issue tracker. Contributed solutions

encourage participation.

Some problem fields we initially focus on are:

- Creation of a reusable python omemo implementation
- Reusability bu the Gajim OMEMO plugin

# Installation

At the command line:

pip install python-omemo

Usage

To use Python OMEMO Library in a project:

import omemo

### Reference

### 4.1 OmemoState

```
class omemo.state.OmemoState(connection)
```

\_\_\_init\_\_\_(connection) Instantiates an OmemoState object.

Parameters connection - an sqlite3.Connection

\_\_module\_\_ = 'omemo.state'

add\_devices (*name*, *devices*) Return a an.

**Parameters** 

- **jid** (*string*) The contacts jid
- devices ([int]) A list of devices

```
add_own_devices (devices)
```

Overwrite the current :py:attribute:'OmemoState.own\_devices' with the given devices.

Parameters devices ([int]) - A list of device\_ids

build\_session (recipient\_id, device\_id, bundle\_dict)

bundle

create\_msg(from\_jid, jid, plaintext)

```
decrypt_msg(msg_dict)
```

```
device_ids = {}
```

**device\_list\_for** (*jid*) Return a list of known device ids for the specified jid.

Parameters jid (string) – The contacts jid

```
devices_without_sessions (jid)
```

List device\_ids for the given jid which have no axolotl session.

Parameters jid (string) – The contacts jid

**Returns** [int] – A list of device\_ids

```
encryption = None
```

get\_session\_cipher (jid, device\_id)

handlePreKeyWhisperMessage (recipient\_id, device\_id, key)

handleWhisperMessage (recipient\_id, device\_id, key)

own\_device\_id

own\_device\_id\_published()
Return True only if own device id was added via :py:method:'OmemoState.add\_own\_devices()'.

own\_devices = []

```
own_devices_without_sessions(own_jid)
```

List own device\_ids which have no axolotl session.

Parameters own\_jid (string) - Workaround for missing own jid in OmemoState

**Returns** *[int]* – A list of device\_ids

session\_ciphers = {}

# **Collective Code Construction Contract**

The **Collective Code Construction Contract (C4)** is an evolution of the github.com Fork + Pull Model, aimed at providing an optimal collaboration model for free software projects. This is revision 1 of the C4 specification.

### 5.1 License

Copyright (c) 2009-2015 Pieter Hintjens.

This Specification is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 3 of the License, or (at your option) any later version.

This Specification is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, see <a href="http://www.gnu.org/licenses">http://www.gnu.org/licenses</a>>.

### 5.2 Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119.

### 5.3 Goals

C4 is meant to provide a reusable optimal collaboration model for open source software projects. It has these specific goals:

- To maximize the scale of the community around a project, by reducing the friction for new Contributors and creating a scaled participation model with strong positive feedbacks;
- To relieve dependencies on key individuals by separating different skill sets so that there is a larger pool of competence in any required domain;
- To allow the project to develop faster and more accurately, by increasing the diversity of the decision making process;

- To support the natural life cycle of project versions from experimental through to stable, by allowing safe experimentation, rapid failure, and isolation of stable code;
- To reduce the internal complexity of project repositories, thus making it easier for Contributors to participate and reducing the scope for error;
- To enforce collective ownership of the project, which increases economic incentive to Contributors and reduces the risk of hijack by hostile entities.

# 5.4 Design

#### 5.4.1 Preliminaries

- The project SHALL use the git distributed revision control system.
- The project SHALL be hosted on github.com or equivalent, herein called the "Platform".
- The project SHALL use the Platform issue tracker.
- The project **SHOULD** have clearly documented guidelines for code style.
- A "Contributor" is a person who wishes to provide a patch, being a set of commits that solve some clearly identified problem.
- A "Maintainer" is a person who merges patches to the project. Maintainers are not developers; their job is to enforce process.
- Contributors SHALL NOT have commit access to the repository unless they are also Maintainers.
- Maintainers SHALL have commit access to the repository.
- Everyone, without distinction or discrimination, **SHALL** have an equal right to become a Contributor under the terms of this contract.

#### 5.4.2 Licensing and Ownership

- The project **SHALL** use a share-alike license, such as the GPLv3 or a variant thereof (LGPL, AGPL), or the MPLv2.
- All contributions to the project source code ("patches") SHALL use the same license as the project.
- All patches are owned by their authors. There SHALL NOT be any copyright assignment process.
- The copyrights in the project SHALL be owned collectively by all its Contributors.
- Each Contributor SHALL be responsible for identifying themselves in the project Contributor list.

#### 5.4.3 Patch Requirements

- Maintainers and Contributors **MUST** have a Platform account and **SHOULD** use their real names or a well-known alias.
- A patch SHOULD be a minimal and accurate answer to exactly one identified and agreed problem.
- A patch **MUST** adhere to the code style guidelines of the project if these are defined.
- A patch MUST adhere to the "Evolution of Public Contracts" guidelines defined below.

- A patch **SHALL NOT** include non-trivial code from other projects unless the Contributor is the original author of that code.
- A patch MUST compile cleanly and pass project self-tests on at least the principle target platform.
- A patch commit message **SHOULD** consist of a single short (less than 50 character) line summarizing the change, optionally followed by a blank line and then a more thorough description.
- A "Correct Patch" is one that satisfies the above requirements.

#### **5.4.4 Development Process**

- Change on the project **SHALL** be governed by the pattern of accurately identifying problems and applying minimal, accurate solutions to these problems.
- To request changes, a user SHOULD log an issue on the project Platform issue tracker.
- The user or Contributor SHOULD write the issue by describing the problem they face or observe.
- The user or Contributor **SHOULD** seek consensus on the accuracy of their observation, and the value of solving the problem.
- Users **SHALL NOT** log feature requests, ideas, suggestions, or any solutions to problems that are not explicitly documented and provable.
- Thus, the release history of the project SHALL be a list of meaningful issues logged and solved.
- To work on an issue, a Contributor SHALL fork the project repository and then work on their forked repository.
- To submit a patch, a Contributor SHALL create a Platform pull request back to the project.
- A Contributor SHALL NOT commit changes directly to the project.
- If the Platform implements pull requests as issues, a Contributor MAY directly send a pull request without logging a separate issue.
- To discuss a patch, people MAY comment on the Platform pull request, on the commit, or elsewhere.
- To accept or reject a patch, a Maintainer SHALL use the Platform interface.
- Maintainers **SHOULD NOT** merge their own patches except in exceptional cases, such as non-responsiveness from other Maintainers for an extended period (more than 1-2 days).
- Maintainers SHALL NOT make value judgments on correct patches.
- Maintainers SHALL merge correct patches from other Contributors rapidly.
- The Contributor MAY tag an issue as "Ready" after making a pull request for the issue.
- The user who created an issue SHOULD close the issue after checking the patch is successful.
- Maintainers **SHOULD** ask for improvements to incorrect patches and **SHOULD** reject incorrect patches if the Contributor does not respond constructively.
- Any Contributor who has value judgments on a correct patch SHOULD express these via their own patches.
- Maintainers MAY commit changes to non-source documentation directly to the project.

#### 5.4.5 Creating Stable Releases

- The project **SHALL** have one branch ("master") that always holds the latest in-progress version and **SHOULD** always build.
- The project SHALL NOT use topic branches for any reason. Personal forks MAY use topic branches.

- To make a stable release someone **SHALL** fork the repository by copying it and thus become maintainer of this repository.
- Forking a project for stabilization MAY be done unilaterally and without agreement of project maintainers.
- A stabilization project **SHOULD** be maintained by the same process as the main project.
- A patch to a stabilization project declared "stable" SHALL be accompanied by a reproducible test case.

#### 5.4.6 Evolution of Public Contracts

- All Public Contracts (APIs or protocols) SHALL be documented.
- All Public Contracts SHOULD have space for extensibility and experimentation.
- A patch that modifies a stable Public Contract **SHOULD** not break existing applications unless there is overriding consensus on the value of doing this.
- A patch that introduces new features to a Public Contract SHOULD do so using new names.
- Old names **SHOULD** be deprecated in a systematic fashion by marking new names as "experimental" until they are stable, then marking the old names as "deprecated".
- When sufficient time has passed, old deprecated names SHOULD be marked "legacy" and eventually removed.
- Old names SHALL NOT be reused by new features.
- When old names are removed, their implementations **MUST** provoke an exception (assertion) if used by applications.

### 5.4.7 Project Administration

- The project founders SHALL act as Administrators to manage the set of project Maintainers.
- The Administrators SHALL ensure their own succession over time by promoting the most effective Maintainers.
- A new Contributor who makes a correct patch **SHALL** be invited to become a Maintainer.
- Administrators **MAY** remove Maintainers who are inactive for an extended period of time, or who repeatedly fail to apply this process accurately.
- Administrators **SHOULD** block or ban "bad actors" who cause stress and pain to others in the project. This should be done after public discussion, with a chance for all parties to speak. A bad actor is someone who repeatedly ignores the rules and culture of the project, who is needlessly argumentative or hostile, or who is offensive, and who is unable to self-correct their behavior when asked to do so by others.

### 5.4.8 Further Reading

- Argyris' Models 1 and 2 the goals of C4.1 are consistent with Argyris' Model 2.
- Toyota Kata covering the Improvement Kata (fixing problems one at a time) and the Coaching Kata (helping others to learn the Improvement Kata).

#### 5.4.9 Implementations

- The ZeroMQ community uses the C4.1 process for many projects.
- OSSEC uses the C4.1 process.

• The Machinekit community uses the C4.1 process.

# Authors

- Bahtiar kalkin- Gadimov https://github.com/kalkin
- Daniel Gultsch https://github.com/inputmice
- Tarek Galal https://github.com/tgalal (original axolotl store implementation)

CHAPTER 7

Changelog

# 7.1 0.1.0 (2016-01-11)

• First release on PyPI.

CHAPTER 8
