The UI Patterns module allows developers to define self-contained UI patterns as Drupal plugins and use them seamlessly in their panels, field groups or Display Suite view modes.

The module also generates a pattern library page to be used as documentation for content editors or as a showcase for business like the one shown below:

Project overview

The UI Patterns project provides 3 modules:

- **UI Patterns** (machine name `ui_patterns`): the main module that defines the UI Pattern plugin type and integrates defined patterns with Drupal's theme system.
- **UI Patterns Field Group** (machine name `ui_patterns_field_group`): allows to use patterns to format field groups provided by the [Field group](#) module.
- **UI Patterns Layouts** (machine name `ui_patterns_layouts`): allows to use patterns as layouts provided by the [Layout plugin](#) module. This allows patterns to be used on [Display Suite](#) view modes or on [panels](#) out of the box.

1.1 Define your patterns

UI patterns can be exposed by both modules and themes: all defined patterns will be collected and managed by a centralized UI Pattern plugin manager.

Since the plugin manager uses a [YAML discovery method](#) to define your patterns you simply create a YAML file named `MY_MODULE.ui_patterns.yml` or `MY_THEME.ui_patterns.yml` and list them using the following format:

```
blockquote:
  theme hook: blockquote_custom
  label: Blockquote
  description: Display a quote with attribution information.
  fields:
    quote:
      type: text
      label: Quote
      description: Quote text.
      preview: Life is like riding a bicycle. To keep your balance, you must keep moving.
    attribution:
      type: text
      label: Attribution
      description: Quote attribution.
      preview: Albert Einstein
  libraries:
    - module/library1
    - module/library2
```

Let's break this down:

id The root of a new pattern definition (`blockquote` in the example above). it must contain only lowercase characters, numbers and underscores (i.e. it should validate against `[^a-z0-9_]+`).

theme hook If specified it overrides the automatically derived theme hook described above.

label Pattern label, used on pattern library page.

description Pattern description, used on pattern library page.

fields Hash defining the pattern fields. Each field must have the following properties defined below.

type Field type, can be `text`, `numeric`, etc. only for documentation purposes, at the moment.

label Field label, used on pattern library page.

description Field description, used on pattern library page.

preview Preview content, used on pattern library page. It can be either a string or a Drupal render array.

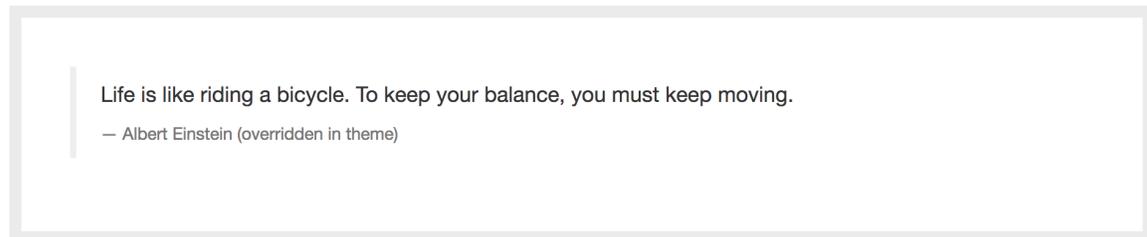

libraries Libraries that are to be loaded when rendering the pattern. UI patterns are supposed to be self-contained so they should load along all libraries that are needed for a proper rendering.

The `blockquote` pattern defined above will be rendered in the pattern library as follow:

Blockquote

Display a quote with attribution information.

ID	Field	Description
<code>quote</code>	Quote	Quote text.
<code>attribution</code>	Attribution	Quote attribution.

While the Twig template file for such a pattern would look like:

```
<blockquote>
  <p>{{ quote }}</p>
  <footer>{{ attribution }} (overridden in theme)</footer>
</blockquote>
```

See `tests/target/custom/ui_patterns_test_theme/templates/blockquote-custom.html.twig`.
