SECURITYTRAILSAPI

1.1 securitytrailsapi package

1.1.1 Submodules

1.1.2 securitytrailsapi.api_handler module

class securitytrailsapi.api_handler.**SecurityTrailsAPI** (*api_key*)

Bases: object

explore_ips (*ipaddress*)

Returns the neighbors in any given IP level range and allows you to explore closeby IP addresses.

Parameters **ipaddress** (*str, required*) – The ipaddress/range you wish to find neighbours for.

Returns A dict formatted response from the Security Trails API.

Return type dict

feeds_domains (*record_type, search_filter, tld, ns, date*)

Fetch zone files including authoritative nameservers.

Parameters

- **record_type** (*str, required*) – Valid domain values are “all”, “dropped”, “new” or “registered”
- **search_filter** (*str, optional*) – Valid filter values are “cctld” and “gtld”
- **tld** (*str, optional*) – Can be used to only return domains of a specific tld, such as “com”
- **ns** (*bool, optional*) – Show nameservers in the list.
- **date** (*str, option*) – Date to fetch data for, format YYYY-MM-DD, e.g. 2019-06-11. Default is today.

Returns A dict formatted response from the Security Trails API.

Return type dict

find_associated_domains (*domain, page*)

Find all domains that are related to the given domain.

Parameters

- **domain** (*str, required*) – The domain to find associated domains for.

- **page** (*int, optional*) – The page of the returned results.

Returns A dict formatted response from the Security Trails API.

Return type dict

get_domain (*domain*)

Returns the current data about the given domain. In addition to the current data, you also get the current statistics associated with a particular record. For example, for A records you'll get how many other domains have the same IP.

Parameters **domain** (*str, required*) – The domain to find associated domains for.

Returns A dict formatted response from the Security Trails API.

Return type dict

get_whois (*domain*)

Returns the current WHOIS data about a given domain with the stats merged together.

Parameters **domain** (*str, required*) – The domain to find WHOIS data for.

Returns A dict formatted response from the Security Trails API.

Return type dict

history_by_domain (*domain, page*)

Returns historical WHOIS information about the given domain.

Parameters

- **domain** (*str, required*) – The domain to find historical WHOIS data for.
- **page** (*int, optional*) – The page of the returned results.

Returns A dict formatted response from the Security Trails API.

Return type dict

history_by_record (*domain, record_type, page*)

Lists out specific historical information about the given hostname parameter.

Parameters

- **domain** (*str, required*) – The domain to find historical data for.
- **record_type** (*str, required*) – The record type to search for. Allowed values: a, aaaa, mx, ns, soa or txt
- **page** (*int, optional*) – The page of the returned results.

Returns A dict formatted response from the Security Trails API.

Return type dict

ip_search_stats (*query*)

Lists out specific historical information about the given hostname parameter.

Parameters **query** (*str, required*) – The API query e.g. *ptr_part='amazon.com'*.

Returns A dict formatted response from the Security Trails API.

Return type dict

list_subdomains (*domain*)

Returns subdomains for a given hostname.

Parameters **domain** (*str, required*) – The domain to find subdomains for.

Returns A dict formatted response from the Security Trails API.

Return type dict

list_tags (*domain*)

Returns tags for a given hostname.

Parameters **domain** (*str, required*) – The domain to find tags for.

Returns A dict formatted response from the Security Trails API.

Return type dict

ping ()

Use this function to test your authentication and access to the SecurityTrails API.

Returns A dict formatted response from the Security Trails API.

Return type dict

search_domain_dsl (*query, include_ips, page, scroll*)

Filter and search specific records using SecurityTrails DSL.

Parameters

- **query** (*str, required*) – A DSL query e.g. `whois_email='domain-contact@oracle.com'`.
- **include_ips** (*bool, optional*) – Resolves any A records and additionally returns IP addresses.
- **page** (*int, optional*) – The page of the returned results.
- **scroll** (*bool, option*) – Request scrolling. See [Scrolling API](#).

Returns A dict formatted response from the Security Trails API.

Return type dict

search_domain_filter (*search_filter, include_ips, page*)

Filter and search specific records.

Parameters

- **search_filter** – A search filter constructed from [SecurityTrailsAPIFilter](#).
- **include_ips** (*bool, optional*) – Resolves any A records and additionally returns IP addresses.
- **page** (*int, optional*) – The page of the returned results.

Returns A dict formatted response from the Security Trails API.

Return type dict

search_ips (*query, page*)

Search IP's using SecurityTrail's DSL.

Parameters

- **query** (*str, required*) – A DSL query e.g. `ptr_part='ns1'`.
- **page** (*int, optional*) – The page of the returned results.

Returns A dict formatted response from the Security Trails API.

Return type dict

search_statistics (*search_filter*)

Search IP's using SecurityTrail's DSL.

Parameters **search_filter** – A search filter constructed from *SecurityTrailsAPIFilter*.

Returns A dict formatted response from the Security Trails API.

Return type dict

usage ()

Return your current API usage stats.

Returns A dict formatted response from the Security Trails API.

Return type dict

class securitytrailsapi.api_handler.**SecurityTrailsAPIFilter**
