Contents:

seshypy makes API Gateway requests and API Gateway clients easy.

Features

- Make API Gateway signed requests.
- Helper methods for delete, get, post, and put.
- Permanent STS hops creds creds resolver.
- Session sharing.
- Method caching with TTL.
 - given secrets
 - resolved from shared credential) (using transparent STS or secrets)
 - given role (using shared credentials)
 - given secrets and role
- Multiple authentication methods.

Documentation

Documentation can be found at <https://seshypy.readthedocs.io/>.

Stable release

To install seshypy, run this command in your terminal:

```
$ pip install seshypy
```

This is the preferred method to install, as it will always install the most recent stable release.

If you don't have [pip](#) installed, this [Python installation guide](#) can guide you through the process.

From sources

The sources for howsitgoing can be downloaded from the [Github repo](#).

Clone the repository:

```
$ git clone git@github.com:cleardataeng/seshypy.git
```

Once you have a copy of the source, you can install it with:

```
$ python setup.py install
```

There are broadly two options for using seshypy. First, you can use it to create clients for calling API Gateway via specific method calls. For example, if you have a library catalog application, you could have a *books* session, that has the methods, *get_books*, *post_book*, etc. Those methods would know the route and make the call accordingly.

The second method, is to use it as a very client, that only manages your session. In that case, you simply create a *base_session*, then make the calls like, *sess.get("books/")* or *sess.post("books/", json=book_data)*.

Method 1 - specific client methods

```
# client.py
from builtins import super
from seshypy.base_session import BaseSession

class BookSession(BaseSession):
    """Api Gateway Calls and Helper Methods Pertaining to /books routes """
    def __init__(self, cache_methods=None, *args, **kwargs):
        cache_methods = cache_methods if cache_methods is not None else [
            'get_books',
        ]
        super().__init__(cache_methods=cache_methods, *args, **kwargs)

    def get_books(self):
        """Get books.

        Returns:
            list: boooks
        """
        path = 'books/'
        return self.get(path).json()
```

```
# caller.py
from client import BookSession
session = BookSession("https://yourapi.com", **creds)
books = session.get_books()
```

Method 2 - thin API method wrapper

```
# caller.py
from seshypy import BaseSession
session = BaseSession("https://yourapi.com", **creds)
books = session.get("books/").json()
```

Contributions are welcome. You can contribute in the following ways.

- report bugs
- fix bugs
- implement features
- write documentation
- submit feedback
