The carrier module defines the concept of carrier.

# CHAPTER 1

---

## Carrier

---

A carrier links a party with a product and cost method.

- The *Product* is the carrier service.
- The *Carrier Cost Method* defines how to compute the carrier cost. By default there is only the *Product Price* method which takes the *List Price* of the *Product* as sale price and the *Cost Price* of the *Product* as purchase price.
