The account_dunning module adds dunning for receivable move lines.
A Procedure defines the dunning process with an ordered list of levels. A dunning will raise from one level to another by selecting the next level that pass the test. The Procedure is set per Party and a default one can be configured in the accounting configuration.
A Level defines the parameters to reach it:

- Days: The number of overdue days.
A *Dunning* defines the dunning level of an overdue move line. Once processed, it triggers the communication defined on the procedure level. It is mainly defined by:

- Line: The overdue move line
- Procedure: The *Procedure* followed.
- Level: The current *Level*.
- Blocked: If true, it blocks the dunning to raise.

The dunning can be in one of these states:

- Draft
  
  The current level is not yet processed.

- Done
  
  The current level has been processed.
