# CHAPTER 1

---

## tx-manager-lambda

---

Lambda functions for tx Manager. Requires the [tx-manager library](<https://github.com/unfoldingWord-dev/tx-manager>).

Project description at <https://github.com/unfoldingWord-dev/door43.org/wiki/tX-Development-Architecture#tx-manager-lambda-module>.

Issue for its creation at <https://github.com/unfoldingWord-dev/door43.org/issues/53>

## CHAPTER 2

---

### Setting up as deployed in virtual environment

---

In IntelliJ terminal, switch to virtual environment and install requirements.

---

### Deploying your branch of tx-manager to AWS

---

For developing the tx-manager library which this repo uses for every function, you can deploy your code to a test AWS environment with apex by doing the following:

- Copy `project.test.json.sample` to `project.test.json`
- Edit `project.test.json` and change `<username>` and `<branch>` to your tx-manager branch
- Install apex from <http://apex.run/#installation>
- Set up your AWS credentials as specified at <http://apex.run/#aws-credentials>
- Run `apex deploy -env test` to deploy all functions, or `apex deploy -env test [function-name]` for a single function

For more information on using `-env` to specify a project json file, see <https://github.com/apex/apex/blob/master/docs/projects.md#multiple-environments>

## CHAPTER 4

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
