
Python Wars Solo Documentation

Release 1.0.0

Daniel Greenfeld

Sep 27, 2017

Contents

1 Features	3
2 Usage	5
3 Contents	7
3.1 History of Python Wars Solo	7
3.2 Reference: Stuff	8
4 Indices and tables	9
Python Module Index	11

My retro-style Python clone of a Apple][Basic game I made back around 1982.

CHAPTER 1

Features

- Command the Battle Cruiser Pythonista!
- Fight the good fight against the evil Zargons
- Use your ship's spinal mounted beam cannon to slice and dice the enemy to pieces!
- Launch missiles to destroy Zargons in single shots
- Fight up to 9 enemies!
- Old school text based game
- Easy to learn
- Addictive

CHAPTER 2

Usage

From the command-line:

```
python go.py
```

History of Python Wars Solo

Python Wars Solo is the result of a few hours effort roughly duplicating a text-based Star Trek game I wrote back in 1980-1981. You fought up to 9 Klingons in your Enterprise. Beating one was a piece of cake. Three was a fun challenge. Five was tough. Seven was done only a few times. Nine was never done. The game was simple, fast, easy to learn, and tons of fun.

Now I don't remember much about the mechanics of the code I wrote back in High School. So when I started writing Python Wars Solo I decided not to worry about it. I would code how I felt like coding, and just create a game.

There were a few false starts. I kept trying to add tons of complexity to the code, or lots of neat features. Lots of time was wasted and not much was done. The technical term for what I was doing is 'Scope Creep'. Then someone advised that I just make it really simple and get it done.

And I did. I got it done.

To avoid potential yet likely silly copyright/trademark issues, I renamed the ship the '*Pythonista*'. The enemies are the evil '*Zargons*'.

Future Version Thoughts

Originally I thought of expanding this out to become a game with graphics and maybe a campaign. Then I went onto other things and got too preoccupied. But here was my original list of things to add:

- Keep basic mechanics
- Add 2-D map
- Incorporate PyGame
- Since all components are objects on ship objects which exist in the space object, current version could easily be expanded:
- Let players build their own ships and use introspection to generate menus

- Damage the ship in ways so that parts get broken

Reference: Stuff

class `stuff.Component`

Parts of the ship

action ()

class `stuff.Cruiser` (*name='', id=''*)

damage_control ()

recharge ()

class `stuff.ECM`

action (*me=None, enemy=None*)

class `stuff.Frigate` (*name='', id='', dv=None*)

recharge ()

class `stuff.Missile`

action (*me=None, enemy=None*)

class `stuff.Pulsar`

action (*me=None, enemy=None*)

class `stuff.Ship`

The big ship object

take_damage (*damage*)

class `stuff.Spinal_Mount`

Big honking laster

action (*me=None, enemy=None*)

recharge ()

class `stuff.Universe`

Container for ships

list_ships ()

CHAPTER 4

Indices and tables

- `genindex`
- `modindex`
- `search`

S

stuff, 8

A

action() (stuff.Component method), 8
action() (stuff.ECM method), 8
action() (stuff.Missile method), 8
action() (stuff.Pulsar method), 8
action() (stuff.Spinal_Mount method), 8

C

Component (class in stuff), 8
Cruiser (class in stuff), 8

D

damage_control() (stuff.Cruiser method), 8

E

ECM (class in stuff), 8

F

Frigate (class in stuff), 8

L

list_ships() (stuff.Universe method), 8

M

Missile (class in stuff), 8

P

Pulsar (class in stuff), 8

R

recharge() (stuff.Cruiser method), 8
recharge() (stuff.Frigate method), 8
recharge() (stuff.Spinal_Mount method), 8

S

Ship (class in stuff), 8
Spinal_Mount (class in stuff), 8
stuff (module), 8

T

take_damage() (stuff.Ship method), 8

U

Universe (class in stuff), 8
