# CHAPTER 1

---

## Introduction

---

A pure python module for working with WAVE files with support for all common file formats for both RIFF and RIFX.

When working with WAVE files, there are two main pure python modules available:

- ***builtin.wave*** Python built-in module, lacks support for float and 24bit integer. Provides raw data instead of an array of values.
- ***scipy.wave*** Scipy does not support 24bit integer files. The module strength and weakness is its simplicity, if all you need to do is read and write, this might be for you.

The **wave** module provides a fully featured, dedicated module that can be used as an alternative to the above if flexibility and ease of use are desirable.

## CHAPTER 2

---

### Comparison

---

The following table shows a comparison of supported functionality:

Functionality	builtin.wave	scipy.wave	wavy
<b>RIFF Format Support</b>			
<b>RIFX Format Support</b>			
<b>Read Audio Information</b>			
<b>Read Data As Array</b>			
<b>Read Tag Information</b>			

The following table shows a comparison of supported formats for uncompressed WAVE files:

Sample Width	Format Tag	builtin.wave	scipy.wave	wavy
<b>8 bit</b>	PCM			
	EXTENSIBLE			
<b>16 bit</b>	PCM			
	EXTENSIBLE			
<b>24 bit</b>	PCM			
	EXTENSIBLE			
<b>32 bit</b>	PCM			
	EXTENSIBLE			
	FLOAT			
<b>64 bit</b>	FLOAT			

## CHAPTER 3

---

### Installation

---

The latest stable version is available on [PyPI](#).

Either add `wavy` to your `requirements.txt` file or install with `pip`:

```
pip install wavy
```

### 4.1 Read File

Open a file using the module use `wavy.read`:

```
>>> import wavy
>>> file = wavy.read("audio.wav")
>>> file
WaveFile(sample_width=16, framerate=44100, n_channels=2, n_frames=286653)
```

Get the data for the file:

```
>>> rate, data = file.framerate, file.data

>>> rate
44100

>>> data.shape
(286653, 2)

>>> data.dtype
int16
```

### 4.2 Get File Info

To read the file information without loading the data use `wavy.info`:

```
>>> wavy.info("audio.wav")
WaveFileInfo(sample_width=16, framerate=44100, n_channels=2, n_frames=286653,
↳tags=None)
```

## 5.1 Functions

`wavy.read(file)`

Read the the audio file.

**Parameters** `file` (*str* or *File*) – Either the path to the file or an instance of *File*.

**Returns** An object that represents the file.

**Return type** *WaveFile*

`wavy.info(file)`

Returns information about the audio file.

**Parameters** `file` (*str* or *File*) – Either the path to the file or an instance of *File*.

**Returns** Information about the file.

**Return type** *WaveFileInfo*

## 5.2 Objects

**class** `wavy.WaveFile` (*sample\_width, framerate, data, tags=None*)

Class that represents a WAVE file.

**data**

*numpy.ndarray* – Audio data stored in *numpy.ndarray*. If the number of channels is one, the array will be one dimensional. Otherwise, the returned array will be two dimensional array of shape (n\_frames, n\_channels).

**framerate**

*int* – Sampling frequency (Hz).

**n\_channels**

*int* – Number of audio channels.

**n\_frames**

*int* – Number of audio frames.

**sample\_width**

*int* – Sample width in bits.

**tags**

TODO

A pure python module for working with WAVE files with support for all common file formats for both RIFF and RIFX.

When working with WAVE files, there are two main pure python modules available:

- ***builtin.wave*** Python built-in module, lacks support for float and 24bit integer. Provides raw data instead of an array of values.
- ***scipy.wave*** Scipy does not support 24bit integer files. The module strength and weakness is its simplicity, if all you need to do is read and write, this might be for you.

The **wave** module provides a fully featured, dedicated module that can be used as an alternative to the above if flexibility and ease of use are desirable.

## CHAPTER 7

---

### Comparison

---

The following table shows a comparison of supported functionality:

Functionality	builtin.wave	scipy.wave	wavy
<b>RIFF Format Support</b>			
<b>RIFX Format Support</b>			
<b>Read Audio Information</b>			
<b>Read Data As Array</b>			
<b>Read Tag Information</b>			

The following table shows a comparison of supported formats for uncompressed WAVE files:

Sample Width	Format Tag	builtin.wave	scipy.wave	wavy
<b>8 bit</b>	PCM			
	EXTENSIBLE			
<b>16 bit</b>	PCM			
	EXTENSIBLE			
<b>24 bit</b>	PCM			
	EXTENSIBLE			
<b>32 bit</b>	PCM			
	EXTENSIBLE			
	FLOAT			
<b>64 bit</b>	FLOAT			

## CHAPTER 8

---

### Installation

---

The latest stable version is available on [PyPI](#).

Either add `wavy` to your `requirements.txt` file or install with `pip`:

```
pip install wavy
```

### 9.1 Read File

Open a file using the module use `wavy.read`:

```
>>> import wavy
>>> file = wavy.read("audio.wav")
>>> file
WaveFile(sample_width=16, framerate=44100, n_channels=2, n_frames=286653)
```

Get the data for the file:

```
>>> rate, data = file.framerate, file.data

>>> rate
44100

>>> data.shape
(286653, 2)

>>> data.dtype
int16
```

### 9.2 Get File Info

To read the file information without loading the data use `wavy.info`:

```
>>> wavy.info("audio.wav")
WaveFileInfo(sample_width=16, framerate=44100, n_channels=2, n_frames=286653, ↵
↳tags=None)
```

### D

`data` (`wavy.WaveFile` attribute), [9](#)

### F

`framerate` (`wavy.WaveFile` attribute), [9](#)

### I

`info()` (in module `wavy`), [9](#)

### N

`n_channels` (`wavy.WaveFile` attribute), [9](#)

`n_frames` (`wavy.WaveFile` attribute), [9](#)

### R

`read()` (in module `wavy`), [9](#)

### S

`sample_width` (`wavy.WaveFile` attribute), [10](#)

### T

`tags` (`wavy.WaveFile` attribute), [10](#)

### W

`WaveFile` (class in `wavy`), [9](#)
