## Download

The Collectd module is available here:

- <https://github.com/shinken-monitoring/mod-collectd>

## Requirements

The Collectd module requires:

- Python 2.6+
- Shinken 2.0+

## Installation

Copy the collectd module folder from the git repository to your shinken/modules directory (set by *modules\_dir* in shinken.cfg)

### CLI installation

TODO

### Manual installation

For example, if your modules dir is `‘/var/lib/shinken/modules’`:

```
cd /var/lib/shinken/modules
wget https://github.com/shinken-monitoring/mod-collectd/archive/master.zip -O mod-
↳collectd.zip
unzip mod-collectd.zip
```

## Shinken Collectd module

### Collectd module declaration

Add and modify the following configuration in *collectd.cfg*

```
define module {
    module_name Collectd
    module_type collectd

    # Specify exact host (optional)
    host      0.0.0.0
    port      25826
    multicast False

    # Select which collectd plugin you want to group
    # Example :
    # grouped_collectd_plugins    cpu, df
    # This will group all 'cpu' plugin instances in one service called 'cpu' with all
    ↪perf datas : cpu-0-wait, cpu-1-wait, cpu-0-idle, cpu-1-idle, ....
    # AND yhis will group all 'df' plugin instances in one service called 'df' with
    ↪all perf datas : df-complex-root-free, ....
    # If grouped_collectd_plugins is empty
    # This will not group plugin instances and you will have this following services :
    ↪cpu-0, cpu-1, df-root, ...
    #
    # grouped_collectd_plugins
}
```

**Important:** You have to be sure that the *collectd.cfg* will be loaded by Shinken (watch in your *shinken.cfg*)

## Parameters details

**host** Bind address

**port** Bind port. Default: 25826

**multicast** ????? Default: False

**grouped\_collectd\_plugins** List of collectd plugins where plugin instances will be group by plugin. Default: *empty*. Example: *cpu,df,disk,interface*

## Receiver/Arbiter daemon configuration

Simply declare the module:

```
modules Collectd
```

## Collectd agent configuration

You have to configure your Collectd agents for they send datas to Shinken. In the `collectd.conf` file, you have to have:

```
LoadPlugin network
<Plugin network>
    Server "192.168.2.16" "25826"
</Plugin>
```

Where *192.168.2.16* is the Receiver/Arbiter IP.

---

Collectd Developer Reference

---

Collectd Plugin for Receiver or arbiter

```
class module.module.Collectd_arbiter (modconf, host, port, multi-
cast, grouped_collectd_plugins=None,
use_decicated_reader_thread=False)
```

Bases: BaseModule

Main class for this collectd module

**do\_loop\_turn** ()

```
class module.module.Element (host_name, sdesc, interval, last_sent=None)
```

Bases: object

Element store service name and all perfdatas before send it in a external command

**add\_perf\_data** (*mname, mvalues, mtime*)

Add perf datas to this element. :param mname: The metric name. :param mvalues: The metric read values.  
:param mtime: The “epoch” time when the values were read.

**get\_command** ()

Look if this element has data to be sent to Shinken. :return

- None if element has not all its perf data refreshed since last sent..
- The command to be sent otherwise.

**last\_full\_update**

**Returns** The last “full” update time of this element. i.e. the metric minimum last update own time.

**send\_ready**

**Returns** True if this element is ready to have its perfddata sent. False otherwise.

```
module.module.get_instance (plugin)
```

This function is called by the module manager to get an instance of this module

**m**

`module.module`, 5

## A

add\_perf\_data() (module.module.Element method), 5

## C

Collectd\_arbiter (class in module.module), 5

## D

do\_loop\_turn() (module.module.Collectd\_arbiter  
method), 5

## E

Element (class in module.module), 5

## G

get\_command() (module.module.Element method), 5

get\_instance() (in module module.module), 5

## L

last\_full\_update (module.module.Element attribute), 5

## M

module.module (module), 5

## S

send\_ready (module.module.Element attribute), 5
