# CHAPTER 1

---

## Installation

---

To install QuestradeAPI, you can use [pipenv](#) (or pip, of course):

```
pipenv install questradeapi
```

### 2.1 Prerequisites

If you are reading this quick start guide, it is assumed that you have an active Questrade trading account with which to use the API. If this is not the case, then I don't know what you are doing here \\_()\\_/.

### 2.2 Setup

In order to access Questrade's API, you need to authorize your application to use the API through your account. This can be done by following [this guide](#) from Questrade. Once this is done, you should be able to generate refresh tokens. This is important because you will need to feed one of those tokens to the Session in order to be able to perform API calls.

### 2.3 Using the API

A `Sessions` is used to make the different API calls. Given an initial refresh token, it automatically deals with the redeeming process to get access tokens.

The following code snippet initializes a session with a refresh token and performs some simple API calls.

```
import questradeapi as qapi

refresh_token = input('Refresh Token: ')
sess = qapi.Session(refresh_token)

id = sess.get_accounts()['accounts'][0]['number'] #Fetch first account ID.
positions = sess.get_positions(id)
balances = sess.get_balances(id)
```

Thorough documentation of the different available API calls can be found on Questrade's website [here](#).

### 3.1 Enumeration Values

Some API calls' parameters only accept specific string values. A list of those enumerations and their description can be found [here](#) on Questrade's website.

### 3.2 Data Structures

Some API calls' parameters requires `dict` of a specific structure to be passed. These data structures and utility methods to create them are documented in the *Data Structures* section.

### 3.3 Account Calls

`Session.get_time()`

Retrieve current server time.

**Returns** Dictionary containing the response properties.

**Return type** `dict`

`Session.get_accounts()`

Retrieves the accounts associated with the user on behalf of which the API client is authorized.

**Returns** Dictionary containing the response properties.

**Return type** `dict`

`Session.get_positions(id)`

Retrives positions in a specified account.

**Parameters** `id` (str) – Account number

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_balances(id)`

Retrieves per-currency and combined balances for a specified account.

**Parameters** `id` (str) – Account number

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_executions(id, start_time=None, end_time=None)`

Retrieves executions for a specific account.

**Parameters**

- `id` (str) – Account number
- `start_time` (datetime, optional) – Start of the time range. Defaults to today 00:00am.
- `end_time` (datetime, optional) – End of the time range. Defaults to today 11:59pm.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_orders(id, state_filter=None, start_time=None, end_time=None, order_ids=None)`

Retrieves orders for a specified account.

**Parameters**

- `id` (str) – Account number
- `state_filter` (str, {'All', 'Open', 'Close'}) – Retrieve all, active or closed orders.
- `start_time` (datetime, optional) – Start of the time range. Defaults to today 00:00am.
- `end_time` (datetime, optional) – End of the time range. Defaults to today 11:59pm.
- `order_ids` (int, optional) – Retrieve specific orders details.

---

**Note:** More details on allowed `state_filter` values can be found [here](#).

---

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_activities(id, start_time=None, end_time=None)`

Retrieve account activities, including cash transactions, dividends, trades, etc.

**Parameters**

- `id` (list of str) – Account number.
- `start_time` (datetime, optional) – Start of the time range. Defaults to today 12:00am.
- `end_time` (datetime, optional) – End of the time range Defaults to today 11:59pm.

**Returns** Dictionary containing the response properties.

**Return type** dict

## 3.4 Market Calls

`Session.get_symbols` (*names=None, ids=None, id=None*)

Retrieves detailed information about one or more symbol.

### Parameters

- **name** (list of str) – List of symbol names.
- **ids** (list of int) – List of symbol ids.
- **id** (int) – Internal symbol identifier. Mutually exclusive with ‘ids’ parameter.

### Returns

- dict – Dictionary containing the response properties.
- *Either list of names or ids can be specified, but not both. If ‘names’ is specified, it takes precedence over ‘ids’, which takes precedence over ‘id’.*

`Session.get_symbols_search` (*prefix, offset=None*)

Retrieves symbol(s) using several search criteria.

### Parameters

- **prefix** (str) – Prefix of a symbol or any word in the description.
- **offset** (int) – Offset in number of records from the beginning of a result set.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_option_chain` (*id*)

Retrieves an option chain for a particular underlying symbol.

**Parameters** **id** (int) – Internal symbol identifier.

`Session.get_markets` ()

Retrieves information about supported markets.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_quotes` (*id=None, ids=None*)

Retrieves a single Level 1 market data quote for one or more symbols.

### Parameters

- **id** (int) – Internal symbol identifier (mutually exclusive with ‘ids’ argument).
- **ids** (list of int) – List of symbol ids.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_quotes_options` (*filters=None, ids=None*)

Retrieves a single Level 1 market data quote and Greek data for one or more option symbols.

### Parameters

- **filters** (list of dict) – List of OptionIdFilter structures. See the utility function `questradeapi.utils.create_option_id_filter()`.

- **ids** (list of int) – List of option IDs.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_quotes_strategies(variants)`

Retrieve a calculated L1 market data quote for a single or many multi-leg strategies.

**Parameters** **variants** (list of dict) – List of StrategyVariantsRequest structures. See utility function `questradeapi.utils.create_strategy_variant_request()`.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.get_candles(id, start_time, end_time, interval)`

Retrieves historical market data in the form of OHLC candlesticks for a specified symbol. This call is limited to returning 2,000 candlesticks in a single response.

**Parameters**

- **id** (int) – Internal symbol identifier.
- **startTime** (datetime) – Beginning of the candlestick range.
- **endTime** (datetime) – End of the candlestick range.
- **interval** (str, {'OneMinute', 'TwoMinutes', 'ThreeMinutes', 'FourMinutes', 'FiveMinutes', 'TenMinutes', 'FifteenMinutes', 'TwentyMinutes', 'HalfHour', 'OneHour', 'TwoHours', 'FourHours', 'OneDay', 'OneWeek', 'OneMonth', 'OneYear'}) – Interval of a single candlestick.

---

**Note:** More details on allowed *interval* values can be found [here](#)

---

**Returns** Dictionary containing the response properties.

**Return type** dict

## 3.5 Order Calls

`Session.post_order(account_id, symbol_id, quantity, iceberg_quantity, limit_price, stop_price, all_or_none, anonymous, order_type, time_in_force, action, primary_route, secondary_route, order_id=None, impact=False)`

Allows to place/replace or estimate the impact of an order against a certain account.

**Parameters**

- **id** (str) – Account number against which the order is submitted.
- **order\_id** (int) – Order id of the order to be replaced.
- **symbol\_id** (int) – Internal symbol identifier.
- **quantity** (int) – Order quantity.
- **iceberg\_quantity** (int) – Iceberg instruction quantity.
- **limit\_price** (double) – Limit price.
- **stop\_price** (double) – Stop price.

- **all\_or\_none** (bool) – Whether all are none is enabled.
- **anonymous** (bool) – Whether anonymous is enabled.
- **order\_type** (str, 'Market', 'Limit', 'Stop', 'StopLimit', 'TrailStopInPercentage', 'TrailStopInDollar', 'TrailStopLimitInPercentage', 'TrailStopLimitInDollar', 'LimitOnOpen', 'LimitOnClose') – Order type.
- **time\_in\_force** (str, {'Day', 'GoodTillCanceled', 'GoodTillExtendedDay', 'GoodTillDate', 'ImmediateOrCancel', 'FillOrKill'}) – Order duration.
- **action** (str, {'Buy', 'Sell'}) – Order side.
- **primary\_route** (str, optional) – Primary order route. Defaults to 'AUTO'.
- **secondary\_route** (str, optional) – Secondary order route. Defaults to 'AUTO'.
- **impact** (bool) – Calculate impact instead of placing order.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.delete_order(order_id)`

Allows to cancel an existing order.

**Parameters**

- **account\_id** (str) – Account number.
- **order\_id** (int) – Internal identifier of the order.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.post_bracket_order(account_id, symbol_id, primary_route, secondary_route, components, impact=False)`

Allows to place/replace or estimate the impact of a bracket order against a certain account.

**Parameters**

- **account\_id** (str) – Account number.
- **symbol\_id** (int) – Internal symbol identifier.
- **primary\_route** (str, optional) – Primary order route. Defaults to 'AUTO'.
- **secondary\_route** (str, optional) – Secondary order route. Defaults to 'AUTO'.
- **components** (list of dict) – List of Bracket Order Components. See the utility function `questradeapi.utils.create_bracket_order_component()`.
- **impact** (bool) – Calculate impact instead of placing order.

**Returns** Dictionary containing the response properties.

**Return type** dict

`Session.post_multi_leg_strategy_order(account_id, symbol_id, limit_price, order_type, time_in_force, primary_route, secondary_route, legs, strategy, impact=False)`

Allows to place/replace or estimate the impact of a multi-leg strategy against a certain account.

**Parameters**

- **account\_id** (str) – Account number.
- **symbol\_id** (int) – Internal symbol identifier.

- **limit\_price** (double) – Limit price.
- **order\_type** (str, 'Market', 'Limit', 'Stop', 'StopLimit', 'TrailStopInPercentage', 'TrailStopInDollar', 'TrailStopLimitInPercentage', 'TrailStopLimitInDollar', 'LimitOnOpen', 'LimitOnClose') – Order type.
- **time\_in\_force** (str, {'Day', 'GoodTillCanceled', 'GoodTillExtendedDay', 'GoodTillDate', 'ImmediateOrCancel', 'FillOrKill'}) – Order duration.
- **primary\_route** (str, optional) – Primary order route. Defaults to 'AUTO'.
- **secondary\_route** (str, optional) – Secondary order route. Defaults to 'AUTO'.
- **legs** (list of dict) – List of InsertOrderLegData structures. See the utility function `questradeapi.utils.create_insert_order_leg_data()`.
- **strategy** (str, {'CoveredCall', 'MarriedPuts', 'VerticalCallSpread', 'VerticalPutSpread', 'CalendarCallSpread', 'CalendarPutSpread', 'DiagonalCallSpread', 'DiagonalPutSpread', 'Collar', 'Straddle', 'Strangle', 'ButterflyCall', 'ButterflyPut', 'IronButterfly', 'CondorCall', 'Custom'}) – Strategy type.
- **impact** (bool) – Calculate impact instead of placing order.

---

**Note:** More details on allowed *order\_type* values can be found [here](#)

---

---

**Note:** More details on allowed *time\_in\_force* values can be found [here](#)

---

---

**Note:** More details on allowed *strategy* values can be found [here](#)

---

**Returns** Dictionary containing the response properties.

**Return type** dict
