Contents:

A Python library for generating TOTP and HOTP one-time passwords.

Author: Abdullah Selek

1.1 Installation

From PyPI

```
$ pip install totpy
```

From source

Install dependencies using *pip*:

```
$ pip install -r requirements.txt
```

Download the latest *totpy* library from: <https://github.com/abdullahselek/totpy>

Extract the source distribution and run:

```
$ python setup.py build
$ python setup.py install
```

1.2 Running Tests

The test suite can be run against a single Python version which requires `pip install pytest` and optionally `pip install pytest-cov` (these are included if you have installed dependencies from `requirements.testing.txt`)

To run the unit tests with a single Python version:

```
$ py.test -v
```

to also run code coverage:

```
$ py.test -v --cov-report html --cov=totppy
```

To run the unit tests against a set of Python versions:

```
$ tox
```

1.3 Getting the code

The code is hosted at [Github](#).

Check out the latest development version anonymously with:

```
$ git clone https://github.com/abdullahselek/totppy.git
$ cd totpy
```

2.1 totpy

class totpy.generator.**Factor** (*digits=6, period=30*)

Bases: object

The possible values are *digits* and *period*, with associated values for each.

class totpy.generator.**Generator** (*factor, algorithm, secret*)

Bases: object

password (*date*)

Returns a onetime use password. Args:

date (datetime): The target time, represented as a *datetime*.

Returns: The generated password.

class totpy.enums.**Algorithm**

Bases: enum.Enum

SHA1 = 1

SHA256 = 2

SHA512 = 3

class totpy.enums.**Error**

Bases: enum.Enum

INVALID_DIGITS = 3

INVALID_PERIOD = 2

INVALID_TIME = 1

totpy.crypto.**HMAC** (*algorithm, key, data*)

Return a new hmac object. Args:

algorithm (enum): Enum type from *Algorithm*.

key (str): Key for the keyed hash object.

data (bytes): Initial input for the hash, if provided.

`totpy.base32helper.decode(bytes_to_decode)`

Decodes given bytes with base32. Args:

bytes_to_decode (bytes): bytes to be decoded.

Returns: Base32 decoded str.

`totpy.base32helper.encode(str_to_encode)`

Encodes given str with base32. Args:

str_to_encode (str): str to be encoded.

Returns: Base32 encoded bytes.

CHAPTER 3

Indices and tables

- `genindex`
- `modindex`
- `search`

t

`totppy.base32helper`, 6

`totppy.crypto`, 5

`totppy.enums`, 5

`totppy.generator`, 5

A

Algorithm (class in `totpy.enums`), 5

D

`decode()` (in module `totpy.base32helper`), 6

E

`encode()` (in module `totpy.base32helper`), 6

Error (class in `totpy.enums`), 5

F

Factor (class in `totpy.generator`), 5

G

Generator (class in `totpy.generator`), 5

H

`HMAC()` (in module `totpy.crypto`), 5

I

`INVALID_DIGITS` (`totpy.enums.Error` attribute), 5

`INVALID_PERIOD` (`totpy.enums.Error` attribute), 5

`INVALID_TIME` (`totpy.enums.Error` attribute), 5

P

`password()` (`totpy.generator.Generator` method), 5

S

`SHA1` (`totpy.enums.Algorithm` attribute), 5

`SHA256` (`totpy.enums.Algorithm` attribute), 5

`SHA512` (`totpy.enums.Algorithm` attribute), 5

T

`totpy.base32helper` (module), 6

`totpy.crypto` (module), 5

`totpy.enums` (module), 5

`totpy.generator` (module), 5
