
SIMBA_iOS *Documentation*

Release latest

Jul 02, 2018

1	Installation	3
2	Prerequisites	5
3	Usage	7
3.1	There are several views in the app	7
3.2	Modifying/Setting up “getting”	7
4	Links	9

CHAPTER 1

Installation

- Hit the “Clone or Download” button in upper right corner of the github page
- Hit the “Open in Xcode” button.
- Hit the “Open Xcode” button on the popup.
- Choose where you want to [save the project](#) and hit clone.
- Xcode should [open the project](#).

CHAPTER 2

Prerequisites

Note: These are already packaged in the app when you clone it.

- Alamofire
 - Swagger
-

3.1 There are several views in the app

- **View Controller** | This is the main view of the app here you can go to the other views as well as select an account.
- **Most Recent Audits Scene** | This is the view that displays the last 10 audits you can click on any of them.
- **Detail View Controller** | This is the view that pops up whenever you click on one of the last 10 audits.
- **Post View Controller** | This is the view where you can post items. Fields can be left empty or populated when posting.

3.2 Modifying/Setting up “getting”

- Change the URL in “**APIs.Swift**”
- Setup the model in “**Model.Swift**” under the folder “Models”
- Change the path in “**DefaultAPI.Swift**” under the folder “APIs”
- Setup the decoder in “**Models.Swift**”
- Change the **view controller** to use the right data for the model
- Change the **view layout and outlets** to fit the new model

[Swagger](#)
[AlamoFire](#)
[Github Repo](#)
[SIMBA Website](#)

Step 1

- Hit the “Clone or Download” button in upper right corner of the github page

A green rectangular button with the text 'Clone or download' in white, followed by a small white downward-pointing triangle.
